THE TRADER PUBLISHING CO.,
No. 13 Adelaide Street East, Toronto, Ont

Editorial.

HOW DO YOU STAND ?

Stock taking is not one of the most attractive jobs in the world, but its necessity is so great, that even at the risk of raising considerable dust, good business men tackle it and submit to its inconvenience, although it may be from a sense of duty rather than pleasure.

Stock taking is the pulse of any business, and by the results and indications a merchant can form a tolerably correct idea of whether his business is healthy or the reverse.

At this season of the year, when the rush of the holiday trade has subsided, most merchants have a short breathing spell, and in no way do we think it could be more profitably employed than in taking stock, making up accounts and balancing one's books.

A great many merchants, we are sorry to say, seem to think that these operations are only secondary to that of selling goods, but we think that every merchant of experience will bear us out in the statement, that they are of paramount importance to any successful business, and should not be neglected or made to give way for anything else.

By such methods, and such methods only, can any business man determine his standing, how his business is progressing, whether he is making or losing money, what particular lines in his business pay him and what do not, in fact, an intelligent appreciation of the benefits of such a course, and the ability to put its lessons into practice in many cases make the difference between success and failure.

The merchant who tries to do business without the aid of these safeguards is pretty much in the same position as the captain who would put to sea without quadrant or compass. If either merchant or seaman ever reached the haven of their hopes, it would certainly be more the result of luck than intelligent guidance.

However much luck may have had to do with business in days gone by, it has but little concern with it at present, and the successful man of to-day is generally one who trusts, not to luck, but to an intelligent use of the brains nature has endowed him with.

We would advise all our readers who have hitherto neglected stock taking and balancing their books, to commence as soon as possible, and we are satisfied that if they do it thoroughly one year, they will be so well satisfied with the information they have obtained about their own business that they will never again neglect it.

A WARNING.

We learn from the Ottawa correspondent of one of our daily papers that extensive seizures of smuggled jewelry have been made within the past few days in Toronto, Kingston, Belleville, London, Hamilton and Guelph. It appears that when Mr. W. H. Patterson of Boston, Mass., U. S. A. was nabbed, and his contraband importations confiscated by the Canadian Customs authorities, he with the usual courage and kind feeling of his class, at once undertook to see that the retail dealers who had purchased his goods were placed in a position to sympathize with his misfortune, by having their own purchases from him, also seized and confiscated by the government. Perhaps Mr. Patterson was frightened into this action, or it may have been done solely on the plea that "misery loves company," but whatever was the reason, every honest-minded man must consider it a most contemptible piece of business for any person to induce another to purchase contraband goods and then when detected himself, to deliberately sacrifice his former friends and dupes.

The information from Ottawa seems to assert that the retail dealers whose goods were seized and confiscated, were in collusion with Patterson, and that in fact they were a gang regularly organized for the purpose of smuggling and disposing of jewelry and other valuable goods.

We are very much disposed to question the correctness of this assertion; while most of the dealers no doubt knew from the prices that they were buying smuggled goods, but few if any of them could have been connected with Mr. Patterson in any other way than the simple and usual business connection of buyer and seller. That this was the case, and that in some instances they were the innocent victims of misplaced confidence will be quite evident to any person at all acquainted with the Canadian retail jewelry trade, and though it will be hard on the sufferers it will we trust be a lesson that will not be thrown away on them.

Any retail jeweler well up in his business knows that on certain staple articles, there is a standard market price, below which they cannot possibly go. Any wholesaler or manufacturer selling them at lower prices might as well try to make money by selling quarter dollars for twenty cents, and the dealer may be sure than when such goods are offered below their regular market value, that either the quality is not up to the standard, or that "there is something rotten in the State of Denmark." If they are imported goods he may be sure they have been smuggled, and are therefore liable to seizure at any time by the Customs authorities. It is a somewhat singular thing that merchants will deliberately run such a risk in preference to paying the slight advance asked by legitimate wholesale dealers who import their goods in the regular orthodox manner required by law.

Some of these smart retail merchants who have hitherto laughed at the higher priced but honest Canadian wholesaler, will probably now feel sorry that they did not buy their "*straight*," instead of the foreigners "*crooked*" goods, but this feeling we are afraid will be more on account of their detection and loss than for any sorrow they feel at their having aided in trying to ruin the wholesale trade of their own country.

We trust that the lesson will not be lost on them however, and that when next some enterprising though irresponsible drummer, offers them goods at less than honest prices, they will be ordered Satan like "to get behind them."

This should be a warning to all retail merchants to refuse to buy goods from irresponsible persons, who have no stake in the country, and who, not being able to buy as well as the regular Canadian dealers, can only undersell them by smuggling in their goods. All such goods are dangerous, and the retail trade should in all cases refuse to be a party to such a

swindle against the Government of the country. It is manifestly in the interest of Canadian retailers to buy from Canadian wholesale houses in preference to such men as Patterson and a half a dozen others of that ilk, not only because the regular home dealers can supply them with goods as cheaply as outsiders can, but also because the interests of the wholesaler and retailer are common and identical.

We trust that these customs seizures will not be thrown away, but that their effect may be to keep out of this country entirely, the gang of dishonest wholesale peddlers that have of late years almost demoralized the trade.

THE TRADE BAROMETER FOR 1881.

To every one interested in the welfare of Canada, the annual circular of Messrs. Dun ,Wiman & Co. is a cheering document, inasmuch as by its figures it clearly demonstrates that it is no ephemeral era of prosperity with which we have been visited, but one that with prudence and foresight on the part of our business men may be lengthened out indefinitely. In order to give our readers a better idea of the improved condition of the country we have been at considerable pains to put before them a comparative statement of all the failures in this country since 1875, from which it will be seen at a glance that the storm pressure has been removed and that our commercial barometer now indicates improved financial weather.

Year.	No. of Failures.	Amount of Liabilities.
1874	966	$ 7,696,765
1875	1,968	28,843,967
1876	1,728	25,517,991
1877	1,892	25,523,903
1878	1,697	23,908,677
1879	1,902	29,347,937
1880	907	7,988,077
1881	637	5,770,717

The following table shews the number and amount of insolvencies in each quarter of the year just ended :

Year.	No. of Failures.	Amount of Liabilities.
1881—1st quarter	166	$2,026,556
1881—2nd "	183	1,876,302
1881—3rd "	180	787,889
1881—4th "	108	1,079,970
Total..	637	$5,770,717

The following table shews the difference in the half yearly statements between last year and the one previous :

	No. of Failures.	Amount of Liabilities.
1880—1st 6 months	649	$5,660,848
1881—1st 6 months	349	3,902,858
Difference..	300	$1,757,990
1880—2nd 6 months	258	$2,327,229
1881—2nd 6 months	288	1,867,859
Difference..	30	$459,370

The following table shews the amount and proportion of failures to the number engaged in business during the years mentioned :

Year.	No. in Business.	No. of Failures.	Per Cent. of Failures.	Amount of Liabilities.	Average Liability of each Insolvent.
1878	56,347	1,697	1 in every 33	$23,908,677	$14,088
1879	55,964	1,902	" 29	29,349,937	15,430
1880	57,100	907	" 63	7,988,077	8,807
1881	59,116	637	" 93	5,770,717	9,057

From the above tables it will be seen that this country is now in a more prosperous condition than at any period since 1873. Last year we had the pleasure of congratulating our readers upon the improved condition of affairs, and we are glad to have the same privilege again, as this year shows a decrease in the total number of failures of 270, and a decrease in the amount of liabilities of $2,217,360.

Encouraging as these figures are, they do not indicate that we have yet attained anything like the commercial soundness and stability that we might attain, if our merchants, both wholesale and retail, were to exercise more caution in their manner of giving credits, and a nearer approach to a cash system of doing business.

Although the United States is considered by many Canadians to be commercially unsound, its returns for the past year shew that it stands very much higher in financial stability than this country. In Canada for the past year, which is far ahead of any year in the last decade, there was *one failure for every ninety-three engaged in business*, in the United States, although having nearly one thousand more failures last year than the year previous, the average number of failures was only *one for every three hundred and forty engaged in business.* There are several reasons for this great difference between the failures of the two countries, but the principal one is that our neighbours have learned by sad experience that the nearer they can work to a cash basis the better for them. More than double the proportionate amount of cash business is done in the United States than is done in Canada, and where credit is given, as a rule, it is for much shorter dates. The wisdom of this system is apparent from the figures we give above.

We would be derelict in our duty, did we not sound a note of warning to those, who thinking that our prosperity cannot possibly come to an end, are rushing into all sorts of extravagance in their personal and business expenditure, or who from a similiar cause have been led into giving unwise and injudicious credits, or locking in outside speculation, however promising, the capital that should be held sacred for their business needs.

To these and all the unthinking, we would point to the fact that in the second half of the past year, the failures show an increase of thirty over the year previous. This simply means that there are too many people in business in Canada, and that those who do not strictly adhere to sound business principles must of necessity go the wall. The increase in the time, and ease of their terms of credit, are the premonitary symptoms of a commercial reaction which can only be averted by a strict adhesion on the part of our whole business community to the principles governing business. Although we sound this warning note, we do not wish to be considered by any means as taking a pessamist view of the situation ; on the contrary, we think the outlook is hopeful, and gives every indication of continued prosperity if we are only true to ourselves. We cannot better conclude than by giving a short review of the situation from Messrs. Dun, Wiman's Circular which says :

" Surveying from all general points of view the commercial condition of the country, it seems impossible to arrive at any other conclusion than that it is safe and prosperous. The losses by bad debts in the year which is now closing, bear but a meagre proportion to the profits realized in legitimate trade. The additions which have been made in the surplus of almost every prudent business man are larger than have ever been realized in any previous year, and that the increase of surplus is more the result of honest, legitimate profit than of any speculative success must be universally admitted."

TORONTO'S JEWELRY TRADE FOR 1881.

Probably amongst the whole range of business carried on in the City of Toronto, none has developed itself more, or been on the whole more fairly satisfactory than the Wholesale Jewelry trade.

This business, dealing as it does entirely in articles of luxury, may safely be taken as an almost infallible barometer of trade, it feels the pressure of hard times first, and is the last to recover its effects, and it may be pretty safely asserted that when this trade is prosperous, the country must be in a flourishing condition.

The increase in sales during 1881 has been more than fifty per cent. in advance of the previous year, while the losses from bad debts have been unusually small. As a rule retail dealers have met their obligations promptly, and renewals have been the exception rather than the rule.

The Jewelry business of Toronto has now attained large proportions, and it is no exaggeration to say, that this city is at present the centre of the Canadian trade.

The reasons for this large and rapid growth are not far to seek, and may be briefly summerized as follows; the natural situation of the city, lying as it does in the centre of the largest and wealthiest Province in the Dominion; its unrivalled means of communication with foreign markets and home consumers, consisting of seven lines of railroad spreading fan like over the entire Province, and water communication through the St. Lawrence and entire chain of lakes; and last but not least, the enterprise and integrity of her wholesale merchants, whose efforts have placed her in the van in this branch of trade.

Although the volume of business has been greatly increased during the past year, the margin of profit still remains very small, owing no doubt to the amount of competition amongst the wholesale houses themselves, and the great amount of smuggling carried on in this description of goods.

The wholesale trade are pretty well agreed that while the rise in duty would not affect them adversely if it could be collected, that under the present condition of things it is simply an incentive to smuggle, and puts the honest importer at a very considerable disadvantage as compared with his less scrupulous competitor.

Experience has proven conclusively, that it is next to an impossibility for any Government to successfully collect a high rate of duty on goods as expensive and small in bulk as Jewelry and Watches, and the trade generally consider that the Government should lower the rate considerably and give the honest importer a chance by placing him on the same footing as the smuggler.

The aggregate sales of the Wholesale and Manufacturing Jewelers of Toronto for the past year amounted to $759,000, of this amount $194,000 was manufactured in the city, the balance, $565,000 being imported goods of English, Swiss and American manufacture.

The amount of Watches, Clocks and Jewelry passed through the Port of Toronto during the past year was $340,015, being an increase in amount of $131,863 over the importation of the year previous. On these goods the importers paid duty to the amount of $83,643, or an average of twenty-five per cent., a rate altogether too high for this description of imports.

Although there are fourteen jobbing jewelry houses in Toronto, some of them are of very small proportions, the bulk of the business being done by the ten following houses: Zimmerman, McNaught & Co., John Segsworth & Co., Lee & Chillas, P. W. Ellis & Co., S. Stern, Carrier & Marshall, H. A. Nelson & Co., Smith & Fudger, S. Frenkel, and E. & A. Gunther.

In addition to these the following firms sell watch materials at wholesale, P. W. Ellis & Co., A. Kleiser, and T. S. Culp.

The manufacture of Jewelry, although a comparatively new industry in Toronto, has increased very rapidly during the past year, there being now not less than sixteen firms engaged in its various branches.

Some of these firms are very small, employing only from two to three hands, while the larger factories employ from ten to fifty workmen.

The total number of hands now engaged in this city in the manufacture of jewelry is 173, and their products aggregated in amount $194,173, or an average $1,130 per man employed.

In several lines the home manufactured goods have driven the imported article almost entirely out of the market, being not only cheaper, but better in quality and of a style more suited to the wants of this country. Amongst the goods manufactured here, which compete on favourable terms with the imported article, may be mentioned, gold chains of all kinds, wedding, keeper, gem and signet rings, lockets, cuff buttons, and watch cases in gold and silver.

The principal manufacturers are P. W. Ellis & Co., Zimmerman, McNaught & Co., Welsh & Trowern, Arms & Quigley, Hill & Houghton, W. C. Morrison, and White & Son—these seven firms employing 139 of the total of 173 engaged in the business.

The indications are that the manufacture of jewelry will be largely increased during the coming year, as several of the larger firms are making preparations to enlarge their premises and increase their output of manufactured goods.

In addition to this, Toronto is to have a first-class establishment for the manufacture of electro plated ware of all kinds, the first of its kind in Canada. The company which has been incorporated under the name of the "Toronto Silver-Plate Co.," is now putting up a handsome brick factory, and expects when fully running to employ from fifty to seventy-five hands. This will be an important addition to the manufactures of this city, and will add in no small degree to its importance as a wholesale market.

The following table shews the value of goods imported into the Port of Toronto during the past three years, and the duty collected during the past year:—

	Amount 1879.	Amount 1880.	Amount 1881.	Duty Collected 1881.
Clocks and parts thereof	$17,925	$27,897	$34,239	$11983.65
Electro-Plated Ware	41,413	44,022	83,191	24957.33
Jewelry	62,610	84,962	125,385	25077.00
Watches, Movements and Cases	41,962	44,305	88,768	19959.40
Manufactures of Gold & Silver	17,362	6,966	8,432	1666.65
	$181,272	$208,152	$340,015	$83,643.78

Selected Matter.

THE FIRST WATCH IN THE JURA MOUNTAINS.

A house trader from Chaux-de-Fonds in the Swiss Jura which at that time counted but few houses, brought from the interior country a watch home with him. These dwellers of these far-off regions very probably had never seen such a mechanism, but a young man lived there, who, besides the simple trade of his father, a blacksmith, had, from early childhood, evinced an unquenchable passion for all kinds of mechanism combinations requiring reflection. The watch got out of order, and was confided for repairs to this, at that time, fifteen-year old boy Daniel Jean Richard Bressel. He took it down, found the defect, and put it together again. He had meanwhile studied the entire mechanical arrangement, made a drawing of each part, and went to work to make a new one, for which purpose his inventive genius was forced to supply the lacking tools. Suffice it to say that in one and a half years he had manufactured the first watch in the Jura. When Bressel died at Locle in 1741, lurative business already had taken seat in this poor pastoral region, which, little by little, has become such an eminent source of wealth to the entire country.

"And when dying leave behind us
Footprints on the sands of time."

—*Jeweler's Circular.*

SURETY'S LIABILITY.

We had occasion, after the original trial of the case of Crathern *vs.* Bell, to refer to its peculiar circumstances. The matter has since been up for argument before the full Court of Queen's Bench, for Ontario, resulting in a decision in favor of the plaintiffs, Messrs. Crathern & Caverhill of Montreal. The facts may briefly stated as follows: The defendant Bell by written agreement guaranteed to the plaintiffs the payment by one of their customers, of two promissory notes in their favor of $751 each, with a limitation that he should not in any case be called upon to pay more than $751. In other words the defendant undertook up to amount of $751, to make good any loss which plaintiffs might sustain upon the notes in question.

On the maturity of the first note the debtor was unable to pay it in full and applied to Mr. Bell, his surety, for assistance. The latter thereupon gave his note for the requisite amount, which he discounted and applied the proceeds to the payment of the plaintiff's note at the bank for collection. The plaintiffs learned in due course of this payment but were not advised of the means whereby the funds were procured. Default was afterwards made on the second note, which the defendant was called upon to make good. Then, for the first time, it was communicated to the plaintiffs that the defendant had assisted in the payment of the first note. This was relied upon as discharging Mr. Bell, to the extent of that assistance, from his liability on his guarantee.

Under the circumstances it is held by the Court that there was no default in payment of the first note, and that the advance made by the surety to the debtor before any default had taken place was not a payment by the defendant in satisfaction of his liability to the plaintiffs. Accordingly the defendant is condemned to pay the full amount of the second note. The law is very strict in the rules required to be observed by creditors who seek to retain the liabilities of sureties. Still as this decision shows, a like good faith is necessary to be observed by sureties themselves. If they chose to make their arrangements with the debtor without the knowledge of their creditors in such a way that the creditors position may be effected injuriously, they may find themselves held to their original liability.—*Monetary Times.*

COLOR RELATIONS OF METALS.

In a paper on the color relations of copper, nickel, cobalt, iron, manganese, and chromium, lately read before the Chemical Society, Mr. T. Bayley records some remarkable relations between solutions of these metals. It appears that iron, cobalt and copper, form a natural color group, for, if solutions of their sulphates are mixed together in the proportions of twenty parts of copper, seven of iron and six of cobalt, the resulting liquid is free from color, but is gray and partially opaque. It follows from this that a mixture of any two of these elements is complementary to the third if the above proportions are maintained. Thus a solution of cabolt (pink) is complimentary to a mixture of iron and copper (bluish green); a solution of iron (yellow) to a mixture of copper and cobalt (violet); and a solution of copper (blue) to a mixture of iron and cobalt (red). But, as Mr. Bayley shows, a solution of copper is exactly complementary to the red reflection from copper, and a polished plate of this metal viewed through a solution of copper salt of a certain thickness is silver white. As a further consequence, it follows that a mixture of iron (7 parts) and cobalt (6 parts) is identical in color with a plate of copper. The resemblance is so striking that a silver or platinum vessel covered to the proper depth with such a solution is indistinguishable from copper.

There is a curious fact regarding nickel also worthy of attention: This metal forms solutions which can be exactly simulated by a mixture of iron and copper solutions; but this mixture contains more iron than that which is complementary to cobalt. Nickel solutions are almost complementary to colbalt solutions, but they transmit an excess of yellow light. Now the atomic weight of nickel is very nearly the mean of the atomic weight of iron and copper, but it is a little lower, that is, nearer to iron. There is thus a perfect analogy between the atomic weights and the color properties in this case. This analogy is even more general, for Mr. Bayley states that in the case of iron, cobalt, and copper, the mean wave length of the light absorbed is proportional to the atomic weight. The specific chromatic power increases with the affinity of the metal for oxygen. Chromium forms three kinds of salts, pink salts, identical in color with the cobalt salts; blue salts identical in color with copper salts; and green salts, complementary to the red salts.

Manganese, in like manner, forms more than one kind of salt. The red salts of manganese are identical in color with the cobalt salts and with the red chromium salts. The salts of chromium and manganese, according to the author, are with difficulty attainable in a state of purity. He thinks these properties of the metals lead up to some very interesting considerations.—*Chemical Review.*

A GREEN varnish for metalic objects, which is said not to lose color in the light, may be prepared by precipitating a solution of finely powdered sandarac of mastic in strong potash lye, after diluting it with water, by copper sulphate or copper acetate, and then dissolving the washed and dried green precipitate in oil of turpentine.

STEAMY WINDOWS.

Steamy windows have already begun their annual annoyance of the ironmonger. Yearly the question suggests itself. Can the nuisance be prevented or mitigated? So far as we have seen, no satisfactory cure has ever been suggested. In August, 1879, a patent was applied for but afterwards abandoned. The invention consisted in applying to the windows a varnish of methylated spirit containing 5 per cent. of glycerine and some essential oil. Whether it was found in practice that the application did not act as expected we do not know; but at least it could only serve as a poultice to a wound already made. What is the cause of steamy windows? The hackneyed answer that the cold outside condenses the moisture of the air is undoubtedly correct, but it does not explain how the moisture gets into the air. And as the air in the shop is warmer than that outside, its power of retaining water in a vaporous condition is very much increased, so that the watery vapor in the air of the shop must greatly exceed that of the external air, or no deposit of moisture would take place. It is certain that the greatest deposit of moisture takes place in warm, well-closed shops, and the idea that the warmth has something to do with the deposit is a very natural one. A walk along the streets in a winter evening shows that the amount of moisture on the windows varies very much in different shops. Some will be almost free from it, others are as opaque as if they were of ground glass. For some time we have been trying to find the reason for this, and although we cannot explain all the anomalies we meet with, yet we think some light can be thrown on the matter. The best-lighted and warmest shops seem to suffer most. Now, as warmth ought to decrease the deposit, provided the air could take up no more water as it got warmer, we must look for some means by which the proportion of watery vapor in the air is decreased with the temperature. This is at once found in the gas, which is almost universally used for lighting and very often for warming. For the amount of light given out gas produces very much more water than either oil or candles. If the ventilation be thorough enough to keep the air of the shop nearly at the same temperature and humiditly as that outside, no moistnre will be deposited on the window. But if the air is at all confined, as the assistants will certainly wish it to be, then as long as gas is burnt and the products of combustion allowed to escape into the air, so long will the windows be obscured by moisture. As gas is the great offender it is useless to provide air-tight windows, at enormous cost, if they be lighted with gas inside. We know a shop where some hundreds of pounds were spent in air-tight cases for the windows, where this mistake was made. Another source of moisture is the breath of the assistants and customers, and this seems to be sufficient to make it impossible to avoid all deposit on the windows. But if petroleum or electricity be used to light the shop, or if the products of the combustion of the gas be carefully removed, then the nuisance will be greatly mitigated. Some shops are lighted by "Sun" burners on the ceiling. The effect as regards illumination, is excellent, and this plan makes it very easy to remove the products of combustion. Of course if a gas-stove be used to warm the place, and the products allowed to escape into the shop, neither petroleum nor electricity will prevent steamy windows. Various contrivances—such as open gratings at the top of the windows, double sashes, &c. (as described in our issue of November 27, 1880)—have been tried but the measure of success achieved appears to have been irregular and often disappointing.—*The Ironmonger*.

TRICKS ON JEWELERS.

"Everybody knows Samper, whose big shop window, brilliant with gold and gems, attracts the attention of all strollers on the Rue de la Paix, and Samper knows everbody who is worth knowing, as he has furnished half the millionaires of Europe with their jewelry. It was a risky thing, then, for the stranger who tried to get the best of the clever lapidary. Nevertheless, there is no limit to brass, and said stranger, a young man of gentlemanly manners and appearance, alighted from a private carriage, with a coachman and flunky in faultless livery, entered the establishment, and, declining to speak with any one except the great Panjandum himself, stated his wish to buy a sapphire worth 32,000f. Samper had no such stone on hand but thought he might be able to find one in the course of a few days, would Monsieur come back? Monsieur said he would, and explained that he wanted it for a seal ring. "Is it not rather too good for such a purpose?" suggested the jeweler, who forthwith retired, crushed with mortification, when the other replied, " Nothing is too good for me." Samper was overwhelmed, and even opened the door himself for his customer, who returned in the same equipage four days afterward, saw the sapphire, condescended to be satisfied with it, and requested to be shown the handsomest ear-rings and lockets in diamonds which were in the collection. His choice was made promptly to the tune of 75,000f, after which he took out a check-book and signed an order on the Credit Lyonnais for the money in the name of Prince Strozzi " What name?" asked Samper. " Prince Stozzi." " Thief! " exclaimed the lapidary, and then the door was locked and the police sent for and in five minutes the stranger, ornamented with a pair of bracelets not set with brilliants, was on his way to the station, accompanied by an admiring crowd, and to the utter dismay of his coachman and of " Tumas " who remarked sadly: "Good God! they have collared master; in whom hereafter, can we put our trust?" The culprit is an old offender, and if he has now failed it was because he had tried it on in the same way last year with another notable jeweler—M. Boucheron, who lives close by, to whom he gave a check for 190,000f after a similar comedy. Boucheron suspected the fraud, but, wishing to take the swindler, said nothing, promised to carry the jewelry to the Grand Hotel—he pretended that it needed polishing—and sent to the Credit Lyonnais, where he found that "Prince Strozzi's account originally of 1,500f., was actually 50 cents. Naturally, the Chevalier d'Industrie did not return to ask questions concerning the non-delivery of his purchase, but a twelvemonth afterward, supposing the adventure forgotten, went for another victim in the same neighborhood, and was then redhanded. Denial being useless, he has made a clean breast of it, and told that his real name is Tamin, that he lives in a wretched lodging-house in Latin Quarter, and makes a precarious existence by nefarious expedients, these being baccarat at the Cercles in the evening, and theft by daylight. This capture is important, as it may lead to that of others of the swell mob with which Paris is infested, and whose exploits are not always failures, as in this

instance. Less lucky than his colleagues of the Rue de la Paix, another M. Roucheron, residing in the Palais Royal was plundered of a diamond broach worth 50,000f, exactly four and twenty hours before Tamin-Strozzi was arrested, under circumstances of singular audacity and it is not unlikely by the same individual.

People who visited the Exposition of 1878 remember the magnificent diamond set which was the grand prize of the National Lottery. On Friday, at 3 P. M., a number of persons came into the shop to look at some jewelry; the prize set was brought out, but the price not suiting, was put on on side while the customers inspected something less expensive.

Just then a young man, dressed as an Englishman and with a strong foreign accent, entered and asked for some diamond studs, taking his seat close to the counter where the big set was deposited. I ought to add that this consists of a diadem, a necklace, a broach—the most important piece—and a pair of ear-rings. The studs were too dear and too large, and the clerk was told to fetch something cheaper and more modest. The clerk went to the back shop to get some, first, however, taking the precaution to call in his fellow-employee, M. Leon, who was bidden to keep an eye on the visitor, who had dropped his umbrella three times in the most suspicious manner. M. Leon was vigilant. The stranger rose, walked about the shop very unconcernedly, gave his name as Lord Trelawney, approached the door, opened it, stepped outside, and has not been seen nor yet heard of since, any more than has the diamond breast-pin, which was prigged during the moment elapsing between the exit of one shopman and the ingress of the other. Evidently there is some connection between these two affairs, and the detectives are sanguine of being as successful as they were in the recovery of the necklace stolen a year ago by the Bulgarian Kahsch, whose accomplice was arrested a few months ago, on her return back from New York, where she had vainly endeavored to dispose of the property. There is a vast deal of this sort of thing going on now in Paris, and too much reason to suppose that people occupying perfectly unequivocal positions in society not infrequently consent to serve as receivers, and to aid in sales. To get something below its market value is a wonderful inducement to some persons, especially to foreigners, who, being generally on the wing, are less likely than natives to be met by the original owners.

I would not for one moment cast a doubt on the genuineness of origin of a certain immense emerald which its proprietor is trying to sell to the wife of an American millionaire for 70,000f. It is said to have been presented to an ancestor by a great Sultan two or three centuries ago; perhaps it was, and, as the gentleman who now offers it bears an unblemished reputation, I should think the story true.

But I cannot forget one incident in which a very high-born lady was very nearly ruined by a very simple act of complaisance towards one of her friends who was in money difficulties. The tale is perfectly authentic. It was told to me last night by one of the parties involved and for that reason I shall only give initials, which I need scarcely add, are not the real ones. Said the Countess de L. to the Marchiones de M: "I am requested to sell a lot of diamonds for the Queen of—; do you know any one in want of a splendid set; quite a bargian?" The Marchioness did; M. de N., was about to get married; it would be the very thing for a wedding present, and she would speak to him. So she did, and he took her advice, and quite by chance happened to meet an acquaintance, a celebrated lapidary from London, who consented to accompany her as an expert. The stones were produced, weighed and examined, and approved by M. de N., who, however, did not conclude their purchase at once, thanks to a sign from the Englishman. "I cannot understand your disapproval," he said, when they got into the street; "the diamonds are magnificent, they are dirt cheap, why should I not buy them?" "Simply" replied Mr. D., because they belong to me; a fortnight ago they were stolen from my rooms, and it is for their recovery I am in Paris now." No scandal was made about the affair, as the Countess is too well connected, and Mr. O. declined to ruin her family by a prosecution, being perfectly satisfied to get back his property, but, as the coachman of Tamin-Strozzi might have observed, is not this a warning against over-confidence.—*Paris Correspondent of the Jeweler's Circular.*

A GOOD process to restore burnt steel is to heat it to a bright cherry red and immerse it in water three or four times. Then forge carefully and the steel will be nearly as good as before.

BUSINESS CHANGES FOR JANUARY.

J. F. Austin, fancy goods, Peterboro, Ont., selling out; D. & L. McIntyre, hardware, Lucknow, Ont., selling out; E. Friedenburg, jeweler, Ottawa, left, sheriff in possession; J. R. Smith, jeweler, Wingham, Ont., advertising business for sale; Cameron & Westcott, hardware, Beaverton, Ont., damaged by fire; Crathern & Caverhill, wholesale hardware, Montreal, Mr. Caverhill dead; W. E. Jones, jeweler, Stratford, Ont., selling out; Edward Graver, hardware, Barrie, Ont., sold out to his son Robert Graver; A. H. Doran, jeweler, Emerson, Man., damaged by fire; George J. Beattie, hardware, Bracebridge, sold out to Alfred Hunt; T. J. Wetherall, jeweler, Port Colborne, Ont., burned out.

BUSINESS NOTES.

A BARB wire manufactory is about to be erected in Winnipeg by a Chicago firm.

THE employees of Messrs. Allcock, Laight & Westwood have presented Mr. A. R. Wightman with an address and handsome clock, on the occasion of his leaving the firm to start in business in Montreal. Mr. Wightman has been with the firm for twelve years, and has resided in Toronto for over thirty years.

EARLY on Sunday morning burglars entered Nathan G. St. Mary's drug store of Essex Centre and succeeded in blowing open an iron safe and extracting therfrom money and jewelry to the amount of $1,200. The burglars bored a hole in the top of the safe about the size of a pea, and evidently used nitro-glycerine to accomplish their purpose. The concussion blew out the whole of the front windows and sashes, and shook down many large bottels of drugs. The actual loss is estimated at $1,500.

ALFRED BURCH, the Pullman car smuggler, was sent to gaol for eight days, with the addition of a fine of $100, which is to be paid before he is liberated. Patterson for whom he was smuggling the watches, and who was found with a large quantity of the jewelry in his possession, was permitted by H. M. Customs officers to escape.

AN EXCHANGE says "Hagstoz & Thorpe have been awarded the gold medal at Atlanta Exposition, in the Boss filled case, it being the best filled case at the exhibition; the favor with which these cases have been received by the public is the best indication that the committee of award was fully capable of judging as to the merits of the several cases exhibited." We fully endorse this.

AT THE commercial travellers' dinner in Boston the other day, Mayor Green propounded in in his speech the conundrum:—"Why is a commercial traveller like a drummer? Because he has a level head to drum." This was very good, until some one suggested that drum-heads are made of sheepskin, and commercial travellers are not mutton-heads.

ADVICES from Scotland announce the death of Mr. Thomas Caverhill, a partner in the wholesale hardware firm of Crathern, & Caverhill Montreal, a director of the Exchange Bank, and a large stockholder in several other important corporations. Mr. Caverhill was one of Montreal's prominent financial men, and had gone home to Scotland several months ago for the benefit of his health.

MESSRS. LEE & CHILLAS, wholesale jewelers, of this city, have removed to their new and more attracive premises in the Royal Insurance Building, corner of Yonge and Wellington Sts. Their new

warchouse is elegantly fitted up and highly suitable for their special line of business, and we wish them continued success iu their merchantile career.

E. Freidenberg, an Ottawa jeweler, has been missing since New Year's eve,and it was feared that he had met with an accidental death. His family were very much troubled over it and have re ported the matter to the police, who are doing all in their power to clear up the mystery. Later de velopments indicate that Freidenberg has not suicided, merely " vamoosed the ranche." The Sheriff is now in possession of his estate.

Mr. Thos. H. Blundell died very suddenly last week of apoplexy. The deceased was well known as a jeweler doing business on King street Toronto. He was not feeling well in the morning and Dr. Britton, who was a particular friend, was sent for. Shortly after his arrival the deceased died. He was only married about four months. Mr. Blundell was highly regarded among the trade on accouut of his gentlemanly and obliging manners.

From an exchange we learn that Mr. W. T. Doll, jeweler, of Flesherton and Dundalk, has bought out the stock and business of Mr. E. D. Wilcox of Markdale, and intends in future to run the three stores. Such enterprise is commendable, and we trust will meet with the success it deserves. Our contemporary however winds up the notice by gravely assuring its readers that Mr. Doll will superintend the management of the three establishments in person; rather a difficult feat, we have always imagined for a persou in the body to accomplish, but we trust that Mr. Doll will succeed in the novel and enterprising endeavor.

It would be a step in the direction of the public convenience if the Postmaster-General would establish a dead letter office in Toronto. There should be three or four such offices in each pro vince, instead of all dead letters being sent to Ottawa. Much valuable time would be saved and a larger percentage of letters would reach their destination, as local clerks would have better opportunity of knowing addresses than clerks at Ottawa. If a letter is devoid of postage it is packed off to Ottawa, whereas common sense would suggest it being opened by a sworn official at Toronto, so that the mistake could be remedied right away. Branch dead letter offices in the chief cities of the Dominiom would about complete the circle of postal convenieuces.

Last month Mr Grose, one of the private dee tectives connected with the secret service of th Customs Department, visited the different ports in the Dominion, among them Montreal, Kingston, Belleville, Brockville, Hamilton, Windsor and Toronto. The detective visited this city on the 26th of December, and made butone seizures. This consisted of two gold watches and eleven lady's gold rings, the whole property, amounting to between $300 to $400, belonging to F. Crumpton, a jeweler, No. 83 King-street East. On calling upon the latter gentleman he stated that he purchased the goods from H. W. Patterson, of Boston, and the reason they were seized was that they were undoubtedly smuggled. Crumpton had not paid for the goods and therefore was not the loser. The value of the goods seized at the other ports could not be ascertained.

The cheekiest thing we have seen in the way of an advertisement for a long time is that of "Russells" the Watch Manufacturers of England and Watch Auctioneers ofCanada,in which after lauding the English Watchmakers they gravely inform the public that "these facts are well understood in England, but in Canada mere sellers of watches do not know auything of the merits of a watch mechanically, are prone to decry everything English in general and the Russell Watch in particular." Of course we do not for a moment assume that the watch dealers of Canada individually or collectively know one quarter as much about the mechanical construction of a watch as the writer of the above advertisement. One thing they must be credited with, viz: common sense, and in their judgment English Watches have been tried and found wanting. If the English Watch had the superlative qualities Mr. Cuthbert claims for it, it would not require to be hawked about the country and sold at public auction to the consumer. The American watch is perferred by dealers and the public, simply because it is the best value for the money, and not on account of any prejudice in the matter.

Says the *Hamilton Times* "It will be a matter of regret to his many friends to learn that Mr. James A. Watts, for so many years connected with the Meriden Britannia Company, is about to leave Hamilton to take up his residence in Toronto. He has decided to sever his relationship with the firm, with whom he has been connected for twenty years, and in company with several leading capitalists he will proceed at once with the erection and equipment of a factory for the manufacture of plated ware in Toronto. The capital stock of the new company is $100,000. Already a site has been secured on King street west, Toronto, and it is expected that the building will be erected by May next. Mr. Watts knows the Canadian trade so thoroughly, having been general agent of the Meriden Company for many years before the factory was established in Hamiltou, that he may fairly look for a share of the business to come to the new establishment, of which he will be managing director. While sorry to lose so highly esteemed a citizen, and not too well pleased to see a Toronto establishment organized to compete with one in Hamilton, it must be admitted that Mr. Watt has so conducted himself as to earn a God-speed wherever he goes and should he return to Hamilton to spend the "pile" he makes in Toronto he will be sure of a hearty welcome."

"Says the Ottawa correspondent of the Government organ in this city. It will be remembered that a few weeks ago jewelry to the value of $1,200 was seized in Montreal. It was the property of a dealer named Patterson, carrying on business in Boston. Mr. Falkiner, barrister, of Belleville, was retained by Patterson to look after his interests. Though this matter is anything but ended, sufficient is known to indicate that there is a gang of jewelry smugglers operating in Canada. Patterson on being himself detected agreed to give full information to the Minister of Customs, and as "earnest" money he deposited $1,000 to be forfeited in case he did not prove the correctness of his statement. Acting on the information thus received an officer of the department was sent to out to make enquiries and investigations. The result is more than surprising. Acting on the information received from Patterson, seizures have been made in Kingston, Belleville, Toronto, London, Guelph and other towns in the west. It looks as if there were a thoroughly organized gang at work, with accomplices and connections in all the chief towns in the west. Now that the matter has been opened up somebody will suffer, and the public may look out for some startling disclosures. The Minister of Customs is not the one to half do his work, and now that he has hold he will make things lively for the gang. Of course the assertions of Patterson are already well proven, or I should not have permission to send this statements. Patterson's books, which came into the hands of the Minister, furnish the chief clue. It is the old story of misery loving company. As he had gotten into the trap he wished to see all the other foxes deprived of their tails."

WORKSHOP NOTES.

Old denti t's tools and sewing machine needles are said to make the best drills for watchmakers' and jewelers' use.

A good solution for hardening and tempering steel is said to be a weak solutiou of borax and sal soda. The water should bo first boiled and then mixed with equal parts of soda and borax and allowed to cool.

Watch cases which have been in fire, if good, are quickly cleaned by being boiled in water, one-half pint, and twenty drops muriatic acid, which leaves the gold pale in color. To restore this, brush with a rather stiff brush and a thick batter of tripoli and oil, carefully, however, not to attack the ornamentation of the case. If silver, red-heat and boil the case until white, theu brush with sand.

Acid proof cement. Make a concentrated solution of silicate of soda, and form a paste with powdered glass. This simple mixture is said to be invaluable in the operations of the laboratory where a luting is required to resist the action of acid fumes.

The following alloy has been patented in France—Copper 720 parts; nickel 125 parts; bismuth 10 parts: zinc 90 parts; soft iron 28 parts; tin 20 parts. This is said to form a fusible, maleable metal, easily worked by a silversmith; it resists the oxiding influence of the air, and is capable of being soldered.

To gold plate small articles without a battery: Digest a small fragment of gold with about ten times its weight of mercury until it is dissolved, shake the amalgam together in a bottle, and after cleansing the articles coat them uniformly with the amalgam. Then expose them on an iron tray heated to low redness for a few minutes; the mercury volatilizes, leaving the gold attached as a thin coating to the article. The heating should be done in a stove, so that the poisonous mercurial fumes may pass up the chimney.

To blue gun locks: Gun locks and revolver barrels being usually made of steel, are rendered blue by simply being subjected to heat. The articles are first finely polished and then exposed to a uniform heat gradually applied. This is best done by immersing them in wood ashes or sand and carefully watching the effect of the heat. As soon as they acquire the right color they are to be taken out of the sand bath and plunged into oil. The temperature necessary to obtain the color is from 500° to 600° F., the last giving the darkest shade.

In forging steel be careful to first free your fire from sulphur. This can be done by spinkling a handful of salt on it; next be careful not to overheat the piece to be forged; very small objects are easily heated in the flame of a lamp. Charcoal makes the best fire for all kinds of small tools. Do not hammer with heavy blows after the steel has cooled. By tapping it lightly, however, until it becomes black, the closeness of grain is increased.

To temper steel on one edge. Red hot lead is an excellent thing in which to heat a long plate of steel that requires softening or tempering on one edge. The steel need only be heated at the part required, and if carefully handled there is little danger of the metal warping or springing. By giving sufficient time, thick portions may be heated equally with thin parts. The ends of wire springs that are to be bent or riveted may be softened for this purpose by this process, after the springs have been hardened or tempered.

Nothing is better for cleaning silver than the following: Boil one ounce of finely pulverized hartshorn in one quart of water. Leave the vessel on the fire and put all the silverware into it, as much as the water will accommodate; let it boil for a time, take it out, drip it over the vessel, and let it dry at the fire. Continue until every article has been treated thus. Next place clean linen cloths in the water and let them become saturated. When taken out and dried, use them for polishing the silver, (and they are at the same time excellent for cleaning brass—signs, door knobs, etc.), Rub the ware with the cloth and finish with soft leather.

An improvement in escapements for watches, etc., whereby a more uniform movement is obtained, has been patented by Mr. Edward Wensch, of Vienna, Austria. The invention consists in an anchor rod pivoted on the top plate of the works, and having its lower end T-shaped, with a tooth engaging with the escapement wheel at the ends of this T-shaped part, and the upper end of this rod provided with a fork surrounding an eccentric on the shaft of the balance wheel, above which eccentric there is a plate with a pin at the edge, which a spring presses against for imparting motion to the balance wheel. By these means the escapement wheel does not directly transmit the motive power of the clockwork to the balance, but the movement depends on the power of the above named spring, which always remains regular. For pendulum clocks the construction is slightly modified.

SCIENCE AND OTHER NOTES.

All over the civilized world myopia, or near-sightedness is becoming alarmingly prevalent. Much study of miserably printed books, especially in imperfectly lighted rooms, has had a great deal to do in inducing this serious misfortune. But that is not the sole cause. Too frequently it can be traced to a general lowering of the vitality of the patient, produced by competitive examinations, low diet, badly ventilated rooms, lack of genial society, etc. It goes without saying that the sight must be impaired when the body is weak. A society in Leipsic has lately tried the experiment of improving for a time the living and sanitary conditions of 131 children with the effect of increasing bodily strength and strengthening the sight. Some of the children were sent to the seaside and others to the country. At the end of six weeks the weight of each child was 1¼ kilogrammes more than it had been before, the chest was considerably expanded, and the sight was much better. This experience well deserves the attention of parents.

The *Japan Mail* states that the most skilful living bronze worker in the Empire is a Kiyoto artisan named Zoroku. His specialty is inlaying with silver and gold, which he carries to such perfection as to be scarcely distinguishable from the chefs de l'œuvre of the Min. period. He is a man of seventy—peering through a pair of huge horn spectacles at a tiny incense burner or still smaller flower vase, from whose frets and diapers he pares away an almost imperceptible roughness of excrescence. Beside him stands a brazier with a slow charcoal fire, over which an iron netting supports one or two bronze vessels similar to that he holds in his hand. These are being subjected to a slow process of baking; presently Zoroku dips a feather into a vessel filled with greenish liquor—acetate of copper—and touches the heated bronze here and there with delicate and dexterous care. This process, repeated about every two or three minutes, will be continued for half a year, after which a month's polishing will turn out a bronze so rich in green and russet tints that centuries seemingly would have been necessary to produce it.

The show of Mademoiselle Schneider's jewels and household furniture in Paris has been the great event of the gossiping world of fashion and dissipation. A crown of fine workmanship and studded with gems of rare value was included in the exhibition. This was the crown of the Grand Duchess of Gerolstein. A sceptre, also be-jeweled, kept it company. Rivers of diamonds were a drug at this suggestive exhibition. A necklace which was part of the Grand Ducal set, formed of forty-one pearls, six brilliants, and five sapphires, went for 68,000 francs. Two black pearls were knocked down for 38,000 francs, an emerald pendant went for 11,000 francs, and the diamond which formed the center of the stars of the Order of Brave Knights at Gerolstein, for 10,000 francs. The total proceeds of the first day's sale exceeded $43,000. It is Mademoiselle Schneider's intention to end her days in a convent. As her fortune is considerable, she is not obliged by harassing creditors to sell her jewels, which are of astonishing variety and richness.

VALUABLE JEWELERS'

SAFE

FOR SALE CHEAP!

As good as new, fitted up with all the latest improvements for keeping jewelry. 42 drawers with cupboard room 2 ft. x 4½ ft.; inside dimensions, 4½ ft. x 5 ft.; outside measurement, 6 ft. 3 in. x 9 ft. Steel inside doors.

Combination Lock on each outside Door. The finest Jewelers' Safe in Canada. For further particulars apply to

THE LARGEST

Clock House

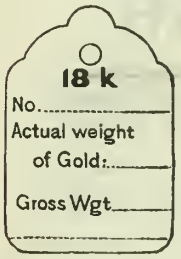
IN CANADA.

I beg to direct the attention of the Trade to my large assortment of Clocks, from the following celebrated manufacturers, viz:

SETH THOMAS, WELCH,
GILBERT, AND ANSONIA,
INGRAHAM.

I keep these Clocks in every style now manufactured, and show 200 different varieties of samples, besides Regulators of all kinds.

I will sell, only to the Trade, any of the above makes of American Clocks at prices lower than any house in Canada, and will guarantee to meet any competition either in quality, style or price. Also a large variety of Ladies and Gent's Swiss Watches, Gold, Silver and Nickel Cases, Key and Stem winders.



SAMUEL STERN,

Sole Agents for SETH THOMAS' CLOCKS,

3 Wellington, 40 Front St. E., Toronto.

WE BEG TO CALL THE ATTENTION OF THE TRADE to the well known quality and elegance of finish of our Gold Cases, guaranteed by us to be of eighteen karat Gold, U. S. Mint assay, or of fourteen karat Gold, as may be stamped, and also to our mode of selling the same, charging only for the ACTUAL WEIGHT *of the gold used, and not for the base metal comprised in springs, key pipes, filling of crown, etc. To illustrate which we here show copy of tag accompanying each one of our Gold Cases, which plainly indicates not only the gross weight of the Case, but also the* NET *weight of the gold.*

AMERICAN WATCH COMPANY,

ROBBINS & APPLETON,

New York, August 1st, 1881. General Agents.

IN EXPLANATION OF THE ABOVE we desire to say that the old plan of charging for the gross weight of the case, as if it were all gold, worked well enough as long as the manufacturers were content with the amount of brass and steel actually required in its construction; but when the business was degraded into a contest as to who should get the most base metal into the least quantity of gold and call it a GOLD case, then the time came when, in the interest of dealers in American Watches it became necessary to adopt a plan of selling, showing the buyer exactly how much GOLD each Case contained.

In adopting this method we act in conformity with the earnest wishes of the leading houses of the Trade, some of whom have already undertaken to carry out the same idea in their own business.

ROBBINS & APPETON,

Editorial.

NO INSOLVENT ACT.

It is now quite evident that the Government has no intention, this session at least, of bringing in a new Insolvent Act.

So far, the country has been in a highly prosperous condition, and the want of such an Act has not been seriously felt, but just as soon as a reaction sets in and we again feel the stringency of hard times it will be found that the present chaotic state of affairs will not answer.

At present the want of an Insolvent Act has a tendency to curtail credit amongst wholesale dealers, and in that way, it may not be altogether an unmixed evil, but while it has a tendency to make our wholesale merchants look more sharply after their customers, it also has the effect of curtailing our national credit abroad. We have before pointed out that the effect of the want of an Act compelling the fair division of a debtor's estate has impaired our credit in the English markets, for the simple reason that creditors so far away must always be at a great disadvantage as compared with creditors close at hand, especially when the law, or rather the want of it, allows the first come to be served in full no matter whether the others get anything or not.

We say that although this state of affairs cannot last long, the absence of an Insolvent Act may not be altogether an unmixed evil. If it makes dealers more careful in buying, and warns them that it is not so easy to get whitewashed as it formerly was under the old law, it will have served a good purpose, but sooner or later we think that Government will be compelled by public opinion to bring forward a thorough and comprehensive Insolvent Act that will put a stop at once and forever to the legal tricking and sharp practice that is now resorted to by debtor and creditors alike.

A MYSTERY.

Every one at all acquainted with trade knows that there is a great deal of smuggling carried on between the United States and Canada; that the smuggling exists solely on account of the high tariff imposed by the Government, and that it cannot be stopped unless the duties are lowered or entirely done away with. A very pertinent proof as to the extent to which this practice is carried on in American goods coming into Canada, may be found in a comparison between our statement of the goods we import from the States and their statement of the amount of goods they sell to us. Tabulated the figures stand thus :—

Canadian imports of American goods for the year ending 30th June, 1881—

American Export figures.....$39,512,876
Canadian Import " 36,704,112

Discrepancy, $2,808,764

There are three possible explanations of this discrepancy. (1.) That the Minister of Finance, for political effect, has discounted and thus reduced the amount of our American imports in order to show a favorable balance in support of the National Policy theory. (2.) That this discrepancy represents the difference between the actual price at which the goods were purchased and the price at which they were entered for duty; in other words, it shows how much dishonest importers have cheated the Government out of by means of false invoices. (3.) That this discrepancy represents the amount of goods smuggled into the country.

The first explanation we dismiss at once as being only offered for political effect and unworthy of Canadian statesmen.

As for the second, while it is certain that this discrepancy covers the amount of goods that are passed in by way of false invoices, yet we are glad to think that this custom is not general and that the amount is comparatively small. We are inclined to think that fully two millions of this discrepancy is caused by smuggling, and that the full amount is made up by the goods smuggled and the goods passed in by false invoices. After a careful investigation of the subject this is the only conclusion we can arrive at, and it goes to prove what we have already advanced, that on small and valuable goods the duty should be lowered so as to take away the incentive to smuggle.

If this principle were kept in view and acted upon by the Government, we are satisfied that smuggling would be much more rare than it now is, and that the amount of duty collected would be greater than at present.

ANOTHER WARNING.

In our October number we drew the attention of the trade in general, and the Jewelry trade in particular, to the folly of trusting valuables to the keeping of key-locking safes.

Our remarks at that time were inspired by the fact that only a few days previously, a Toronto jewelry firm had, from this very defect, been robbed of over $3,000 worth of goods, which, up to this time, have not been recovered or even traced. In the article in question we pointed out the weakness of key-locking safes and warned our readers not to put any faith in them, no matter how complicated and safe they may appear to the uninitiated.

We are glad to know that in some quarters our warning was productive of good and that the old key-locking safes were replaced by something more modern and reliable.

We are only sorry that our advice was not followed in all cases where such protection was in use. Had it been, the present article would probably never have been written, and the victims of the "gentlemanly burglar" would still have been in possession of much valuable property.

The robbery in question was that of Messrs. W. C. Fox & Co., jewelers, 129 King Street East, of this city, who, by reason of this very defect of their safes were robbed of over $3,000 worth of goods. As a full account of the robbery will be found in another column, we will simply say here, that the robbery would hardly have been attempted had the goods been protected by first-class safes.

The store had every other protection —lighted gas, private watchman, policemen passing continually, and even a family living overhead, but in spite of all these precautions, the burglars appear to have secured their booty not only without any difficulty, but without leaving

any trace whereby they may be detected, or the goods recovered. It seems that each of the proprietors carried keys of the safe, one to fit each lock, and that their keys were never out of their possession. Moreover, these keys were of such peculiar construction as to make their owners believe that their safes were absolutely burglar-proof.

This probably was the case, and had the burglars been compelled to force the safe open, it is more than probable that they would either never have made the attempt, or else have been detected before they could have completed the job.

The detectives, as usual, have nothing to advance but theories, but their theory seems, at all events, to be a sound one this time, although it will afford but little satisfaction to Messrs. Fox & Co. to know that the robbers probably visited their residence and secured and took wax impressions of their keys while they were asleep. We say that this is the most probable explanation of the remarkable ease with which they executed this robbery, for it was almost precisely in a similar manner that they obtained the keys of Messrs. Welsh & Trowern's safe for the September robbery.

It is quite evident, from this and various other robberies of a similar kind, that key-locking safes, however perfect their locks, are entirely worthless in the face of such an operation as detailed above, and the only safe way of keeping valuables is to secure the safes in which they are stored by combination locks.

Even these, as we have before pointed out, are not absolutely burglar-proof, but they at least do away with more than half the risk. The balance may be minimised by keeping the store well lighted up at night and an honest and vigilant watchman to look after it.

Good safes are now so cheap that any merchant who trusts to the old-fashioned ones on account of the expense is penny wise and pound foolish. The slight additional expense involved in procuring the modern improvements is more than compensated for by the increased protection secured and the peace of mind resulting from the knowledge that everything has been done that can be done to secure safety.

To any of our readers who have not yet discarded their key-locking safes we would say: don't trust to them any longer than it will take you to get a new and modern safe in their place.

The losses we have chronicled should be sufficient warning, and a word to the wise is sufficient.

ARE YOU INSURED?

Probably no subject, in these days of destructive conflagrations, is more important than that of adequate fire insurance, and we are sorry to say that in many cases it receives but a very small portion of the consideration due to its importance. While to the thoroughly trained business man, adequate fire insurance is a necessary adjunct of his business, to the untrained and unthinking, it is an unprofitable expenditure of money that is made more often at the solicitation of the insurance agent, than for any conviction of its practical necessity.

No greater error than this could be practiced by any business man, for facts which can scarcely be contradicted, furnish abundant evidence that fires will occur in spite of the greatest possible precautions to prevent them. This being the case, it becomes the imperative duty of every business man to guard against possible loss from this source by adequate insurance in some responsible company, and the refusal or neglect to provide against such a contingency is not unfrequently attended with serious loss to the creditors, and utter ruin to the merchant whose conduct has made such a thing possible.

Probably every one of us can call to mind instances of merchants who have been reduced from independence to poverty by their failure to comply with this very important business requirement; and the wonder is that with so many warnings before their eyes, there are any merchants to be found blind enough to stand in their own light and thus deliberately run the risk of commerical shipwreck.

We submit that this question of adequate fire insurance is one of the most important that can engage the attention of any business man, either wholesale or retail.

It is not enough to be insured, for a merchant may be that, and still in a position to be ruined by a general burn out. What is wanted, is for each merchant to have an insurance commensurate with the amount of stock he carries, so that in case of a sweeping fire, he will not be crippled, ruined entirely. So necessary has adequate fire insurance become that we find it has become a general custom among many of our largest and wealthiest wholesale merchants to increase their insurance day by day for short date policy during their season of large imports, deeming it too great a risk to allow their ordinary amount of insurance to stand against their increased stock, even though the danger be only for a few days or weeks at the most. If the wealthiest cannot afford to become their own underwriters, by running unnecessary risks, it stands to reason that to the average business man adequate insurance is a matter of vital importance, and should be delayed no longer than it takes to find out the amount of stock and get the policy properly executed.

A very important factor in the question of fire insurance, is the standing and reliability of the company insured in. Many people run away with the mistaken notion that any Insurance Company is good enough, and if they are insured at all they are safe enough. There never was a more absurd idea, and as a rule this class of insurers get into small Mutual Companies, with little capital, less responsibility and no dispotion to pay, and the result is that when loss by fire does occur they are unable to get a single dollar from the company, who will raise any and every possible legal quibble in order to get rid of paying the claim.

Competition in the insurance business is so keen that there is but little difference between the rates of reliable and irresponsible companies, and what little there is, is more than counterbalanced by the additional risk the insurer runs.

As a rule cheap insurance, means unsafe and risky insurance, and is dear at any price.

We cannot better conclude than by giving our readers the advice we gave them nearly three years ago, advice which we sincerely trust will be followed by any who have neglected this very important question.

Always keep your stock and property insured.

See that it is insured in some first class company that has a reputation for honorable dealing.

Read your policy carefully and see that you comply faithfully with its requirements.

If you insure in more than one company see that your policies are made concurrent, and not each company allowed to insure a particular kind or quantity of goods.

There being so very little difference between the rates of strong and weak insurance companies, it will pay you to have the best if it does cost you a trifle more; it is a great advantage to be in a company that is financially strong.

Selected Matter.

ODD TASTE IN JEWELRY.

"Here is something new in the way of ornamentation," a salesman in a large up-town jewelry store said, opening a box and exhibiting a monster beetle four inches in length. About its body was a solid gold band, locked by a tiny gold padlock, to which was attached a costly gold chain, about two inches in length, fastened to a pin. The beetle's back glistened in the light, having been treated to a dress of gold, and as it lumbered along its legs worked in a curious fashion. "It's a shawl pin. You see the pin is used to fasten lace or a shawl, or perhaps worn on the bonnet, the insect crawling around the length of the chain. They are perfectly harmless and not expensive, as they live on hair—that is, they have never been seen to eat. This one was brought here to mount, which is a very fine operation, as the legs and atennæ are all so delicate. After all, there is nothing objectional about them, except the idea of having them crawl over you. They all come from South America and the only lot now in the city is to be taken to France, where the owner will try to introduce the fashion of wearing them. They cost from ten to fifty dollars, depending entirely upon the mounting of the ring. There is nothing cruel about it, as they are bound loosely, and the gold has no effect upon their hard sides."

In Brazil the fashion of wearing beetles is carried to a great extent. A well known resident has a beetle with a collar of gold which meets at the top, and is there ornamented with a diamond of great value. The insect has a cage, surrounded by the plants among which it lives in its native state, and nothing is neglected to make it as comfortable as possible. But the most popular insect used for an ornament in Brazil is a small phosphorescent beetle. These are often worn fastened in the hair, and as the two phosphorescent or life-giving spots are on the sides of the head, the black insect is, of course, invisible when in the raven locks of the fair Brazilians. Twenty or thirty of these beetles will throw out a light sufficient to read by, and when arranged around the head in a circle or grouped over the forehead and held in place, the effect is beautiful.

Several years ago a New York lady gave a masquerade ball at her summer house in Newport. The dancing was on the lawn, and the guests were requested to be there half an hour before dark. The hostess wore the costume of night, and in daylight her black dress, covered with ivy leaves, did not attract special attention, but when she appeared in the gay throng after dark she presented a perfect blaze of light, and was the centre of the admiring and wondering company. Tremulous waves of reddish-yellow flame seemed to move over her entire dress while in a cap on her head gleamed one great fiery star. The cause of this illumination was the phosphorescent light of more than five thousand fire flies. For weeks previous to the ball the designer of the costume had been storing away fire flies, and on the day of the fete they were rapidly put on the dress. As the light-giving spot is on the ventral surface, each one was placed on its back held down by a fine silver wire, so skilfully caught that it could not turn over or escape, and was injured. The star was formed of many beetles.

In Jamaica a large beetle, the Lampyris, is used by ladies. Some of the phosphorescent beetles used by them give out lights that have to be seen to be appreciated, and more than twenty different kinds are used, representing as many different degrees of light, shade, tint, etc. One, the Pygolampis, has a rich orange color, changing to yellow, flickering in intermittent flashes of light; another, called Photuris, is curious for the gradual increase of light it shows; commencing with a faint reddish hue, it rapidly grows in brilliancy, finally blazing like a torch, a rich green light, and then dying away to reappear again. They attract other light-giving beetels, and frequently numbers of lesser lights are seen flitting around them, combining red and yellow lights of the greatest brilliancy. Other uses are made of these beautiful creatures than ornaments. Travelers have fastened them to their feet and carried baskets of wicker to light their way in the dark.

Snakes have been used as ornaments, the small inoffensive green snakes being the most popular, on account of their beauty and harmless nature. They coil around the arm, clinging on with all the tenacity of their golden jewelled imitators that are now so fashionable. Animals or parts of them, though naturally the adjuncts of barbaric splendor, are greatly used in the make-up of fashionable toilets of the present day. Some of the handsomest sleeve buttons and studs are made of polished fish skin—sharks or dog-skin being preferred, as they take a fine polish and closely resemble the fossil coral Favosites, that is also used, and when highly polished the delicate cells that were once the home of the coral polyp are distinctly visible, and as a whole resembles honeycomb.

An expensive costume was a cape made of an extremely rare humming bird. The whole bird was hardly larger than one's thumb and on its breast a single patch of gold was found about an inch in length. The cloak was composed wholly of these patches, and in the sunl ght must have vied with the golden fleece. The birds are valued at $50 each.

A lady in St. Augustine created a sensation by appearing in public with a chameleon resting on her headdress, and held there by a delicate silver chain. The little creature was perfectly tame and made no attempt to escape; but when touched by any other than its owner, its throat puffed up and curious waves of color passed over the whole body, ranging from deep green to dark brown. Small lizards are used in Egypt by some of the native ladies as ornaments, and lie half concealed in the drapery that overhangs the face. The red clawed soldier crabs are sometimes used in Mexico as pins. The crab is disloged from its stolen shell and given a beautiful pearly one, or one that has been plated with gold or silver. Fastened to the lace by a pin and chain, they make unique ornaments.—*Jeweler's Circular.*

ABRAHAM LOUSIS BREQUET.

[A BIOGRAPHICAL SKETCH BY D. N. IN *Allg. Uhrmach Ztg.*]

What a volume of incentive contemplation to the growing watchmaker is connected with the honored name of a man who, among the horologers of Europe up to our time, has been one of the greatest and most skilful masters.

Born in want in the year 1747, in Neuenburg, Switzerland, whither his father, who was a merchant, was forced to fly from France, for the sake of his religion, he showed even in earliest childhood a deep interest in horology, which stood in high repute in his native town. The parents decided to let him learn watchmaking, but the father died when the boy was barely eleven years old, leaving the widow and child in misery.

Misfortune, however, has often been

the incentive to genius; and so it was in this case. The mother, after a lapse of a year, married a watchmaker, who enjoyed universal esteem on account of his moral qualities, and the youth accepted with joy the invitation of his stepfather to become his apprentice. But the monotonous, sedentary pursuit, the regular and strictly inspected work of the workshop was little relished by him, and the actual progress made did not justify the high expectations entertained of him. In fact, he made no progress, and who knows if this great genius might not have disappeared altogether under existing circumstances, if his stepfather had not resolved to leave Neuenburg, and go to Paris. When the change was accomplished, he articled his stepson to a watchmaker in Varsailles, for further information, who was a very eminent master of the art, and who, as soon as he happily recognized the inherent qualities of the boy, began to develop and cultivate them, so much so that even after a short period in his workshop a complete change had taken place in him. Labors which had been once his detestation, became his pleasure, and manipulations, which with all possible endeavor, could not be mastered, were acquired in a short time without exertion. All his capabilities suddenly developed, instigated by the love and confidence which his master ever demonstrated for him, in a most surprising manner.

Within a few months after completing his apprenticeship of three years, he had the misfortune of loosing both his parents and the duty developed on him at so tender an age of providing for his younger sisters and brothers. And how diligently and untiring worked the young man. He bore with pleasure every privation to support them in honor.

Although an excellent workman, he felt himself deficient in astronomy and mathematics, without which he considered it impossible to arrive at a greater perfection in his art. He commenced a still greater degree of frugality and shunned the most trifling expenses for the purchase of pleasure, and this, united to an untiring diligence, soon enabled him to enroll himself in the class of Professor Morin, in the school of Mazaran in Paris.

But the unassuming and knowledge seeking young horologer did not remain hidden to the celebrated professor; he soon singled him out from among his scholars, not alone by the distinguished praise which he paid to the works of the young artisan, but also by the still greater honor of establishing personal relations with him. And nothing more decisively influenced Brequet's future great achievements both as horologer and as a mechanician than this intimate relation which sprung up between the great man of letters and the young watchmaker, who reconized in the study of theory the securest means of elevating himself beyond mediocrity in his calling.

After having worked for a number of years in the different workshops of Paris, he purchased, with his savings and the assistance of his friends, a small house in the vicinity of the hotel de ville, and commenced business on his own account. Although very excellent in his pursuit, he was far from enjoying a European fame.

His celebrity was mainly due to a watchmaker Arnold, in London, who with mere disinterestedness assisted him with all the means at his command. The French Revolution caused the young man to leave France for several years; he went to England, and engaged himself uninterruptedly with watches so extremely valuable for their assistance to mathematical sciences.

When the internal affairs became settled, he returned to Paris, and his endeavors not alone brought him fame, but also, what happened more seldom—wealth. He was appointed horologer of the marine, and finally was accepted as member of the Royal Academy of Science—an honor which is so rarely bestowed. Henceforward, his fame spread. Besides his astronomical clocks, which are diffused in the observatories of all parts of the world, he manufactured artistic clocks and watches, adorned with the most splendid ornaments and cases for the kings and potentates of Europe. A large colection of clocks and watches of all kinds made by him, is preserved in the Tuileries in Paris, and Versailles.

In the workshop, Brequet was solemn and silent, a pattern, in every respect, for his workman, but in social intercourse he was genial and amiable, and was much sought for and respected in all the upper circles of society.

He corresponded with the greatest mathematicians and philosophers of the age; no scientific man of eminence ever left Paris without having paid him a visit.

But the man ever remained single, frugal and unassuming in his surroundings; the small cottage in which he founded his business remained for fifty years his home and workshop. He departed in the full enjoyment of his fame, in the year 1823, highly honored by his colleagues, and deeply mourned by all those whom he had in the most manifold branches of industrial pursuits, assisted both by deed and counsel.

A DIAMOND TESTER.

A correspondent tells of an amusing incident that occurred on a train that was crossing the Rocky Mountains: A traveling peddler undertook in the cars to sell a large "diamond" ring to a miner, who had his pile.

"Hump," said the miner, after critically examining the ring, "they've got common stone up in the diggins where I've been that'll cut that diamond all to pieces!"

"If you'll find a piece of stone that will cut diamond I'll give it to you," replied the peddler.

All right," said the miner, "if I can't cut that diamond with a stone I'll buy it of you."

Thereupon the miner took the ring in his hand and pulled from his vest pocket a small piece of brown-looking stone, similar to a bit of dark free stone, except the grain was very fine, and with this he proceeded coolly to cut and scratch the "diamond" with several ugly-looking gashes. A group of passengers that had gathered about the miner was amazed, but, while they smiled the peddler with his "diamond" withdrew discomfited.

"That little piece of brown stone," explained the miner, "is a piece of corundum that I got in the Rocky Mountains, and its the best diamond tester in the world. It won't scar a genuine diamond but it will everlastingly cut up pieces of glass or quartz."—*Exchange.*

THE SANCY DIAMOND.

The art of diamond-cutting is usually supposed to have been invented by Louis van Berquem, of Bruges, in 1456; but closer enquiry shows that he only introduced important improvements into a method already in use. It is said that there were diamond-polishers at Nuremberg in 1378 ,and the same trade was exercised early in the following century in Paris, where a cross-way called "La Courarie," once inhabited by the work-

men, still exists among the diminishing relics of the past. Nor is it to be supposed that this art was entirely unknown to more ancient nations. In India, from the earliest times, a mode of releasing the crystal from its native husk was employed, which probably differed less in principle than in application from that now used in London and Amsterdam. The gem-engravers of antiquity not only worked extensively with the diamond-point, but in some cases engraved the "indomitable" stone itself In the Duke of Bedford's collection, for instance, is a diamond engraved with the head of Posidonius, and one bearing a portrait of a Roman emperor was to be seen at the Paris Exhibition, 1878. It is questionable that Berquem first introduced the method of cutting diamonds into regular factes, and employed for the purpose the wheel, with the powder of the gem itself, precisely after the modern fashion. In 1475, he made his first experiment of the "perfect cut" on three rough stones sent him by Charles the Bold, who was famed for his magnifience in jewels. all three were worn by the unfortunate Duke of Burgundy, probably with some regard to safety as to splendor, in his disastrous battles with the Swiss, but the talismanic value had gone out of them, so they were lost with the fortune of their owner, and after many singular adventures, found their way each to the treasury of a separate foreign potentate. The most celebrated of these was the "Sancy" diamond, a fine stone of 53½ carats. It was picked up on the field of Nancy by a Swiss soldier, who sold it for a florin to a priest; unsuspiciously redisposed of by him for a scarcely larger sum, and transported by the currents of chance of trade to Portugal, where it figured in 1489, among the crown-jewels of the unlucky Don Antonio. This monarch in difficulties first pledged, and then sold it for 100,000 livres io Harlay de Sancy, a French nobleman, whose descendant, Nicolas de Sancy, was induced to place the gem in pawn for relief of a pressing exigency of the crown in the time of Henri III. For this purpose it was entrusted to a servant to be carried to a jeweler at Metz; but neither servant nor jewel reached their destination, and the conclusion seemed inevitable that the temptation had proved too strong for the man's fidelity. DeSancy alone never wavered in in his reliance on the devotion of his dependent, and maintained that only with his life would he have separated with the precious charge committed to him. And in fact, after some further search had been made, the murdered body of the messenger was found by the roadside. It was opened, and the diamond was discovered in the stomach! Thus, by a last and despairing expedient of fidelity, this nameless hero baffled his foes at the very instant of seccumbing to them, and left to posterity the memory of an action brighter than the gem whose safety it secured. Through some unknown channel the "Sancy" diamond came into the possession of James II. of England shared his exile, and was disposed of by him "for a consideration" to his royal host. The "well-beloved" Loui wore it in the *agrafe* of his hat at his cornation, and it rested qsietly in the treasury at the Tuileries until the troubles of of the Revolution once more set it in circulation it found its way to Spain, was sold by Godoy to Prince Demidoff, and purchased from him by Sir Jamsetjee Jejeebhoy for the sum of 200,000 florins. And here or the present its story ends —*Frasers' Magazine.*

THE LARGEST CLOCK IN THE WORLD

The great and largest clock in the world was contracted for in the year of our Lord 1847, and started running in 1859, and started striking in July of the same year, although the construction was nearly completed in 1854 by the first Mr. Dent, a big name among watch and clock makers at the present day. The architect was Sir Edmund Beckett Dennison, who as a designer in horology, has ably proved himself on the top perch.

The clock in its general design is of that kind known as the platform kind, and its plates measure 16 feet over all; the ends are built into the wall, while the bracing resembles the trussing of our bridges. There are three trains of wheels: the time train in centre; hour strike train on the left; quarter train on the right. The main wheels are 40 inches in diameter, while the cam lifters for hammer tails are 38 in diameter. There is only one cam lifter on main hour wheel, with 10 cams and 3½ inch faces of steel. In this connection the above strength is necessary on account of the weight of the hammer to be raised, (420 lbs.) to strike the great 15-ton bell. The quarter chime hammers are much lighter being in portion to the bells to be struck by them. There are four, and they weigh rom three tons 18 cwt, down to one ton and one cwt. The diameter of hoop wheel is 30 inches, and the flys are in the usual proportion, but as the flys are driven with one pair of wheels to throw them on end and reduce friction, the flys proper resemble a large sized barn door, and the way they make the wind blow is awful. I will now describe the time train. The main wheel is 28 inches diameter, while the barrel is 16 inches, with a capacity for two feet of line. Great wheel has 180 teeth; centre 120; third 120; with pinions of 12, 16 and 9. This brings me down to the escapement, which is the far-famed-one—the gravity. This one is called the three-legged, and is formed of two wheels with three teeth each on same arbor, with space between, and in this space comes the lifting pallets, which are driven by the weight, and as soon as the pendulum swings against the lifted pallet it is released, thus allowing the pallet or arm to propel the pendulum on its opposite passage, where the same action takes place and a corresponding impulse is given. This escapement takes away all imperfection of trains, as the weight of pallet arm alone gives impulse. This clock beats two seconds; length of pendulum 13 064·1000 feet from suspension to line; of oscillation; weight of ball 685 lbs.; length of suspension spring 5 inches, 3 inches wide and 1-60 of an inch thick; glass used in dials, 2¼ tons, and with iron cost £5,334. Going part takes 20 minutes to wind; depth of well for weights 174 feet; clock frame 4 feet seven inches wide; dials 22½ feet diameter; weight of minute hand 2 cwt.; length 14 feet; the pendulum rod is compensating, with an appliance for regulating. The cost of this clock, in addition to dials and hands as above noted, was a little under £3,400, making the clock when finished cost the sum of £8,734. The writer of this will never forget the beautiful sounds of the bells which the clock gives out when striking. The large bell is heard ten miles off, and the small ones four to five. This clock is reported giving an error of only 90 seconds per annum; but the appliance for regulating by making it faster or slower as our city observatory does, debars us from forming an idea what it might be if left alone for one year.— W. A. Hendrie, in the *Watchmaker and Metal-worker.*

BUSINESS CHANGES FOR FEBRUARY.

Daniel Kennedy, jeweler, Springfield, Ont., has sold out; Gordon & Scott, hardware, Wingham, Ont., advertising business for sale; Robert Mitchell, hardware and tins, Chatsworth, Ont., leaving for Manitoba; Robert Sewell, stoves, &c., Toronto, assigned in trust; W. E. Dawson & Co., hardware, Charlottetown, P.E.I., business in future to be carried on by W. E. Dawson under old style; Evans, & Co, hardware, Collingwood, Ont., about dissolving; W. Perret, jeweler, Orangeville, Ont., removed to Manitoba; Rourke & Son, hardware, Charlottetown, P.E.I., dissolved; Allen & Borrowman, hardware, Amherstburg, Ont., have dissolved, Allen continues; J. Johnston, jeweler, Kingston, dead; C. & J. Allen, jewelers, Toronto, opening branch at Winnipeg.

BUSINESS NOTES.

Mr. J. Johnson, the well known jeweler of Kingston, is dead. The business will be carried on by his son in future.

The government have decided to do away with bill stamps in future. A sensible move we think, so probably will most of our readers.

C. & J. Allen the well known jewelry firm of King St., Toronto, have established a branch of their business in Winnipeg, Mr. Joseph Allen being the manager.

The jewelry trade of Toronto will soon be well represented in Winnipeg if things go on at the present rate. Mr. Charles Robinson, of the Sheffield House and Mr. Roberts, of the Rossin House, having taken up stocks for the purpose of opening out business there.

Mr. E. Beeton, a young and energetic watch maker has bought out the trade watch repairing business of the late Mr. Blundell. Mr. Beeton is a thorough mechanic, and we have no hesitation in recommmending him to the trade as perfectly trustworthy in every way.

W. C. Middleton, stationer, etc., of Arnprior, has assigned in trust. Liabilities, $7,600; surplus, $1,600. The cause of his difficulties in having too many irons in the fire—four stores, of which he was the proprietor, more than he could manage with success.

We notice that Messrs. Zimmerman, McNaught & Co., are about in a few days to remove to their new premises, 16 & 18 Wellington Street East, north side. Their new warehouse when finished will be probably one the finest in the city, and the firm and their customers will no doubt profit by the exchange.

We have to acknowledge with thanks the receipt of the *American Artizan*, a paper published in Chicago George Daniels. It is elegantely printed on heavy toned paper, and its reading matter is at once interesting and instructive. It should be taken by every one in the house furnishing trade who wants to know what is going on ontside. We shall be glad to have the *Artizan* on our exchange list.

Robert Sewell, a Yonge Street stove dealer, in this city, has failed for the second time. His first failure was while a partner of Whitehead in 1875 Their liabilities which were compromised at 50 per cent. were then $39,000. After this the firm was dissolved and he continued with apparently poor success, although about a couple of years ago he claimed to have a surplus of $6,000. Now his liabilities are $6,000. Outside creditors need not expect a dividend.

There are so many suspicious reports being circulated at present about the late robbery of Messrs. Fox & Co. of this city, that we think it well that the gentlemen in question should clear them up. It is said that not only did the obbers take all their jewelry and customer's watches, but that they had sufficient knowledge of the trade and business to tear out and destroy the leaves of the watch repairing book kept by the firm. This is very unusual for ordinary burglars to do, for as a rule they are in too much of a hurry to get off to care about such trifles as watch repair records. We understand that the firm are also asking a compromise from their Creditors on account of the robbery. The affair looks suspicious to say the least, and the Creditors should demand and have a satisfactory explanation before they decide to grant this favor Although these suspicions circumstances are gravely talked about, we think that ordinary fair play should prevent any one making any charges out of them until they have something substantial to go upon. The gentlemen in question should have the benefit of the doubt and be held innocent until they are proven guilty.

One of the most extensive and at the same time mysterious robberies that has taken place in the city for years was prepetrated on Sunday night of last week at the store of Messrs. Fox & Co., 129 King St. East, the estimated loss to the proprietors of the store entered and their customers being over $3,000. The proprietors of the place, Mr. Fox and Mr. M. H. Saunders, have not very extensive premises, but had a fine stock. Their store is almost immediately opposite St. James' Cathedral, and over it a family reside. Every night the gas is left burning in the store, and in addition to this a policeman and a night watchman regularly pass the place. On Saturday night both partners left the store as usual. after seeing that the stock of jewelry had been placed in cases in the safe, both doors of which were carefully locked. On Sunday Mr. Fox called at the store and took out with him a dog which had been left on the premises. At half-past nine o'clock, Mr. Saunders visited the store and found everything right. About three o'clock the lady who lives over the store was startled by hearing a dull sound below and thinking there might be thieves about the premises got up and slammed the door to frighten them. She then listened and hearing no further noise fell asleep. In the morning about eight o'clock one of the clerks, James Murphy, arrived at the store and as soon as he had opened the door saw that a robbery had been committed, and a very extensive one too. Watch and jewelry cases were thrown about in the most reckless manner, cheap goods were carelessly scattered about the floor, and the walls were depleted of the stock. Shortly afterwards both members of the firm arrived, and at once engaged in making up an exact list of their losses which are estimated as follows :—

50 silver watches	$750
14 gold watches	560
14 jewelry sets	275
60 gold rings	180
40 gold lockets	200
6 Albert gold chains	40
Cash	300
Customers' watches, chains, rings, etc.,	1,000
Total	$3,305

As said before a paid private watchman and a policeman were continually passing and re-passing the store, the gas was always left lighted at night, a family lived on the flat over the store and the doors and safe were always kept locked. When the clerk arrived he found the front door locked, both doors of the safe ajar and a back door open. As another back door was locked and bolted it is evident the robbers got in from th front which is kept fastened by a slight spring catch. Each of the proprietors has keys for the safe, one to fit each lock, and these they say have never been out of their possession. The instrument they used to assist the keys, and without which the doors could not be opened, was found lying on the floor. The detectives can at present form no idea as to who the thieves are or how the robbery could possibly be accomplished without having keys, as the locks could not be picked and they were not injured in the slightest. Perhaps the robbers may have visited the residence of the firm, and securing their keys got wax impressions of them, after which keys could easily be made.

We received a few days ago from a jeweler out west a trade circular emiuating from the now celebrated (?) house of H. W. Patterson & Co. of Boston, U. S. A., better known to many of our readers as the hero of the late Custom's jewelry seizures in Montreal. In this circular Mr. Patterson characterizes his arrest and the seizure of his goods, as "*my late difficulty with the Custom's authorities*," a modest way to say the least of putting a crime punishable by imprisonment. He also says "that he has had his attention called to many exaggerated and untruthful statements which have been published regarding his late difficulty" and that "several of his competitors are making capital out of those erroneous statements by trying to convince his friends (?) and customers that he will not again appear in Canada for the purpose of selling goods.

Before going further, we would say that we very much doubt that any of Mr. Patterson's competitors ever took the trouble to make capital out of the reports in circulation about Mr. P's "late difficulty with the Custom's authorities," as most of them consider that Mr. Patterson has pretty well "cooked his own goose" without any outside interference.

Mr. Patterson further goes on to say "I feel confident that your own good judgment will show you the falsity of the former statements and the thinness of the latter;" quite a judicious mixture we must say of soft soap and Yankee cheek. This is altogether too thin Mr. Patterson, the idea of your posing before your friends and customers and the jewelry trade of Canada in general as the victim of jealous competitors is too, too thin altogether. No, no Mr. Patterson you are hardly the kind of material they make martyrs of, on the contrary the custom in Canada is to make quite a different kind of example of persons caught breaking the laws of the country.

What is the Purpose of a Watch Case.

Is it an Article of Ornament? Is it a piece of Jewelry? Or is it made to protect the Movement, the most delicate instrument of precision in daily and general use?

While we do not lose sight of the ornamental features the article should possess (to which the elegance of style and finish of our cases does attest), we maintain that it is of PRIME IMPORTANCE to so construct it that it shall absolutely exclude all dust and rust, which, as all Watchmakers well know, are the great enemies of fine timekeeping.

We beg to call attention to the following letter from a member of the profession in Georgia, which is only one of a great many from all parts of the country, highly appreciating the Patent Dust-Proof Cases of our manufacture.

Letter from B. W. BENTLEY Valdosta, Georgia.

"I can say that I sold one of your Patent Dust-Proof Cases about ten months ago, and the other day it came back to me with the request to make it wind easier. On examination I found that the Stem was rusty, and I enquired into the cause of it. The gentleman stated to me that he was starting off some saw logs that had lodged in the bend of the river, and his chain caught in a bush and threw his watch into about 12 feet of water, and he was about two hours finding it. When he got it out it was running, and he thought all right. In about three months he found that the Stem was hard to turn, and sent it to me.

"I can say that the Watch is all that the Company claims for it, and recommend it to all Railroad and Mill men."

Extract from a letter written by C. S. RAYMOND, Clinton, Iowa, April 29, 1881.

"I wish you would send me a spring for the Wm. Ellery Watch. * * * By the way, this Ellery is a watch I sold to a farmer, in your Screw Bezel Case, last Fall. The first of January he lost the watch in the woods, and found it in about one foot of water. It had lain three months and over in snow and water, with but a slight injury to the watch—only a hair spring."

The above, as will be seen, were very severe tests, and demonstrate that, for a reasonable length of time, during which a watch might be under water, it would receive no injury whatever.

We wish to call attention to the fact, that although we do **NOT** *guarantee such cases to be absolutely water tight, many of them are, and nearly all of them can be made so with a little care and attention to details, such as thoroughly cementing the glass, &c.*

As a Perfectly DUST-PROOF Stem-Winding Watch Case we challenge the World to Produce its Equal.

AMERICAN WATCH CO.,

WALTHAM, MASS.

ROBBINS & APPLETON, General Agents,

NEW YORK. BOSTON. CHICAGO.

We have already taken up more time and space than we had intended in touching upon such a subject, but we cannot conclude without saying that Mr. Patterson need be under no misapprehension that the the Wholesale Jewelers of Canada are in anyway afraid of his competition. If he pays his duties his rivalry is not to be feared, and if he smuggles in his goods as before he will soon find himself in the clutches of the law, so that in either case the trade need not take the shakes over the prospects before them. Mr. Patterson cannot buy his goods any better, if as well as regular Canadian Wholesale Merchants in good credit, and therefore he has no advantage over them in any way. It was only when his goods were brought in by the underground railway that he was able to offer any wonderful inducements. This being the case we would advise the trade to stick to their regular legitimate Canadian Houses who do business upon old fashioned but honest principles, for by so doing they will save themselves the annoyance of Custom House investigations and perhaps the seizure of their goods.

WORKSHOP NOTES.

To clean gilt metal surfaces, dissolve 30 grains borax in 1 kilog water, and gently rub the article witb it; rinse with clean water, and dry with a soft linen rag.

Larger springs, which are exposed to breaking, are best annealed by rubbing them with tallow and letting it burn off over a gentle fire. Springs thus exposed do not break so easily, and are very elastic.

Cold silver wash—The articles intended to be silvered, of brass, copper or iron, are well cleansed. Iron must be dipped for a moment in a very diluted solution of sulphate of copper, and then rinsed; whereby it receives a thin copper, coating to which the silvering adheres. Then prepare the following powder: 3 parts dry chloride of silver are pulverized together with 3 parts of cooking salt, 2 parts prepared chalk, and 6 parts potash, Take a small quantity of this powder, dampen it with a few drops of water, and take some of this paste on cork and rub the clean metallic surface with it, until silvered.

Burnishing a brass wheel.—When the wheel has been riveted upon the pinion, turn a groove around both, lay the wheel upon a flat cork and grind out the strokes and marks with a blue waterstone, take care not to touch either pinion or wheel. Finish by giving it a fine smoothing, again laying the wheel upon a cork, and grind with a three-cornered file and fine water stone and oil. Then clean it carefully with a soft brush and warm soap water, and polish with a well-cleaned burnisher. Before doing this, lay a few thicknesses of silk paper upon the cork and burnish it with short strokes and with easy pressure.

A mechanic who is always in a hurry is incapable of doing good, honest work. The excitable man, who is always "flying around," and whose tools are never at hand when wanted, does not amount to much; he may be busy all day, and apparently—in fact, does work hard, and seems to get over a great deal of ground, but what he does do is neither fine nor substantial. The cool, calm workman, who allows himself neither to be driven nor persuaded to do more than a solid day's work, is the man who leaves his impress on each piece of work he turns out, and years hence it may be found as good and as solid as the day he completed it; but where will be the work that was thrown together at the same date by the man who was always "flying around?" Don't hurry your work too much.

Says a writer in a German periodical for goldsmiths: The art of counterfeiting silver has at present arrived at such a state of perfection that the silversmith, when buying broken pieces, should take great pains to examine each carefully. Especially is this true with regard to the present German silver. The color of this is always somewhat yellowish grey, and never as clear and white as 13 part silver. Its appearance upon the touchstone is a little reddish, playing into a steel grey. The surest proof is the test upon the touchstone, with pure nitric acid. If of German silver, the stroke will evanesce within a few seconds, without leaving a trace, while silver appears like milk-white lime, pure acid must be used. One kind of this acid destroys the proof of the silver, and this might accidentally be deemed a counterfeit.

SCIENCE AND OTHER NOTES.

English steel castings are made by some firms from old files in connection with other material, and are said to be sound and and very strong. It is said that the excess of carbon in the stock is found no disadvantage.

The Life of A Sovereign.—The average life of an English gold sovereign is about 18 years, that is, the coin loses three-quarters of a grain in weight in about that length of time. It then ceases to be legal tender. It is said that of the $100,000,000 of British gold coinage, 40 per cent is worn down below the legal weight.

New inventions in Watchmaking.—A veteran watchmaker at Vouvry, Switzerland, claims to have invented a process by which watches will run for years without winding up. A sealed box containing two watches intrusted to the municipal authorities on the 19th of January, 1879, has just been opened and the watches found going.

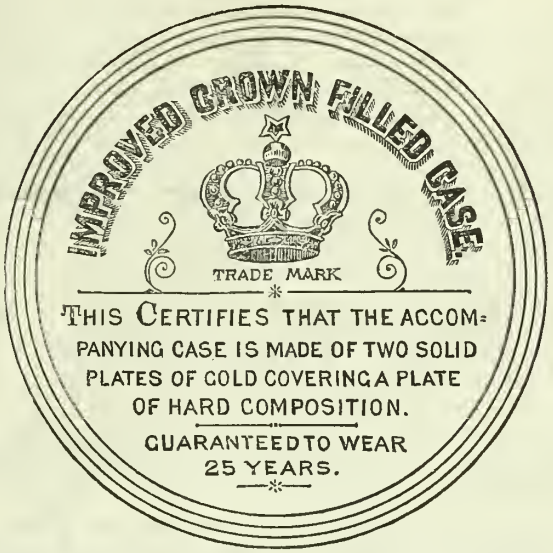
The Number of the metals.—According to Professor Ordway, the number of metals now known is seventy-seven. Within five years fourteen new ones were recognized: but none of them "have such novelty of character as to require the remoulding of chemical hand books." The names of many of them simply serve "to burden our memories with symbols of things remote from daily life."

An Irishman once saw a clock which showed the Greenwich and Dublin time, and he saw that the Dublin time was twenty minutes behind that of Greenwich. He asked how that was, and it was explained to him that Dublin being to the west of the first meridian, must have its time later than that of Greenwich. "Then be the powers!" says Pat, "there is another injustice to ould Ireland."

The New York Court of Appeals has decided that a watch is not jewelry. It is not carried or used as a jewel or ornament, but as a timepiece or chronometer, an article of ordinary wear by most travelers of every class, and of daily and hourly use by all. It is useful and neccessary to the guest in his room as out of it, in the night as the day-time. It is carried for use and convenience, and not for ornament.

The difference in time between New York and London is a curious feature in ocean telegraphy. The London banker is in the full swell of traffic when the New York agent is first thinking of "getting up." At noon the London markets are cabled to this city, where they arrive at seven o'clock in the morning of the same day. The London agent of the New York press telegraphs the most important news issued in the London *Times* at six o' clock in the morning. It is received at one o'clock in the morning, just in time to be inserted in the New York journals, whose readers have the same matter that the Londoner digests with his breakfast.

A reporter of the Fort Wayne (Ind.) *Gazette* who is an amateur electrician, tried an experiment the other day in telephoning which was of a novel character. Proceeding to the top of the building, he disconnected a wire, and holding the severed ends one in each hand, allowed the current to pass directly through him, he completing the circuit. The parties at the telephones talked through him without the slightest difficulty, and the reporter experienced no inconvenience from the current. Conceding the success of the experiment, it is not easy to see what practical use can be made of it, as there are very few reporters who would be pleased with an assignment to the tops of buildings as telephone conductors, at least until the *Gazette* man has so far perfected his discovery that the reporter can understand what is going through him. Such a man would be invaluable for any newspaper, and might pick up a good deal of intresting news, not attainable in any other way.



In no trade has machinery more thoroughly displaced hand-labour than furniture-making. One would think that the limit of human ingenuity in this direction has been reached. But an English inventor has made another step possible by contriving a process for inlaying by machinery. A veneer of light-coloured wood is glued over dark, or *vice versa*. On top of this is placed a thin zinc plate, in which is perforated the design to be inlaid. The whole is now steamed and made to pass between two powerful cast-iron rollers. The zinc is by this means crushed into the veneer and the latter into the solid wood beneath. The zinc sheet peels away ready, and all that has to be done is to plane the surface and polish. The work done by this process is singularly perfect, the joints being finer than any that could possibly be made by hand. Henceforth inlaid work in whatever design will be within the reach of short purses.

From data received at the Mint Bureau, the director, in his annual report just issued, estimated the production of the United States during the last fiscal year to have been, of gold, $36,500,000 and of silver, at its coining value, $42,100,000,—total of $78,600,000, The inquiries heretofore in regard to the annual consumption of gold and silver in the arts and manufactures have been continued, and with gratfying results. Manufactures of jewelry and other articles and materials of gold and silver reported a consumption of over $10,000,000 in gold and nearly $3,500,000

INSTRUCTION GIVEN.

The Watchmaker, Jeweller and Silversmith,

A Monthly Illustrated Journal. Published in London.

The Representative Organ of the Watch, Jewellery and Kindred Trades in the United Kingdom.

It is full of original information and thorough practical instruction contributed by the leading writers on the various subjects connected with the above trades. The text is well illustrated by wood-cuts, and two supplements of artistic designs for jewellery, etc. accompany each number.

This important Trade Organ, now in its seventh year of publication is in the hands of every British Watchmaker, Jeweller and Silversmith, and is therefore a most valuable medium for manufacturers requiring publicity in Great Britain.

Our list of permanent contributors includes such names as: J. U. Poole, Richard Whittaker, Henry Ganney, Moritz Grassmann, J. Herrmann, E. J. Watherston, W. H. Singer, an ample guarantee for the sterling value of the journal. Subscription 5s. per annum.

Published by A. FISCHER, 11 Saint Bride Street London, E. C., England.

T. WHITE & SON,

Manufacturing Jewellers, Gold and Silver Platers, and

LAPIDARIES,

N. B.—Always on hand a stock of

Stones, Imitations, Locket Glasses, &c

Unsurpassed in the Dominion.

in silver. Of the gold used, $2,300,000 was reported as United States coin melted. The Assay Office at New York delivered to the manufacturers during the year $5,700,000 of gold in bars, and $5,100,000 in silver. Taken together they appear to indicate a consumption of at least $11,000,000 in gold and $6,000,000 in silver, which would probably have been confirmed had all manufactures that were addressed promptly responded.

Said to be Three Centuries Old.—Mr. G. W. Stimpson, of Old Mackinac, brought into our office, recently, a relic that is a curious combination of wrought silver consisting of five pieces—two seals lone watch key, one ring, and a clasp that at one time must have enclosed a watch-guard. One of the seals was in comparatively good shape, and showed the original design very plainly, and in quite plain figures the date 1563 appeared to the naked eye, or 318 years ago. On the ring which connects the different pieces together, is the device of a dagger and the letter "M," thus indicating that it might at one time possibly have been possessed by Father Marquette who founded the first mission at Old Mackinac, over two hundred years ago. It was found by a gentleman looking for relics inside the old fort grounds there, and from him it was purchased by F. J. Stimpson. Our jewelers think that it is of French make. If it was not once owned by Father Marquette, doubtless it must have belonged to some of the early French settlers. Still, it might have been buried by some of the inhabitants of the fort before the massacre of 1763. Quite a number of intresting relics of bygone ages have been found there recently, including a silver bracelet, now in possession of J. D. McDonald, a large silver cross by Mrs. G. W. Stimpson, and about nine yards of beads by one of Mr. Stimpson's younger sons, and several finger-rings and other curious trinkets.—*Cheboygan (Mich.) Tribune.*

A valuable plastic material has been introduced in Germany for ornamental and other purposes. Five parts of sifted whiting are mixed with a solution of one part of glue, and, on these two being well worked up into a paste, a proportionate quanity of Venetian turpentine is added, in order to prevent brittleness; a small amount of linseed oil is also put with the mixture to obviate its clinging to the hands, and the mass may be colored by kneading in any color that may be desired. The substance thus formed may be pressed into shapes and used for the production of bas-reliefs and other figures, and may be likewise worked by hand into models—the hands to be rubbed with linseed oil, and the mass to be kept warm during the process. On becoming cool and dry, which takes place in a few hours, it is as hard as stone.

The coral fishing industry is one of the points at issue between France and Italy with regard to the ownership of Tunis. The Italians have monopolized this branch of commerce owing to the Imperial Convention of 1862, which reduced the tax (annual) for Italian coral fishers from 800 to 400 francs. The larger sum is, however, exacted from French fishers, who obtained the right by treaty of the same date. The first Tunisian coral fishers were, we are told, natives of Marsailles, who, as early as 1604, formed a company to work coral. Cutting and polishing manufactories have existed in Marsailles before 1807, for at that date as many as seventeen were found, and many hundred hands were employed in them. Coral has, however, of late years, lost favor in France. In Russia the fashion, however, of wearing it has increased, also in the Levant and elsewhere, the Italians supplying these markets, and it is this monopoly that the Algerians and Marseillais wish to break up.

In China an artistic painter gets little more wages than a carpenter, and the best of the fine decorators of porcelain, China, etc., are satisfied if they lay by enough during their lives to buy a coffin. Gold and silversmiths do a little better. The average pay of the skilled laborer is probably $3 a week for a master, $1.50 for a workman, and 50 cents for young people and females. The master lives generally at his workshop, having $20 to $30 worth of household goods. He pays $72 a year for food, $36 for rent and sundries, $12 for clothing, and is rich with $36 left. On the farm everybody must work, the children beginning at six years. From two and a half acres of and a well-to-do farmer will make $500 a year clear. The farm laborer gets 10 to 15 cents a day besides his food, estimated at 10 cents a day about $2 a year will clothe him, and he does well if he saves $4 a year.

On the 3rd of October, at the Paris Electrical Exhibition, a gentleman was leaning over a balustrade to examine an extremely interesting machine of M. Christofle, when his gold chain made a connection between two conducting wires which happened to be exposed. His chain became red hot and set fire to his waistcoat. To-day I had some conversation with a gentleman who was nearly killed the other day by a Brush dynamo-electric machine. Part of the conducting wire was not insulated, and was lying on the floor; he touched the stand of a lamp which formed part of the conducting system; his body then formed a connection through the ground to the naked wire, and contracted his muscles so as to cause his hand to clinch the lamp. Ten lamps were in circuit at the time, and so much current was passed through him that eight of them were extinguished. He was powerless to unclasp his hand. Every muscle in his body was paralyzed. His face was distorted; his lungs were so acted upon that he could scarcely breathe. He could only utter a faint unnatural cry. The workman in the place fled from the workshop, believing that some explosion was about to happen. A friend came up and tried to unlock his hand. This broke the circuit and his hands were released, while burning sparks flew to his hands in the action of breaking of the circuit. He was insensible, but has since then greatly recovered, and has devised an improvement to the lamp that will prevent a recurrence of such an accident.

In Sheffield, England, on the 3d inst., the spectacle was shown to visitors, of rolling a huge steel-faced plate for a government war steamer now building. The process, known as the Ellias patent, was satisfactorily completed in a quarter of an hour. The weight of the plate was 30 tons 16 cwt., and the length 10 feet 4¼ inches; breadth, 8 feet 9 inches; and thickness, 19 inches. Afterwards the visitors witnessed the flanging of marine boiler ends by hydraulic pressure in one operation A patent recently granted in Vienna and Berlin uses bands of steel, which is tempered and hardened, to transmit motion from one pulley to the other, the faces of the pulleys being turned perfectly flat and then faced with a varnish of rosin, shellac and asphalt.

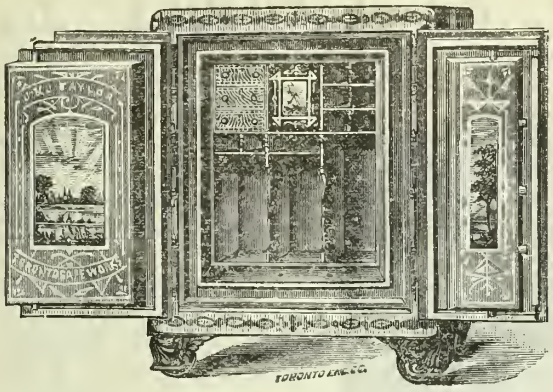
THE LARGEST

Clock House

IN CANADA.

I beg to direct the attention of the Trade to my large assortment of Clocks, from the following celebrated manufacturers, viz:

SETH THOMAS, WELCH,
GILBERT, AND ANSONIA,
INGRAHAM.



I keep these Clocks in every style now manufactured, and show 200 different varieties of samples, besides Regulators of all kinds.

I will sell, only to the Trade, any of the above makes of American Clocks at prices lower than any house in Canada, and will guarantee to meet any competition either in quality, style or price. Also a large variety of Ladies and Gent's Swiss Watches, Gold, Silver and Nickel Cases, Key and Stem winders.

SAMUEL STERN,

Sole Agents for SETH THOMAS' CLOCKS,

31 Wellington, 40 Front st. E., Toronto.

Editorial.

EXTRADITION.

We have several times pointed out the great advantage it would be for Canada to have an extradition treaty with the United States, comprehensive enough to embrace every offence punishable by imprisonment, excepting of course political offences. It seems however that Canada being only a Colony cannot of her own will, make such a treaty, and that it is problematical whether such an arrangement would be ratified by the home Government. We think most of our readers will agree with us in saying that the sooner we give the British Government a chance to confirm or disannul such a treaty the better for us. Situated as Canada and the United States are, with nearly three thousand miles of an imaginary division only between them, it is the easiest thing in the world for a criminal in our country to skip out into the other and thus evade the just punishment of the laws of his own country. As the very case with which they can thus evade arrest, in many cases forms an incentive of the strongest kind to persons whose moral nature is not sufficiently strong to keep them from breaking the law, it follows as a matter of course that if this legal "country of refuge" were to refuse to harbor them they would think twice before committing themselves.

In the present state of affairs Canada has very much the worst of the bargain, we give the United States the criminal offscourings of four millions of people, while we receive in return the criminal refuges of forty millions. In other words, if the proportion of crime keeps pace with the population, we receive *ten* criminals from the United States for every *one* we send them.

Mr. Blake put the case in a nutshell when he said, in speaking of the extradition laws that exist between Canada and other countries, that if the proposals made by Canada to the mother country in regard to extradition were not to be agreed to, Parliament might proceed legislatively in order that if we are unable to obtain from other countries the rascals that fly from us to them, we may at least return to other countries the rascals that fly from them to us. There is no reason in the world why Canada should harbour fugitives from justice other than political offenders. If the Act passed by the Canadian Parliament in regard to the extradition of criminals be prevented from going into force by the Imperial authorities it will be quite in order for the Canadian Parliament to enact that every fugitive offender shall be delivered up when a warrant is presented for his arrest, under the seal of the governor of the State from which he fled. In local matters of this kind there can be no good ground for England refusing to allow Acts of the Canadian Parliament to go into effect. The list of offences for which persons may be extradited should be made as large as possible. It might well embrace all offences for which the law provides penalties by imprisonment, and offenders should be just as liable to arrest on one side of the imaginary boundary line as on the other. If the extradition treaty between Canada and the United States is not to be allowed to go into force by the Imperial authorities, we can at least get rid of half the evil by delivering up fugitive offenders who take refuge within our borders, whether we get our own criminals back or not.

JEWELRY TARIFF CHANGES.

We have had occasion several times of late to express our views upon the absurdity of the high rate of duty at present levied upon the fine gold jewelry imported into this country, and we only recur to the subject again in order to show the absurdity of the late changes in the tariff made by the Finance Minister, and the undoubted necessity for a genuine reform in the way of collecting duties from this branch of our imports.

To anyone at all conversant with the jewelry trade it is apparent that the practice of smuggling is very materially increased since a higher rate of duty has been levied, for the simple reason that smuggling pays better than it formerly did. We believe we are safe in saying that more than twice as many goods are smuggled into Canada to-day as was smuggled a few years ago when the duty was only fifteen per cent. This fact is well known by every manufacturer and wholesale dealer in the country, from the simple reason that they meet the competition of these contraband goods at every turn, and this competition is the most formidable one they have to encounter. If this duty could be collected we would be the last to cry out against it, for we are quite willing to see our manufacturers get the full benefit of this protection to its utmost extent, being fully convinced from experience that internal competition will keep the prices down to a proper figure. But this duty, as everybody knows, is not always collected, and thus while its abnormally high rate is a direct incentive to the smuggler, it acts as a clog to the honest wholesale importer, without materially benefitting the manufacturer.

We have before enunciated the principle that goods such as jewelry and watches, which are valuable and small of bulk, should be taxed as lightly as possible, and that any loss of revenue from this source should be made up by an increased rate upon the more bulky and less valuable goods, which are so difficult to smuggle, as to put all importers on an equality as regards their lay down cost. We have all along contended that if this principle were put into practice by the Government, the revenue would suffer but little, if any depletion, while the manufacturer and honest importer would be very much benefitted, the former by having a certain though small amount of protection; the latter by being placed on an equality with the smugglers who seem for the past few years to have been the especial pets of our Government, so tenderly have their interests been catered for.

The present Government cannot plead ignorance of the wishes of the bulk of the Canadian trade as regards this matter of a reduced rate on jewelry. They have had the matter brought to their attention in almost every conceivable shape during the past two years, and for that length of time they have been giving it their usual "serious consideration."

No doubt the matter has weighed

seriously on the Finance Minister's heart, and has more than once engaged the attention of the Cabinet, and had the benefit of its united wisdom. The result of all this thought, inquiry and deliberation has at length been given to the world, and the mountain, after a protracted and painful labour, has at length brought forth its mouse. In other words, the Minister of Finance has, in his recent masterly and convincing speech, made public the decision of the Government upon the desirability of a change of tariff upon articles of jewelry imported into this country. The changes are neither so radical nor sweeping as to occupy much space, and may be briefly summarized as follows: "Duty on clock springs reduced from 35 to ten per cent.," only this, and nothing more. Well, absurd as it is, we, like dutiful children, must accept it with a thankful spirit; it is at least the thin end of the "reduction policy" wedge, and we do not for a moment suppose that it will rest there. But, thankful as we are for small mercies, we cannot help inquiring, how on earth the Government came to the conclusion that the panacea for all the present ills of the jewelry trade lay in the reduction of the duty on clock springs. We are aware that the duty on clock springs is perhaps a very important consideration to the only clock factory we can boast of, but we cannot for the life of us see why the Government in their wisdom should have stopped at clock springs. Why did they not include watch springs, which are as much raw material to every watchmaker in the country as the clock springs are to the factory above mentioned. Clock springs are never smuggled that we know of, whether they come in as part of a finished clock, or separately as material they paid the same duty of thirty-five per cent., and this being the case, we cannot see how the clock factory was at any disadvantage regarding this part of their imports. A more absurd bungle in the way of tariff reform we never heard of, and the only wonder is that the Minister of Finance had the courage to present this orphaned bantling to the trade without some suitable companion to bear it company. Perhaps the powers that be thought that if they reduced the duty on watch and clock springs at the same time, the shock might prove fatal to the trade, therefore it was deemed wise to give them tariff reform in homeopathic doses.

But joking aside, we think we can safely say that while none of the trade will quarrel with the reduction of duty on this single article, it will not satisfy their just demands for *real reduction*, and, as we have before pointed out, the present duty is not only no protection, but a positive detriment to honest trade by placing a premium upon dishonesty in the shape of smuggling. Houses which are loyal enough to their consciences and the Government of the country, to pay the duty demanded by law, are placed at a serious disadvantage when forced to compete against unscrupulous dealers who, having no fear of the consequences, refuse to "render unto Cæsar the things which are Cæsar's," and import their goods by way of the "underground railroad." The Government cannot plead ignorance of this competition, damaging alike to morality and trade, for the recent developments—such as the Patterson and other seizures—must have convinced them that this dishonest practice was no myth but a stern reality. We have all along stated that while we believe in protection, if it can be carried out, we are opposed to so called protection where it not only cannot be enforced but becomes from its very nature an incentive for the perpetration of the crime it was intended to prevent. The present Government and all former Governments, have recognized the principle we are contending for in the case of diamonds and other precious stones unset. These are admitted free of duty for the simple reason that they are so valuable and they are so small in bulk that it would be impossible to collect the duty were it to be levied. This being recognized in the case of the unset gem, why cannot the Government see that the same principle should govern the importation of the same gem if set with a solid gold mounting. True its value and bulk are slightly increased, but not so much so as to make it materially harder to smuggle, and thus give one kind of importer an undue and decided advantage over another in the struggle for trade.

We have not the slightest doubt but that time will show that this proposed change of tariff is an absolute necessity, and we very much mistake the temper of the trade if they are not found helping to put in men who will give them justice in this respect, if the present incumbents of office do not. As far as the encouragement of trade is concerned, the policy of the present Government has worked favorably, and they deserve well of their country for it, but it is far from being perfect, and they, themselves, will probably 'ere long not only acknowledge but remedy the defect we have endeavored to point out.

RAILWAY MONOPOLY.

With the exception of the boom in Manitoba, perhaps nothing is attracting more attention at present than the question of Railway monopoly. Hitherto Canadians have known about railway monopoly only as an historical fact, but of its selfish, grasping tendencies they have had no personal experience. This state of Acadian simplicity, however, seems destined to have a sudden termination, and if we can read the signs of the times correctly, our people will, unless they offer a very determined resistance, be subjected to a railway monopoly more grinding than has ever preyed upon the commerce of the country to the south of us. It is not very comforting to the people of Canada to know that after having spent millions of dollars in subsidizing independent railways for the purpose of creating competition, they should find their money worse than squandered because the rival routes were being acquired or controlled by some gigantic monopoly. But such seems to be the case, and almost every week brings news of some new development in this scheme of commercial piracy. The Bill now before Parliament to create a Railway Commission which shall have power to regulate freight rates and do such other things as may be necessary to protect the public against the insatiable greed of these corporations is a good one, and no time should be lost in giving it effect. Such a body, if properly selected and organized, could do the country infinite service, and aid very materially in developing its commercial capabilities. The first duty of such a Commission should be to do away with the unjust discriminating freight rates that have so long disgraced the management of such lines as our "Grand Trunk," and substituting therefor a regular equalized rate, based upon the cost per mile for carrying such freight. Thus every town would enjoy the advantage of its geographical position, and would not, as in some cases they are now compelled to do, pay a double rate in order that other places less favorably situated may reap the ad-

vantage. The Commission should not only put a stop to this unjust practice of discrimination, but should compel railroads to base the freight rates upon the cost of transportation, and not as at present upon what it will bear.

The present rate charged for passenger traffic should also be reorganized and a maximum rate of two cents per mile for first-class passengers substituted for the present three cent arrangement. As we have several times before pointed out, the present passenger rate is a most exorbitant one, and its reduction is a necessity of the near future, and we are strongly of the opinion that not only the public but the railways themselves will be benefitted by the change.

Public opinion is now beginning to be aroused upon this subject, and it is only a question of time when the principles underlying the creation of a Railway Commission will be carried into effect.

In England where such a body has been practically tried, it has been found to work so satisfactorily that the people seem to favor larger powers being granted the Commission than they formerly possessed. The abuses they were called on to reform (so like what we are at present laboring under) were so great that last year a Parliamentary Commission was appointed to investigate the complaints against the Railway Companies.

From the report of the committee, summarized by the London *Times*, which we give below, it will be readily seen that railway monopolists are the same all the world over, and that it is only by a determined effort on the part of the public that their rights will be respected by these powerful corporations. The summary of the report is as follows:—

1. That railway companies charge the public higher rates for the carriage of goods upon their railways than they are authorized to charge.

2. That the classification of goods in railway Acts is misleading and ridiculous, and that as a consequence traders are, as a fact, improperly charged when you compare one trade with another; and that they have the greatest difficulty in discovering in any case whether they are properly charged or not.

3. That certain places and districts are preferred in the matter of rates, or "nursed" by railway companies to the prejudice of other places or districts not so favored.

4. That the rates charged by railway companies for goods to be exported from, or which have been imported into this country are lower than the rates for similar goods passing over the same railways from and to home markets, and that the home producer is seriously prejudiced by this action on the part of railway companies.

5. That railway companies do not give traders and towns the advantage of their geographical position, but by lowering the rates for persons and places less favorably situated relatively to the market they introduce a competition which, but for such low rates, would not exist.

6. That railway companies do not regulate their charges by a consideration of the cost of carriage of the goods, but by considerations of what the traffic "will bear," and that, consequently, they charge one trader high rates, that they may charge another low, and so carry the trade of the latter at the expense of the former.

7. That the means of remedying these and other grievances is not efficient. The traders dare not seek legal remedies against railway companies, and that, consequently it would be expedient to give Associations of Traders and Chambers of Commerce a *locus standi* before the Railway Commissioners.

THE REMEDIES

for these grievances the Commissioners cannot settle upon without further consideration and further testimony. But they have arrived at the following definite conclusion in their report:— They consider it necessary permanently to maintain some special tribunal to which shall be referred questions arising as to the rights and duties of railway companies in their relations to trade and traffic; and security shall be taken that the proceedure of such tribunal shall be simple, cheap and expeditious. This tribunal shall have jurisdiction to enforce the provision of the special Acts of the several railway companies, and should be empowered to give redress in anycase of alleged illegal charges. A *locus standi* before it should be given to Chambers of Commerce and Agriculture, and similar associations of traders and agriculturists. A revised classification of goods and merchandise ought to be adopted by the railway companies as between themselves and the public, such as under the name of the Clearing House Classification, is already in use as between themselves. Railway companies should be bound to make no increase in any rate or rates without giving at least one month's public notice in the locality. This is about all. The permanent special tribunal seems to incorporate the American idea of State Boards, though much larger powers are conferred upon them. It is needless to dwell upon the probable working of such a measure, however, seeing that as yet it is a simple recommendation from a parliamentary body which seems to be, if not helplessly floundering in deep water, at least sorely puzzled to know just how to find its way out.

Selected Matter.

THE COMPENSATION PENDULUM.

The compensation pendulum is to the astronomical clock exactly what the compensation balance is to the chronometer, and whatever facilitates the narrowing of the margin borders the central line of absolute accuracy, reduces the space demanded by final adjustment. It may never become possible to produce, by mechanical means, either a balance or a pendulum absolutely correct, and requiring no further adjustment. There are means of closely approximating to that condition, and these I propose to impart.

In the first place, the conditions of the manufacture of Graham's mercurial pendulum, the adopted both of the art and of the astronomer, require careful consideration. The rod and the stirrup should, after all mechanical work is completed, be annealed down to the simplest softness, and all subsequent bending avoided, as well as any large amount of friction for the sake of polish; and no part of the stirrup should be left on a train, but should fit without shake, but still without bind. Here we arrive at the point where the closest approximation to the proportion nearest mechanically achievable—perfect compensation for temperature. The ordinary glass jar and mercury, being the simplest, is amongst, if not absolutely, the best; and the result of a great number of experiments has proved that a glass jar of exactly two inches internal diameter, containing eleven pounds eight ounces (avoirdupois) of mercury, will be so near to absolute compensation as seldom to require any correction when tested in heat and cold. The mercury should be carefully relieved from all admixture of atmospheric air, and this is by no means an easy task. In addition to the careful removing of any visible air-bubbles, time and the application of heat should be given, in order to facilitate the decomposition of such remaining portions of air as cling with great tenacity to mercury that has been recently shaken. For this purpose a piece of bladder neatly tied over the top of the jar will enable the maker to aid this decomposition by keeping the jar for a week or so in a temperature of (say) from a hundred to a hundred and five, and the jar should not be put into the stirrup until the manipu-

lations of the clock and its pendulum suspension are completed.

During the evening of the pendulum the addition or subtraction of mercury from the jar should be effected by a dipping tube. The most convenient form of this latter tool is a piece of glass tube, half an inch in diameter, drawn out at one end for a couple of inches to a nose about two inches long, and about a quarter of an inch in diameter. The top end of the dipper should also be drawn out a little, and the end of the drawn out part rounded where the orifice is about one-tenth of an inch in diameter. The plane in which the pendulum swings should be east and west, and the suspension should always be of such a form as will enable the pendulum by its own weight bringing the suspension of itself from all restraint of friction.

The fulfilment of the foregoing conditions will give in all cases good practi cal results.—*English Horological Journal.*

AMBIGUOUS ORDERS.

You can do a great service to your subscribers by occasionally calling attention to the subject of this communication. One of the vexatious things connected with our business is the annoyance caused by want of definiteness in giving orders for goods and materials, occasioned in part by deficiency of standard guages, and by not giving measurements by such guages as are in use, and often for lack of consideration. Particularly does this happen when the persons ordering are not familiar with the technic of the business. Many have taken up the occupation of watchmaker and jeweler without having been "brought up to it," consequently they have only a general knowledge of it and cannot know the technical name for everything pertaining to it. Such persons are liable to order from a material dealer "a little spindle that the tick wheel plays onto," and he might receive in answer to such an order either a cylinder, verge, or duplex balance staff. An order for "two dozen mainsprings, assorted," is definite enough, but yet has a vagueness that is puzzling to the dealer; for two dozen would only contain about one of each width, with no assortment for strength. How, then, can we fill such an uncertain order? Only by guessing at the wishes of the customer by what is known of him and his business.

Orders ambiguous and absurd are of daily occurrence, such as "a few glass to fit open-faced nickel watches," "hands for an American stem-winder," "a dozen hole jewels, assorted;" "send a hair-spring for a very small cylinder watch," "a mainspring for an old-fashioned verge watch," "a dozen glass to fit a five-ounce case," "a winding wheel for an Elgin watch." These and kindred absurd orders are made doubly annoying by the fact that the jobber is expected to know exactly what the customer wishes, and if the order is filled by an article he does not wish, the blame is attributed, not to ambiguity in the order, but to the stupidity of the seller, and an angry answer is often returned with the undesired article, and possibly a transfer of patronage to a rival establishment.

The thoroughly educated mechanic will probably ask why such ignorant pretenders are permitted to call themselves watchmakers, and why they are allowed in the ranks of legitimate tradesmen who have spent years in learning their art. We don't know; we only know there are thousands of naturally good, honest, ingenious men who are groping about in the dark, trying to follow a path in life that would have been all sunshine and success if they could have been started on it properly in the beginning—who, even in the dim light in which they labor, do more honest, honorable work than some others who, with the advantages of tools and competent instruction, make their trade and its mysteries a cloak to cover all sorts of petty cheats and swindles. How to give encouragement and instruction to the former class, and to suppress and eliminate the latter, are as yet two unsolved problems. That both are felt to be important questions for solution is obvious from the fact that so many are suggesting remedies, getting up organizations, societies and unions for protection of the good and suppression of the bad craftsmen. The outcome of these endeavors is veiled in the hereafter. Possibly the earnest search for the right path out of this labyrynth may ultimately succeed.

Ignorance is not the cause of all ambiguous orders. One of our best workmen lately sent in for a ten-leaf pinion of a particular size by the wire guage. It was sent, and returned with the message that he wanted a cannon pinion; that came back with an order for a ten-leaf hollow centre pinion, which was really the one required. This was simply carelessness. Another sent a written order for a P. S. B. hole jewel for balance wheel. The workman himself returned the jewel, and petulantly asked why we did not send what he ordered. We said the order had been filled as well as its obscurity would allow. He replied there was no obscurity about the order. The explanation that there was an *upper* and *lower* hole silenced him but did nor please him; he selected a cock hole, but how were we to know *which* he wished.—*R. C. in the Jewelers' Journal.*

JOHN HARRISON.

THE FATHER OF ALL CHRONOMETER MAKERS.

The following account of John Harrison and his works was recently published in an English paper:

John Harrison was born at Foulby, near Pontefract, Yorkshire, in the year 1693, his father, Henry Harrison, being a carpenter at that place, who was married in the month of July, 1692, at the parish church of Wragby, to Elizabeth Barber, of the same parish, where their eldest son John was baptized, it is said, on March 31st, in the following year. The father was in the habit of repairing clocks, and as much of the mechanism of the larger clocks was, in those days, frequently made of wood, the carpenter was very often called upon to repair them. It is said that during an attack of small-pox, from which young Harrison suffered at the age of six years, a clock on his pillow was the only thing that would keep him quiet. In the year 1700 his parents removed to Barrow, in Lincolnshire. Here he attracted the attention of a clergyman, who lent him a MS. copy of the lectures of Nicholas Saunderson, the blind Lucasian professor of mathematics at Cambridge, which he copied with all its diagrams. His early devotion to mechanical pursuits led him to give his attention to the improvement of clocks, and in 1726 he had constructed two, chiefly of wood, in which he applied the escapement and compound, or, as it is called, gridiron pendulum, of his own invention. In 1713 an Act of Parliament, 12 Anne, cap. 15, was passed, the preamble of which recites as follows: "Whereas, it is well known by all that are acquainted with the art of navigation, that nothing is so much wanted and desired at sea as the discovery of the longitude for the safety and quickness of voyage, the preservation of ships, and the lives of men; and where.

as, in the judgment of able mathematicians and navigators, several methods have already been discovered, true in theory, though very difficult in practice, some of which, there is reason to expect, may be capable of improvement, some already discovered may be proposed to the public, and others may be invented hereafter; and whereas, such a discovery would be of particular advantage to the trade of Great Britain, and very much to the honor of this kingdom." A commission was appointed under the Act, upon which a large number of officers of state and men distinguished as mathematicians, mechanics and navigators were appointed, and a reward of £20,000 was offered to any one who could discover a method whereby the longitude at sea could, within certain stated limits of exactness, be ascertained. He came to London in 1728 with drawings of an instrument for the purpose, hoping to get assistance from the commission for its construction, but the Astronomer Royal referred him to the then great watchmaker, George Graham, a member of the company, who advised him to make his machine first and then apply to the commission. He returned home to do so, and in 1735 again came to London with his first timepiece, which was examined by several members of the Royal Society (Halley, Graham, and others) who certified its excellence to the Board of Longitude; and in 1736 Harrison was sent with it on a voyage to Lisbon and back to test its performance. In this voyage he is said to have corrected the reckoning nearly a degree and a half. In 1737 the commissioners presented him £500, and encouraged him to proceed in his improvements.

In 1739 he produced a second instrument, and in 1749 a third, which erred only three or four seconds in a week. For this he obtained the annual gold medal of the Royal Society. Some time afterwards practising improvements upon watches, he was induced to make a fourth machine in the form of a pocket watch, about six inches in diameter, which he finished in 1759. Trial of its accuracy was made during two voyages, when his son William went in charge of it, one to Jamaica and the other to Barbadoes, in 1764, in H. M. S. Tartar, Captain Sir James Lindsay. In both voyages it corrected the longitude within the nearest limits required by the Act of Queen Anne, and entitled him to the reward of £20,000, one moiety of which he received in 1765, and the remainder, not without some official delays, at a subsequent period. In later years he made a fifth instrument, which, on a ten weeks' trial at the King's private observatory at Richmond, was found, it is said, to have erred only four and a half seconds. As will be seen by his works in the company's library mentioned below, he had a musical ear, and made experiments on sound with a curious monochord of his own invention, from which he constructed a new musical scale or mechanical division of the octave, according to the proportion which the radius and diameter of a circle have respectively to the circumference. He died at his house in Red Lion square, in his 84th year.

TRICKS OF JEWELRY THIEVES.

SOME CUNNING DEVICES — LOSS AND RECOVERY OF DIAMONDS—WORKINGS OF THE PROTECTIVE UNION — A GALVANIC THIEF CATCHER.

(*From the N. Y. Evening Post, Dec. 29.*)

Dealers in jewelry are particularly exposed to losses through thieves and swindlers, as their goods, more than those of any other tradesmen or manufacturers, contain great marketable value in a small compass, and therefore afford especial temptations to the dishonest. This season of the year is the jewelry-thieves harvest-time, as the shops which they visit are largely stocked with goods, which are frequently on the counters, and the number of customers in search of holiday goods distract the attention of the proprietors and salesmen. Even the wholesale dealers, who hang out placards marked "No goods sold at retail," do a quiet little retail business during the holiday period, when their acquaintances come around under the impression that they can get goods cheaper from them than from the retailers—which, by the way, is usually a mistaken impression, except in the case of persons who are thoroughly on the "inside" of the trade. The wholesaler is bound to protect the retailer, and wishes to make a good profit himself. Besides, this practice gives the wholesale dealers a good opportunity to dispose of old stock which has gone the rounds of the trade "on memorandum" (that is, sent out on approval), and which would otherwise go into the melting pot.

The thieves, both male and female, who are frequently of very good appearance, hang about the jewelers' stores until they see some respectable looking person enter, and then go in with them. They usually say that some friend advised them to come to that store to look at a particular line of goods, and they commonly ask for some standard article. Then, if they can get some young and inexperienced clerk to wait upon them — and they always try to get served by a salesman of that kind—the chances are that they will carry away with them a great deal more in value than they buy. Sometimes they buy nothing, but usually they make some small purchase, so as to cover their game more effectually.

The "umbrella trick" was a very successful device of the thieves a few years ago, but it is now pretty well known to the trade, and is therefore but little practiced at present. Before its secret was detected, a well-dressed thief would enter a store with an umbrella in his hand, closed, but not rolled up. He was usually accompanied by one or two confederates. Seating themselves by the counter, they would ask to be shown a variety of certain goods, and in passing the articles from one to another, the principal would deterously drop one now and then within the loose folds of the umbrella. When a number of chains, rings, or bracelets had thus been stowed away, the man with the now valuable umbrella would suddenly remember an engagement, and bid goodbye to his companions, who would cover his retreat by buying some trifling ornament.

Some time ago a clever rogue was successful in robbing several diamond merchants, in this city, of costly gems, having equipped himself by smearing a little wax on the end of his nose and providing a number of handkerchiefs in his pockets. He was further prepared by wearing spectacles and appeared to be very nearsighted. When a package of small unset diamonds was shown to him, at his request, he would take it to the window, and hold it very close to his face. Simultaneously he would bring the end of his nose against a diamond, and make use of a handkerchief to conceal and remove the stone which had adhered to the wax. By affecting to have a bad cold, and always using a different handkerchief, he was able to abstract a number of stones from the same package. His last operation of this sort had an unsuccessful ending through his mistake in taking out a handkerchief which he had used already. A

diamond fell from it and rolled upon the floor. Hoping that this was unnoticed, but not daring to remain, he hastily excused himself and went to the door, but found it securely fastened. One of the firm of diamond dealers, by pressing an electric button under his table, had shot a bolt at the entrance, and when the thief turned round a revolver was pointed at his head. He was obliged to submit to a search, and a number of diamonds were found in the handkerchiefs distributed through his clothing. His arrest followed, and he was sent to state prison.

After this a man with a cane executed a theft very neatly in a New York diamond house. Pointing over the counter with his cane at an open package of unmounted stones, and asking to be shown a certain one, he lightly touched a gem with the end of a stick, which had been dipped in a glutinous cement. A diamond worth $600 adhered to the tip, and the thief got away undetected. Some time afterward he was caught while attempting the same trick in Philadelphia, and was identified by his New York victim.

Recently one of the "box-men," or drummers, who travel for small jewelry factories in Providence or Attleboro, called at a well-known jobbing house here, and was so gratified at his warm reception by one of the firm, who happened to be in a particularly good humor, that he set his box down on the floor and entered into conversation without immediately proceeding to business. When he turned to take up his box it was missing, and he has never seen it since. Undoubtedly a thief had walked into the place "on speculation," and seeing the unguarded box had quietly walked out with it. Its contents were worth several hundred dollars, although most of the articles were of only six to ten karat gold.

Sometimes the thieves adopt still bolder methods. Within the past fortnight a man entered a jewelry store in Maiden Lane, and after looking at a number of gold watch-chains, suddenly snatched three of them and dashed out of the door. A hue-and-cry was instantly raised, and and a number of persons began running. The thief ran into a "pal" on the sidewalk, and knocked him down, transferring the chains in the scuffle. When seized and accused of the robbery he indignantly denied the charge and demanded to be searched. He said that he had merely run in pursuit of the real offender. As he had got rid of the stolen articles, and as no one could positively identify him, he was released. His confederate, of course, had lost no time in disappearing.

Fastening the door of a jewlry store on the outside by means of a cord, and then smashing the show window, forms a method of robbery so extremely bold and dangerous that it is rarely attempted at present, although some years ago it was not very uncommon. Some of our readers may remember the ingenious effort once made to rob a Broadway jeweler's window which projected over the sidewalk. At night a thief cut a hole in the bottom of the window, and neatly plugged it up again. The next day he had a well trained boy crawl under the window, and, by means of a long wire with a hook on the end, pull down through the hole a number of gold chains, etc. The trick was defeated by the investigations of a salesman, after he had been astonished to see chains and bracelets creeping about in the window as if endowed with life.

A few seasons ago a certain down-town jeweler determined to turn the tables and cheat the thieves. He got together a lot of old rubbish which had been designed to look like gold, and had the chains, etc, newly dipped and polished. The articles were such goods as the alleged rolled plate Roman gold bracelet which are not rolled at all, but simply German silver dipped in plating solution. When visited at that holiday time by customers whom his experienced eye recognized as probable thieves, he would lay before them a quantity of this special stock, tell them to make their selection, and carelessly turn his back. The trap was successful, and quantities of the trash carried away before the end of the holidays. One thief was so disgusted that he wrote a letter to the jeweler, telling him that if his goods were a fair sample of those in the neighborhood, the shopkeepers were worse thieves than any in the "profession."

The practice already mentioned of letting jobbers have goods from manufacturers "on memorandum" is one that gives excellent facilities to swindlers at this time of year, when all the firms are too busy to make careful investigations, if things appear right on the surface. Very recently, it will be remembered, an innocent-looking, rosy-cheeked young man obtained considerable quantities of valuable goods from several prominent houses in this city by presenting memorandums with the letter-heads of well known jobbers. His operations were finally checked simply by the fact that in one case the goods were not ready for delivery when he called, and were afterwards sent to the firm believed to have ordered them. The suprise of the latter led to an explation, and this to a revelation in the newspapers which stopped the swindler's career. The rogue was not caught, however, and it is believed before his methods were exposed he had obtained jewelry to the amount of several thousand dollars. On this last point his victims have been very reticent

Sometimes the thieves who visit jewelry stores rob a customer instead of the proprietor. About two years ago a banker in Wall street gave to his wife a large sum of money, some $4,000 or $5.000, for the purchase of a set of diamonds. He took her to a jeweler's, introduced her, and then hurried away to attend to some business. The lady placed her pocketbook containing the money inside her muff, and laid the latter on the counter while she examined an assortment of gems. Meanwhile a very well dressed young man took a seat by the counter near her, and looked at some rings, finally purchasing one for about thirty dollars, and leaving the place. When the lady looked for her pocketbook she was overwhelmed by the discovery that her muff was empty. The young man was doubtless a professional thief, who had entered the store to "take chances," and was probably as much suprised as gratified when he ascertained the amount of his "haul."

Persons who are in the habit of handling valuable goods are apt, in time to grow careless in regard to them, and therefore diamonds are often lost through gross negligence, as well as by thieves. A few years ago a broker in gems lost a fine pair of diamonds, valued at $3,000, while on his way to a customer in Wall street. They were advertised, a few days afterward a lawyer reported that he had found the jewels in the possession of his office boy, who had picked them up in the street, and, ignorant of their value, had been using them as jack-stones. The recent case in John street will be generally remembered, where a little Italian bootblack picked up a package of twenty-one small diamonds, valued at $2,000, and sold them to a jeweler for a dollar. The purchaser immediately advertised them, and for days was visited by all sorts of "frauds," who pretended that they had lost diamonds, and made desperate guesses when asked to describe the stones and

14 AND 18 KARAT GOLD WATCH CASES,

MANUFACTURED BY

THE AMERICAN WATCH CO.,

OF WALTHAM, MASS.

All Cases of our Manufacture are Stamped (A. W. CO.) which indicates that they are manufactured by the American Watch Company.

We are informed that cases are offered to the trade stamped W. W. Co. This is evidently done with the intention to deceive and further the sale of inferior cases. There is no Waltham Watch Co., but the name is used by us as a registered trade mark on a well known grade of movement.

AMERICAN WATCH CO.,

ROBBINS & APPLETON, - General Agents,

NEW YORK.

their wrappings. The diamonds were in fact folded up in a paper packet, such as is always used for the purpose by dealers, on the outside of which was a complete memorandum of its contents. This proved to the custodian of the gems that they had been lost by some one in the trade, and the owner finally appeared and identified them. The boot-black was then sought out and suitably rewarded.

Some years since, a diamond dealer here picked up an unset stone worth about $800, with a pair of steel nippers and as he turned it about to examine it closely. he happened to press the nippers in such a way that the gem flew out. And the search was made, but the diamond had vanished as completely as if it had changed into air. For weeks afterward the search was resumed at intervals : all the sweepings of the store were preserved and not even a scrap of paper was thrown away. Finally, the last hope of ever finding the stone was abandoned, and its value set down to "profit and loss." The next winter, when the diamond dealer was about to put on a heavy overcoat which he had worn the previous season, he noticed a little rip near the velvet collar. As he was about to hand it to his wife, and ask her to take a stitch in it, he chanced to feel a small, hard substance in the skirt of the coat, between the cloth and the lining. A little ripping was done and the long-lost diamond was revealed. At the time the stone flew into the defective seam the coat was hanging up on the wall of the store.

BUSINESS CHANGES FOR MARCH.

W. R. Roberts, fancy goods, Toronto, giving up business ; E. Burrell, axe mfr, Belleville, dead ; T. L. McNeece, hardware, Tottenham, selling out and going to Manitoba ; K. C. Marshall, jeweler, London, seized for rent ; J. D. Gunn, hardware, Springfield, business for sale; Chalmers & Carney, Emerson, Man., business for sale ; H. Hodges, crockery, Winnipeg, Man., sold out to J. A. Moore ; Jno. Dade hardware, Beeton, style now Dade & Kemp ; D. R. Dingwall, jewelry, Port Hope, business for sale.

BUSINESS NOTES.

Mr. Wm. Perret, jeweler, of Orangeville, has located himself in Winnipeg, and writes us to say that he expects to open his new store in a few days. Mr Perret is well known in Ontario as one of the most skilful workmen that ever came to this country, and we have no doubt that his skill will be fully appreciated and recompensed in his new field of labor. We wish him success in his new venture.

Mr. Chas. Robinson, of the "Sheffield House," of this city, has returned from Winnipeg, Man. He reports the jewelry business there as being overdone, and advises those who have a good paying business in any of the older provinces to stick to it in preference to going to the North-West.

The Unkindest Cut of All.—About a month ago we noticed the fact that Mr. S. P. Kleiser had a person arrested for an alleged attempt to steal some unset diamonds. The Police Magistrate dismissed the case for want of sufficient evidence, and now the alleged thief threatens to enter an action against Mr. Kleiser for false arrest. This is unkind to say the least.

Change of Firm Name.—Our readers will notice a change in the firm name of Messrs. Zimmerman, McNaught & Co., the name of Mr. Lowe being substituted instead of the "Co." as heretofore. As Mr. Lowe has been a member of the firm for the past five years, the change is merely in name, the partners being as before, John Zimmerman, William K. McNaught and W. G. H. Lowe.

We have just been handed one of Messrs. P. W. Ellis & Co.'s new catalogues of tools, materials, &c., and without any flattery, must pronounce it the best thing of its kind ever published in Canada. This catalogue embraces almost every article known to the watch repairing business, and may be safely taken by the retail trade as a reliable guide for the purchase of goods of this kind. Wherever possible the articles are illustrated by first-class wood cuts, a feature which not only improves the appearance of the book, but renders it much more valuable to the dealer. Taking it altogether, it is highly creditable alike to Canadian enterprise and workmanship, and we trust that the firm issuing it will by largely increased orders be amply repaid for the heavy outlay involved in its publication.

Very grave reports regarding the moral character of Mr. A. Brownley, jeweler, of Ailsa Craig, Ont., are being freely circulated by the papers. The charge is mainly that he attempted to seduce Miss Howie, a niece who resided with him. This charge Mr. Brownley emphatically denies, declaring it to be a case of blackmailing, while Miss Howie insists on sticking to the truth of her statements. So far, things wear a very ugly appearance for Brownley. and we only trust that he can satisfactorily controvert the charges brought against him, as we would be sorry to think that a person who for many years had borne such an honorable reputation as Mr. Brownley, should be guilty of an action so dastardly.

New Electro-Plated Ware Factory.—The first annual meeting of the Toronto Silver Plate Co., was held at the Rossin House on Saturday afternoon last, Mr. W. K. McNaught, of Toronto, in the chair. After the by-laws of the Company had been discussed and carried, the following officers were elected : President, J. A. Watts, Toronto ; Vice-President, J. Robertson, Hamilton ; Secretary, J. A. Lash, Toronto ; Directors, Messrs. Drake, Montreal ; Murray, Loudon, and Partridge, Hamilton. The Company's new brick factory, at the corner of King and Portland Streets, is fast reaching completion, and will be one of the most complete of its kind on this continent. It is built of red brick and has a frontage of 100 feet on King Street and a depth of about 200 feet. Mr. Watts, the Manager, expects to have it in full running order in about three months.

Enterprise.—We are glad to notice the removal of Messrs. Zimmerman, McNaught & Lowe to their new and enlarged warehouse, on Wellington Street East. These premises they have fitted up in the latest and most improved style, and now possess one of the finest wholesale jewelry establishments in Canada. The jewelry vault, which is lined with steel, and guarded by one of J. & J. Taylor's most approved steel burglar proof doors, is a curiosity in itself, and well worthy the inspection of jewelers who desire to put their stock in such a position that they can sleep soundly at nights. The accountant's and private offices are fitted up in first-class style, and the firm have ordered a telephone from the "Bell Telephone Co.," which will not only largely facilitate their own business, but prove a very great convenience to their customers. The heat is at present supplied by a hot air furnace, but arrangements have been completed whereby the premises will in future be heated by steam, it being considered much healthier and less injurious to the silverware and other stock. The firm are now fairly settled down, and will be pleased to have their friends and customers call and inspect their new premises. Such enterprise is highly commendable, and we wish this well-known firm a long and prosperous career in their present quarters.

WORKSHOP NOTES.

The silver, which is held in a dissolved state in the decanted liquid disselved by adding by degrees small quantities of muriatic acid, which will precipitate the silver as chloride; allow to settle after each adding, and continue to repeat until no more clouding be observed. Decant the fluid carefully from the precipitated chloride of silver, wash three or four times with warm water, dry and melt with carbonate of soda, which will realize chemically pure silver.

To strip the gold from old fire-gilt watch-plates. Remove all steel parts and cover the plates with paste of two parts of sulphur to one of salmmoniac in vinegar, anneal in charcoal-fire and plunge into water acidulated wfth sulphuric acid, and leave therein for several hours, and, before removing. brush with a fine and soft scratch-brush, when the gold will become lossened in the shape of fine scales, the water is then filtered, and the gold which will remain ou the filtre, washed dried, and melted with finely powdered borax and saltpetre.

To recover the gold from old silver-gilt lace. First of all, extract all silk or cotton not directly interwoven with the metallic threads, and burn the lace in order to destroy all remaining silk and organic matter, wash and clean well of all ashes, press the silver threads into as small a compass as possible, dry and dissofve in pure nitric acid (free from muriatic, which is tested by dropping a small piece of nitrate of silver into and no clouding will be produced), diluted again with an equal quantity of distelled or boiled rain-water, let stand undisturbed for several hours, in order to allow the gold, which will remain undissolved in minute particles, to settle, decant the liquid carefully from the sediment and wash the same for three or four times with warm distilled water,

The Watchmaker, Jeweller and Silversmith,
A Monthly Illustrated Journal. Published in London.

The Representative Organ of the Watch, Jewellery and Kindred Trades in the United Kingdom.

It is full of original information and thorough practical instruction contributed by the leading writers on the various subjects connected with the above trades. The text is well illustrated by wood-cuts, and two supplements of artistic designs for jewellery, etc. accompany each number.

This important Trade Organ, now in its seventh year of publication is in the hands of every British Watchmaker, Jeweller and Silversmith, and is therefore a most valuable medium for manufacturers requiring publicity in Great Britain.

Our list of permanent contributors includes such names as: J. U. Poole, Richard Whittaker, Henry Ganney, Moritz Grassmann, J. Herrmann, E. J. Watherston, W. H. Singer, an ample guarantee for the sterling value of the journal. Subscription 5s. per annum.

adding the washings to the decanted solution; dry and melt the sediment with a small addition of equal parts of finely powdered borax and saltpeter, which will produce a button of fine gold.

Advantageous method to strip the silver from old silver-plated articles. Take a cast iron vessel and pour into strong sulphuric acid, add about one-eighth part of powdered saltpeter and bring to a boiling heat, dip into this acid a bucket made of sheet iron perforated at the side and bottom, therein place the articles to be stripped and keep moving about up and down until the coating of the silver has dissolved, lift the bucket out and let drip into the acid and rinse in cold water, remove the stripped articles and treat another lot in the same way. The dissolving of the silver will take but a few minutes in the beginning, will work slower after the acid has taken up a quantity of silver, and will cease to act when saturated with it The solution has the property of dissolving silver only, and barely affecting the inferior metals of which the articles to be stripped are constructed. The silver is reduced by pouring the solution whilst hot into a leaden vessel and immersing therein clean copperplates, when the silver will flock in a metallic state on to the plates, which are removed and washed in clean water, and the immersion repeated until no more silver becomes deposited on the copperplates; the solution is finally tried for silver by dropping into it a small quantity of saturated saltwater, which will produce clouding or precipitation if silver be retained in the acid solution; or the whole of the silver may be reduced by precipitation of salt solution; which should be added by degrees until no more precipitate is formed. The acid is then carefully decanted, the precipitate washed with clean water to remove all the acid dried and melted with carbonate of soda.—H. Bush.

To effect the best possible results in timing an ordinary watch to various positions, it is absolutely neccessary to strictly observe the condition of the pivots of the cylinder or staff in lever, etc, escapements, and the jewel-holes in which the pivots run. The pivots ought in all cases not be unnecessary long, be made conical at the shoulder and elongating, perfectly cylindrical for about one and a half the length of the jewel-hole, in order to rest freely on the cap jewel. When the watch is in a horizontal position, the point of the pivot should be quite flat, with merely the sharp edge removed and well polished; a pivot so constructed will work easy in all positions, and be least exposed to bending or breaking. The hole in the jewel should always be of the same length as the width of it, which is the proper size to equalize the fraction of the pivot, whether the watch be in vertical, horizontal, or slanted position. If the hole is found to be larger than the diameter, the length can easily be reduced with the aid of a diamond drill, the end of which to be of a round instead of a sharp pointed shape, or too large a hole may be reduced in a few seconds, the bars of the polished steel effectes in the hollow of the jewel is quite immaterial to the action of the pivot, as long as it is kept clean. Last of all, the balance should be carefully poised, and the balance spring be kept quite flat and free.—*From Albdrt Johann's Lehrbuch der Uhrmaceerkunst.*

SCIENCE AND OTHER NOTES.

In France a pearl costing sixteen dollars is now imitated for fifty cents or a dollar, and so successfully as to be sold at the price of the genuine article to any one not a veritable expert, and even the latter class are often puzzled. The artificial pearl, however, is simply a glass bead or globe which is first coated on the inside with a glue made of parchment, then treated with a peculiar so-called "essence," after which it is filled with wax. The essence is the chief pearly ingredient, and is obtained by rubbing together white fish, so as to remove the scales; the whole is then strained through linen and left to deposit its sediment, which is the essence in question. It requires about 17,000 fish to produce a pound of the pearly essence.

Sheffield Exports to America.—The exports from Sheffield to the United States during November last show a great increase upon the value of the goods sent from that town to the United States in November, 1880, as may be ascertained from the appended figures:—

	Steel	Cutlery	Total Exports
November, 1880	£30,418	£23,068	£65,299
November, 1881	34,667	20,387	98,849.

The steel exports are more by 2,649*l.*; but the cutlery exports show a decrease of 2,680*l.* The total exports for the month, however, show the large increase of 33,550*l.*

In the time of Alfred the Great the Persians imported into Europe a machine which presented the first rudiments of a striking clock. It was brought as a present to Charlemagne from Abdallah King of Persia, by two monks of Jerusalem, in the year 800. Among other presents, says Eginhart, was a horloge of brass, wonderfully constructed by some mechanical artifice, in which the course of the twelve hours *ad clepsydram vertebatur*, with as many little brazen balls, which, at the close of each hour, dropped down on a sort of bells underneath, and sounded the end of the hour. There were also twelve figures of horsemen, who, when the twelve hours were completed issued out at twelve windows which till then stood open, and returning again, shut the windows after them. It is to be remembered that Eginhart was an eye-witness of what is here described, and that he was an abbot, a skillful architect, and very learned in the sciences.

Jewelry Business for Sale.

The undersigned, who has been in the Jewelry trade in Chatham for 29 years, is desirous of Selling out. Stock about eight thousand dollars. A good opening for a Watchmaker to succeed to an established and paying business.

SHARE ALIKE.

In view of the want of an Insolvent Act, the bill introduced by Mr. Beaty, M.P. for West Toronto, providing for the ratable distribution of an insolvent's assets is both timely and well considered.

As things stand at present, an insolvent is practically able to elect which of his creditors he will indemnify against loss, by giving him preferential security and making the others "pay the piper." If he is honest enough to refuse to be a party to any such disreputable transactions, his estate is practically at the mercy of the first creditor who likes to sue him and get judgment. In any case it is the first come that is first served, and the creditors who have their accounts closed by note are in the delightful position of having to stand quietly by and see their more fortunate competitors walk off with their rightful share of the estate. This is not justice, and the sooner this condition of things is changed the better it will be for both debtor and creditor alike.

Every wholesale merchant will agree with the proposition that when a dealer fails, his estate should be divided *pro rata* amongst his creditors, but while conceding the truth of this principle, few if any of them are generous enough to carry it out practically, especially those who have the start of their competitors in any bankrupt estate.

The man however who will laugh at you when asked to give up his security and rank as an ordinary creditor in such a case, sees things in a very different light when some one else has the start of him and he is out in the cold. Then it is that he is prone to mourn man's inhumanity to man and to wish that the Insolvent Act, bad as it was, was in force again. Mr. Beaty's idea is to force merchants to do, what most of them admit they ought to do in all cases of insolvency, that is, to divide the assets of the insolvent in proportion to the amount of the claims. The bill does not provide for the discharge of Insolvents or anything of that kind, its object is simply as stated above, and for this reason it should receive the support and encouragement of every thinking merchant.

If we are not to have a practical Insolvent Act it is patent to everybody at all acquainted with the present state of trade that some such protective measure as this is a necessity. Every day instances of the most glaring description come to light in which insolvents legally ignore the rights of their creditors and place their assets where they will get the most benefit from them.

One of the most glaring instances of the injustice of the present system, or rather want of system, is that of G. Morrison, a well-known retail dry goods merchant of this city. Mr. Morrison appears lately to have discovered that he was in insolvent circumstances, his liabilities amounting to about $60,000, and his assets to less than $40,000. His principal creditor is the firm of Stewart & McDonald, of Glasgow. To this firm and their representative in Canada, Morrison is said to owe nearly $48,000. Outside of that he is indebted to Toronto and Montreal houses to the amount of some fourteen or fifteen thousand dollars. Before these other creditors were aware of anything out of the ordinary course of business having occurred, it turns out that the principal creditors, Messrs. Stewart & McDonald, have judgments and executions in the Sheriff's hands for the full amount of their claim. These executions will, of course, exhaust all Mr. Morrison's means, and the other creditors have no prospect of recovering one cent, unless they succeed in setting these executions aside, which in the present state of the law, it is very unlikely they will be able to do. All the other creditors profess a willingness to have Mr. Morrison's assets rateably distributed, but there is no means by which they can have this done.

This case of Mr. Morrison's is no exceptional one, but a fair sample of what is transpiring every day in our midst.

Fortunately the country is prosperous, and the number of failures is proportionately small to what it formerly was, but if the samples are any criterion, they indicate that a mercantile reign of terror would set in upon us should the next era of depression find us without a Bankrupt Act. On the principle that "half a loaf is better than no bread" our merchants should use their utmost endeavors to help Mr. Beaty's law through parliament and have it placed upon the statute book as speedily as possible. Its effect would at least be salutary, by putting all unsecured creditors on a level, and taking away from the insolvent the greatest incentive he has at present to commit a dishonest action.

CAPITAL V. LABOR.

The struggle between Capital and Labor at present going on in many parts of this country is but another example of how easily the unthinking masses can be led away by demagogues to their own detriment. This question between Capital and Labor is no new one; for hundreds of years it has periodically come to the surface, only to be settled as the exegencies of the period demanded. If the working men fully realized that in striving to carry out their designs they are combating one of the first principles of mercantile economy, we think that they would look more carefully before they leaped into all the losses and discomforts attendant upon a "strike."

Labor is the working man's capital or merchandise, and like any other merchant he has the unquestionable right of selling it to the best possible advantage, and to receive as much as he can therefor. But he must remember that like all other articles of merchandise the price depends almost entirely upon the demand and supply. If the demand is great and the supply small the price paid will be high, if the demand be small and the supply in excess of the requirement, then of necessity the wages will be lower. In other words when work is plentiful and laborers scarce the competition is between the employers or capitalist, and labor is enhanced, but when the contrary is the case, the competition is necessarily between the workman and as a natural consequence the value is depreciated.

This law of supply and demand is a natural law, and trades' unions might as

well ask the sun to consent to rise in the west and set in the east as to expect that they can by any combination effect any radical change in its workings.

It is true that in some cases such combinations temporarily effect their purpose, and for a time it seems as if they had triumphed, but with the pressure of hard times comes a scarcity of work and a consequent lowering of wages back to the former low water mark. This constant change of value in labor is as certain as the ebb and flow of the ocean sides, and as we have said before, any attempt to permanently change the effect of this natural law would be attended with failure in either case.

There is nothing antagonistic between capital and labor, if their duties and rights were properly understood. They are naturally dependent the one upon the other, and unless they walk hand in hand neither of them can expect to be properly remunerated.

The striking workmen declare that they are bound to refrain from work until they can get the price they ask for it; this is all right enough as long as they do not interfere with those who are willing to work and take the rate that is offering. The strikers, while desirous of getting the highest price for what they have to sell, very illogically refuse to allow the "Bosses" to purchase the labor they require in the lowest market they can find. Here is the weak point of these strikes, and here it is that they fail in effecting any permanent good.

We think that the employers of Toronto have done a wise thing in "taking the bull by the horns" and declaring that they will only treat with their employees individually and not as a body. The weakest point of these Unions is that they demand that their members shall all be paid the same wages, good, bad and indifferent, it makes no matter, the pay must be alike.

If the Unions would grade their members according to their ability as workmen, the evil would be more than half remedied, but this they refuse to do, and as a consequence the first-class workmen that can almost at any time and under any circumstances command the very highest rate of wages going, are compelled to drag their less skillful but more demonstrative companions up the steep incline of necessity.

There are many other points of this subject upon which we could touch did space permit, but we will only close with the hope that ere long the workmen of this country will see that capital is neither necessarily oppressive nor antagonistic to labor, but that the rights of each being properly understood and enforced, the result will be a more skillful and higher paid class of mechanics and a better feeling between the employer and employed.

THE JEWELRY TRADE AND THE N. P.

It is perfectly wonderful how differently trade questions appear when viewed through political spectacles. From a Conservative standpoint the fiscal policy of the present Government is all that could be desired to make the country prosperous and happy, while the Reform view of the same question seems to be that it is a most unjustifiable interference with the liberties of the people, and that on account of its oppressive tendencies the country is going headlong to the dogs.

Both of these views are no doubt highly colored, according to the sources from which they eminate, and every candid person must admit, that while both are correct in some particulars, both are also wrong in others, and that the correct estimate probably lies midway between the two extremes.

The extreme diversity of the views upon this subject reminds us very much of a landscape we once viewed in a Scottish museum, which by means of different colored panes of glass, set side by side, the observer was enabled to view in every transition of nature —spring, summer, autumn and winter. Although the illusion was perfect the scenery was always the same; it was only the difference in the color of the glass looked through which make it appear different. So it is with such subjects as this, the facts are always the same and it depends entirely through which party spectacles we view them, how they are going to appear to us.

In the few sentences we propose to write upon the present relation of the jewelry trade and the N. P. we shall, ignoring entirely the green and blue goggles of politics, try and view the question through the clear crystal of mercantile experience.

First, then, has the N. P. benefitted or injured the jewelry trade of Canada? To this question, we are sorry to say, we cannot give the unqualified assent that we should desire. We are, however, of the opinion that on the whole the present fiscal policy has been favorable rather than otherwise to it, but that its success would have been more real could the Government have been induced to reorganize it in accordance with the wishes of the great bulk of the trade. There is no doubt that to some extent the higher duty on jewelry has in some small degree added to our manufactures, but we do not think that to the additional 2½ per cent. duty imposed can be traced the whole of the large increase.

Upon the whole we rather incline to the opinion that the manufacturing jewelry trade has increased and prospered in spite of the tariff more than in consequence of it.

As we said before the addition of 2½ per cent. was not a very heavy protection to our manufacturing jewelers, and we do not think that any one who hesitated to embark in its manufacture under the old 17½ per cent. has been induced by this limited increase to change his mind regarding it. That this increase of duty has had an appreciable effect on the quantity of goods smuggled into this country there can be no doubt, for just in proportion as it increased the value of regularly imported goods, it made the incentive to smuggle all the greater by making the reward better worth while running the risk for. We have always said that if the Government can possibly collect this duty by all means let them levy it, because it will help the Canadian Manufacturer without in any way injuring the importer, but if they cannot possibly collect this duty (and there cannot now be any doubt upon this point) then they should protect the trade by the only method in their power, viz: by lowering the duty to a point where smuggling would cease to be profitable.

We said before we thought the jewelry trade had prospered, not because of the tariff but in spite of it; the real reasons for its growth and prosperity, we think, consist in the fact that the good harvests have largely increased the demand for certain classes of goods that can be profitably manufactured here, and equally important that the long period of depression in the English jewelry trade had rendered business so unprofitable that numbers of skilled workmen were forced to emigrate to this country in search of

the employment they were unable to obtain at home. The demand for their style of work being very small in the States they naturally came to Canada, and hence we find a class of goods made in Canada to-day, by skilled English workmen, which a few years ago we could not have produced at all, much less at a price which would have enabled them to compete on favorable terms against the imported article.

In proof of this we need only adduce the fact that with the exception of gold chains, and probably watch cases, the jewelry manufactured in Canada is mostly of English design and supplants goods of English and not of American manufacture.

For this state of affairs two things are responsible; first that English jewelry being much harder to smuggle than American, the duty levied on it is really more protection in effect, and second, that English jewelry employs comparatively little machinery in its manufacture as compared with the American, and its manufacture is therefore a very much less expensive undertaking.

With our present limited population, and a country divided from the United States for nearly two thousand miles by an imaginary line only, the facilities for smuggling are so great that any person who would undertake to erect and run an extensive jewelry factory upon the American system would need to have a good deal of both faith and capital to make the venture at all, and we doubt that even with plenty of each and experience thrown in, he could make his venture succeed.

The jewelry trade is a present at a critical period of its history; if properly fostered by efficient legislation, we think it will grow to large proportions, but if hampered, its growth will be slow if it grows at all. What is wanted is a wise and careful re-adjustment of the tariff, which while lowering the duty on certain lines will yet compensate for the reduction by giving a *bona fide* protection as far as it goes, and also by lowering the duty on the tools and raw material necessary to its successful carrying on. If this were properly carried out we think a great inpetus would be given to the trade. If anything were wanting to prove our point that the present high tariff on fine jewelry is not protection but the contary, the position of the silver trade would amply establish it. At the time the present tariff came in force, there was but one factory in Canada for the manufacture of Electro-plated ware, which enterprise has since through mismanagement passed out of existence. To-day two of the largest factories in the United States have important and well equipped establishments in this country, and a Canadian company is at present erecting a third factory which will be equal to either in every particular. By the end of the present year there will be probably two hundred hands employed in those three factories, with an aggregate output of half a million dollars worth of manufactured goods. That this is a direct outcome of the National Policy, no one can doubt, and we unhesitatingly assert that if it had not been for the protection afforded by the present tariff not one dollar's worth of these goods would have been manufactured in this country. Domestic manufactures we had none, and the American manufacturers held almost undisputed possession of this market, from which after a short struggle for supremacy they had completely driven their English competitors.

This being the case, it is easy to see that if they had all agreed to remain at home and supply our market with goods manufactured in the United States we would still have been compelled to buy from them because we could not better ourselves. The high duty however, made it a paying venture to start branch factories here, even though it required an immense expenditure of capital to do it properly, and the result has been what we have indicated above. But does any one for a moment suppose that these factories would have ever been started if Electro-plated goods could have been smuggled as easily as jewelry. We think not; it is because the bulk of such goods is large compared with their value, that the duty levied is a real protection to the manufacturer.

On the whole as we said at the outset we think the present tariff has favorably effected the aggregate manufacture of jewelry and silver goods in this country. Now as regards the selling price, has the tariff been of any benefit? We think not, but on the contrary, that the contrary has been the effect. In the matter of jewelry it is a fact, without doubt that nearly every line of imported goods is sold as cheap if not more cheaply than before the rise in duty, while in goods manufactured in Canada the competition has reduced the prices in many cases far below the old prices of ant N. P. days. Thus while the retail merchant and consumer has reaped a decided benefit by the tariff, it has effected the wholesale and manufacturer adversely in the matter of profits, although they have probably been fully recouped for this loss by the excess of business, caused by a better control of their home market. In the Electro-plated ware trade, although a duty of 37½ has really been collected, prices remain as low, if not lower than at any former period. This is to be accounted for by the competition amongst the Canadian manufacturers themselves, also by the fact that American houses that have not got branch factories here have been willing to pay the duty and compete with home manfactured goods in price, in order to keep their hold on this market and afford themselves an outlet for their surplus goods. In this line also, a judicious re-adjustment of the tariff would help our manufacturers largely, and it is to be hoped that the Government will see their way clear to offer all the encouragement they possibly can to these industries, which are not only new but well worthy of cultivation, inasmuch as they employ a large number of skilled workmen, who earn good wages and who are a scource of strength to any country in which they live. It is by building up such industries as these, that Canada is to be made a country worth living in, and if we do not want for ever to remain mere hewers of wood and drawers of water to other nations we should see to it, that our young factories get allthe real protection we can incidentally give them.

Selected Matter.

THE BRITTLENESS OF EMERALDS.

A case was decided in England a short time since which has considerable importance for those who are fortunate enough to possess valuable emeralds. Dr. Lynn, the well-known conjuror was summoned to make good the value of an emerald ring which had been entrusted to him at one of his entertainments by a visitor for the preformance of a certain trick. Somehow or other the stone became broken and the allegation of the plaintiff was that the damage had been done by Dr. Lynn himself, while smashing with a hammer the egg in which the ring was finally found. Now it says much for the cleverness with which the trick

was preformed that the plaintiff firmly believed his ring to have been somehow smuggled into the interior of an egg. Of course this was not really the case; the adroit prestidigitator had the trinket elsewhere all the time and only made it appear as if coming out of the broken egg. However there was no doubt about the stone being broken, and the sole thing, therefore, was to ascertain how it came by the injury. Only at one stage during the whole trick was the ring subject to the slightest violence, and this was when Dr. Lynn received it from its owner into a receptacle that already contained several coins. If the ring was either thrown in or let drop so that the face of the emerald struck against an edge of one of the coins the blow might have been sufficient to cause a fracture, especially if the stone had a flaw previously. Almost all emeralds are more or less flawed; indeed it is doubtful whether such a thing as a perfectly flawless emerald has ever been known. The chances are, therefore, that the gem in question was in this imperfect condition, and that the concussion consequent upon its fall on the coins completed the fracture. Such, at all events was the judicial decision in the matter, and Dr. Lynn carried the day. But warned by experience he now always makes an exception in the case of emeralds when he is asking the loan of a ring. Not all the magic of the conjuror's art can piece together a fractured precious stone; that feat beats Dr. Lynn himself, marvelous as are some of his manipulations, and it is just possible that some county court judge might hereafter believe, as did the plaintiff in question, that this Piccadilly Wizard has the power of wafting trinkets into the interior of unbroken eggs. Emeralds will probably play no further part in conjuring performances.—*London Globe.*

THE DEMAND FOR THE ANTIQUE.

"We do considerable trade in June and July," said a dealer. "People often come in from the watering places to get the first chance at any good things we may have discovered at the May auctions. It takes us some time to patch them up to suit the market. Yes, there is always a certain demand for these worm-eaten but pathetic relics of the infancy of the republic. We sell to many nice people, who have a taste for the ancient and honorable in furniture, and then we have another class who buy freely and pay high prices. I refer to the newly rich. During the past ten years many of them have taken a kind of dislike to the word shoddy;' they have found out what it means, you see. As a consequence there arises a regard for the 'old antique,' as they call it, which increases our sales and raises our profits on everything classical and rickety in the way of furniture and decoratives. Folks that cannot show a long line of ancestors make up for it by good collections of not strictly reliable tables and chairs." "Is it in men or women that this mania predominates?"

"Women. Men get the fever, second-handed like, from their wives. We have to be wide awake in selling, for we can't make sales without asking high prices Some months ago a hostler came in with an old rag of a rug to sell. It was large, but an ugly, queer, faded-looking thing, evidently a worn-out imitation of those Persian or Turkish mats which look as though they had been dragged through some retail shop. I gave the man a dollar for the article, and my porter gave it a half hour's experience with a club, then I cut a long breadth out of the threadbare centre, squared the ends, and put a carpet sewer to stitching the pieces together, adding of course a heavy black fringe. Within a week two ladies called, and being of the new artistic school, they, of course, picked out the mat—the ugliest thing in the shop. How tender in color, said one, and she about hit it. It was tender in other respects, too, if she had only known the fact, 'A precious relic indeed.' said the other; Is it Moslem, sir?' Pure Moslem, ma'am,' said I: 'all wool—comes from the Adams family.' 'What is the price?' she asked. Now I'm an old dealer, but I hesitated for fear I should'nt ask enough to impress her. She took my confusion for a reluctance to sell, and from that moment her mind was made up. She took a careless turn around the room, by that time my mind was made up, too. No, no; I would'nt be willing to state the figure we settled on. It was private rates."

"Do you sell many of these old things?"

"The sales are not very large, but the profits are quite fair, quite fair. Antique furniture is our main hold; it sells right along. It is hard to keep up a really good stock. Here is a fine old set—all mahogany. I had to pick that up piece by piece, and some of it was pretty well smashed up. You see, it is finished in a peculiar style; all the table and chair legs are mounted on a lion's claw holding a brass ball—handirons to match. It's very rare and valuable—worth $1,600, some call them Hancocks."

"After the General, of course—so solid and heavy?"

"Oh, bless you, no. After old John Hancock, Govenor of Massachusetts, and signer of the Declaration of Independence. There have been at least a thousand sets of that respecable old gentleman's furniture sold here and in Boston. Mine is the only original set, and this is why I have taken the liberty to carve a rudimentary H on the the back of the roomiest chair. Every perfect set contains the old patriot's favorite chair. We always put a handsome silk band across the arms because we wish to retain for the purchaser the sole right to sit in it. This fine old piece is the chair known to have been used by Gen. Howe during his somewhat precarious residence in Boston at the revolutioary period. I have two letters strictly authenticating it. I regret to say, however, that from the number of Howe chairs in the market, that officer must have spent most of his time in moving from one chair to another, and done considerable more sitting down than fighting. This one is genuine.

"Certain lines of revolutionary articles are always good; people are only too anxious to believe in them. Washingtons, however, are difficult to sell. The public must draw the line somewhere, and its generally at Washingtons and Jeffersons. A dealer spoiled the market for Washingtons. You see he sold a secretary with a contemporary certificate, and some fool held it up to the light and found the water mark to be 1850. Such manifest rascality injuries' business; it wound up the Washingtons, and I had to mark down a Martha Washington bedstead to an Aaron Burr. I did sell a Jefferson hat stand three years ago, but it stretches an honest dealer's reputation to make many ancient sales. Mayflowers I cannot conscientiously handle; no amount of swearing will make them go. De Witt Clinton and Hamiltons are all sent to Boston just now, and they sent us B. Franklins and Adamses, all having ancient certificates and Boston post-marks —in short, the most reliable evidence. Some of the letters, you will observe, are pasted under the seat. Here is something from Philadelphia—a chair which belonged to the honored Penn. See its strength and capacity—evidently made to order. Now here is the original which

Nathan Hale sat on before his ex—"

"I see. Have you any sale for foreign goods?"

"Yes, but it doesn't do to keep more than three or four distinguished foreign articles in sight at a time. There's some furniture our public cannot swallow easily. As a rule, though, it is safe for a dealer to act upon the principle that his goods are as likely to be as authentic as not. If he doesn't know to the contrary, it is fair to affirm that his articles are what they look to be. Very many buyers, though, don't care for relics; they want respectable old furniture that looks as if it belonged to a wealthy grandmother. Here and there you've got to remark that an article was found in—well, almost in Julius Cæsar's garret. I had to sell a Maria Stuart sofa the other day. I had it laid out for a Hannah More, but had to mark it out to suit.'

"The sources of supply—that is for genuine geods—is getting weaker and weaker. Grand-fathers' clocks, for instance, of good style and in fair order are scarce. I sold my last one for $235. The customer told us plain out that he wanted something that showed 'ancestry,' and we let him have it. The New England States have been travelled through and through for them. Once in a while one turns up. The old carved bookcases and chests of drawers, mounted in genuine old-time brass, can be had now and then. Carved oak mantel and chimney pieces, tiles, tapestries, etc., are good when you can get hold of them. One trouble is growing weaker every year. We cannot get anything like full sets. Sometimes we have to wait a year or more before we can decently complete a room. Such collections bring very high prices. I know of one that fetched $2,200. As for most of the ancient bric-a-brac, it should be regarded with suspicion. Revolutionary teapots were once a leading article on account of the firing of the tea overboard. But I regret to say that the demand was broken up by an unprincipled dealer whose fraudulent methods knocked the life out of what was once a very salable article.

"Yes, personal relics are to be had. Genuine ones are rare. There are dealers, though, who will sell you anything you want from a Gen. Putman sword to the bull's-eye repeater of a delegate to the first Congress. These last articles are known to the trade as 'orphans.'

"Oh, don't speak to me about manufactories of our goods. It is most awful to think of. Yes, sir, I know two factories where its done. It's an insult to liberty."—*Jewelers' Circular.*

THE BREAKING OF SPRINGS.

Much has been said about the breaking of springs and their causes, but the subject remains ever new. A correspondent in a German newspaper gives the following views:

Every watch spring will finally arrive at the period when it will break. Repeated concussions will burst a cannon, break an axle, and cause the breakage of a rail. Caused by the unceasing bending to and fro, of a piece of metal, its cohesion will be destroyed, and it bursts or breaks. Since from the preceding it cannot be expected that watch springs are an exception, we may only consider what means will hasten or retard the final breakage. We may specify the following points:

1. Hardness and quality of the steel; 2. dimensions (measure); 3. treatment; 4. change of temperature; 5. crystalization, decarbonization, and electrical influences.

1. Steel is composed of iron and carbon. If we heat it in the fire for the purpose of hardening, the carbon endeavors to disengage itself. In this condition we suddenly plunge it into some cold fluid; the carbon crystalizes, penetrates the iron with its diamond-like molecules, and the steel becomes so hard as to cut glass. This is a practical reasonable theory, and undoubtedly the true one, since the microscope can substantiate it, and we will accept it for want of a better.

If we temper the steel blue, a retrograde chemical action takes place. The circumference of the steel increases a trifle, and it is, as it were, enveloped in an impenetrable coating, within which the molecules or atoms arrange themselves. This imparts the elasticity. When this extremely thin colored envelope is removed, a part of the elasticity is lost. Hence, a blue spring has more power of tension than a white one.

In accordance with the unequal disposition of the carbon in steel imperfections can be inherent in the spring, and an undue hardness is produced in any one or more of its parts. Such imperfections may also be engendered by an unequal heating, so as to disturb the local porportions of the carbon. Defects of this nature cannot be detected by the eye, and the watchmaker can only obviate the breakage of springs, due to such bad treatment, by using those of a recogniz ed good standard.

2. One proportion of spring dimension is preferable to the other. The use of a broad and weak spring is preferable to that of a narrow and strong, and by right proportions, the like power may had.

A thin steel at bending does not suffer a displacement of its atoms as much as a thick one, because the rounded side of the first is nearer, to its fulcrum, or the point around which it bends or moves. A thin piece of glass may be bent, while a thick one shatters with the least attempt. A recommendable proportion of the spring would be a gradual decrease of di mension of its coils, as they would more concentrically accommodate themselves around the core; this only applies to movements with fuzee; the best form for movements with toothed barrel is an equal thickness throughout its entire length.

2. When we wind a spring close around the core, we obtain more coils than it has when at rest against the barrel wall. The difference in the number gives us the revolutions which the spring will make when being wound.

If the space between spring and core is large, and we made use of its entire power, or, in other words, we do not use a fuzee and stopwork, the elasticity of the spring would be increased, also the danger of breaking, than if less room were at disposal.

The use of the whole unconfined spring power produces friction of its coilings by the tightened elasticity, destroys the colored lamina of the spring blade, and thus lessens its elasticity, the surface becomes porous, and inclines the spring to breaking.

Also the same defect is often produced by too strong a winding of the spring, both in movements with fuzee and in those with toothed barrel and stopwork. This is often done for the purpose of overcoming a cramping or friction in the movement, or some other error, a correction of which is very difficult, and it is sought by this means to conquer it by an increased power of spring; sometimes it is intended to produce the greatest possible balance vibration. This doubtful remedy is oftener the cause of a spring breaking than all the others taken together

The following is a right proportion of the spring: 14 coils (never less than 12) must lie within the spring barrel: the empty space between the spring and the

core must amount to fully one-third of the barrel diameter, and the core must always measure one-third; it should be fuzee form, and with the beginning of the first inner spring coil, be a complete circle, in order to impart as concentric a motion as possible. A protruding core hook is to be avoided, and that of the barrel must be kept as low as consistent. If all these conditions are complied with, the spring will make about six revolutions, if wound up to within $\frac{1}{2}$ or $\frac{3}{4}$ turn, and there is obtained for a toothed barrel, making four turns, a spring power in its best attainable proportion.

The French pendulum clockmakers have the senseless habit of making the spring arbor hook as projecting as possible, as if experimenting to find out how much the spring would resist. I can explain the proportionately few breakings of such springs only from the reason of their great breadth and thinness, which also protects them against an undue expansion, conjointly with the lubricating, gum like oil, which protects them against any injurious effects of friction in its coils. Finally is the careless treatment and the putting in of the spring with too small a core often the reason for a subsequent breaking.

4. If a spring in a barrel with stopwork, without making use of its duty, is wound to its utmost expansion, and the temperature would suddenly change from heat to cold, a sudden snapping, owing to the molecular change of the steel, would be inevitable; even if the spring were not wound to its utmost, a break may easily occur, because the condensation of the steel takes place suddenly, consequently a change in its outside molecular arrangement; it is well known that a hot lamp chimney will suddenly shatter when exposed to a cold air draught. A breaking of the spring consequently will occur most frequently in spring, fall and winter.

5. All metals subjected for any length of time to tension, crystalize, and exhibit an inclination to return to their previous crude condition. When this happens, they part with their cohesion by exhaustion, and a separation of the molecules takes place sooner or later, in due ratio with the sum of the tension to which they were subjected. Since steel, however, possesses greater cohesion than nearly any other metal, it would resist this natural law longer, if other powers did not combine to decarbonize and consequently to ruin it. The main factors producing this change are heat and electricity. One is permitted to say heat is electricity, and electricity is heat. Both expressions are synonymous. All metals contain latent heat and latent electricity, which may be excited by nature, by chemical influences, and by friction.

The main factor in an electric machine is a glass plate (isolator) on which by friction an electric current is generated. The same is produced by the friction of a hand on the watch crystal. If of steel, it will be partly destroyed at the point of contact, betrayed by the rust which is formed at this place. This rust is generated by electric heat. The friction of the coils of a watch spring against one another, also engenders electricity, especially in warm weather, when it is assisted by the peculiar condition of the air. The steel becomes decarbonized hereby, and thus is induced the unaccountable, mysterious breaking of the spring during hot weather. A balance spring hardened in fire suffers by its inelastic condition an inner friction of its molecules, hence the tardation of rate during very hot electric weather. Different individuals are better or worse conductors of electricity, hence the difference of the rate of one watch, when worn in succession by different persons. The more humidity a body absorbs, the better a conductor of electricity it is; whence a blue spring with closed parts is not as good a conductor as a white and porous one.

Galvanism, or Voltaic eletricity, is generated when two different metals touch each other, and one is influenced by an acid. A brass spring barrel with a steel spring and an oil containing acid together constitute a galvanic battery, set into action by heat. The less acid the oil contains, the less is the quantity generated, but sufficient to keep the spring slippery, and the less is the danger that free galvanism is developed; but the air often furnishes an acid (humidity) causing the battery to become active. Heat is produced by this, and the metal is ruined. If chronometers and watches did not contain so great an amount of brass, and consequently so active a conductor of eletricity, radiating it into space, it would perhaps be difficult, to even have a time measure with a balance spring. A marine chronometer is better protected than a watch, because surrounded by bad conductors, or good isolators; from the moment forward that a watch taken from a cold room comes in contact with the heat of the body, the electric current begins. Springs wrapped with brass wire and oiled with the common olive oil, become so vitreous in one or two years in the tropics that they break like g'ass. This is my own experience.

Those who wish to inform themselves farther on this point, I would recommend a study of generation of friction or galvanic electricity by steam engines.—*Jewelers' Circular.*

BUSINESS CHANGES FOR APRIL.

P. Taylor, jeweler, Oshawa, Ont., advertising his business for sale; Risden Bros., hardware, St. Thomas, Ont., have sold out; Johnston Bros., jewelers, Toronto, dissolved, Geo. T. Johnston continues; E. Rousseau, jeweler, London East, Ont., cleared out; Chas. McKenzie & Co., hardware, Sarnia, Ont., style now McKenzie, Milne & Co; Wiberg & Ashdown, hardware, Stonewall, Man., dissolved. Alf. Ashdow continues alone; M. R. Counter, jeweler, Seaforth, Ont., offers business for sale; Wm. Clegg, hardware, Blyth, Ont., sold out to Chas. Hamilton and removed to Brandon, Man.; E. Graver, hardware, Barrie, Ont., advertises business for sale; A. E. Kemp, hardware, Montreal, sold out to M. Philbin; L. Atkinson, jeweler, Newmarket, Ont., assigned in trust; J. F. Austin, fancy goods, Peterboro, Ont., sold out to C. B. Routley; John Egger, jeweler, Montreal, failed; D & L McIntyre, hardware, Lucknow, dissolved, David McIntyre continues; Jos. T. Cote, jeweler, Montreal, failed; R. J. Butler, jeweler, Ottawa, Ont., gone to Winnipeg.

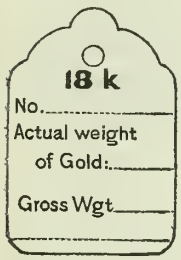
BUSINESS NOTES.

Mr. Henry Smith, of the firm of Smith & Fudger, sailed for England on Tuesday last.

A Sorel jeweler, by name of J. B. A. Darche, has left without notifying his creditors or settling his liabilities, which amount to $800 or $1,000.

Mr. R. H. Smith, the well-known saw manufacturer of St. Catharines, on the occasion of his return from Mexico, was entertained at a banquet by his employees.

Mr. W. G. H. Lowe, of the firm of Zimmerman, McNaught & Lowe, leaves for England and the European markets in about two weeks. His many friends in Canada will wish him *bon voyage* and a safe return.



We are sorry to learn that Mr. Culp, wholesale dealer in watch material in Toronto, was suddenly taken ill last week and compelled to lay up for a few days. He is now fully recovered and able to attend to business.

Mr. Fred. Morse, the well-known employee of Messrs. L. & M. Samuel & Benjamin, was presented with a handsome gold-headed cane on the occasion of his leaving the firm for the purpose of starting business in Winnipeg, Man.

A company has been formed for the purpose of manufacturing locomotives, railway cars, etc., to be known as the "Canada Iron Works Co." with works at Hochelaga and a capital of $250,000. Some prominent names are attached to the application for charter, we note among others Messrs. Jacques Grenier, A. A. Trottier, H. A. Hogel, L. H. Senecal, A. Davis.

WE BEG TO CALL THE ATTENTION OF THE TRADE to the well known quality and elegance of finish of our Gold Cases, guaranteed by us to be of eighteen karat Gold, U. S. Mint assay, or of fourteen karat Gold, as may be stamped, and also to our mode of selling the same, charging only for the ACTUAL WEIGHT *of the gold used, and not for the base metal comprised in springs, key pipes, filling of crown, etc. To illustrate which we here show copy of tag accompanying each one of our Gold Cases, which plainly indicates not only the gross weight of the Case, but also the* NET *weight of the gold.*

AMERICAN WATCH COMPANY,

ROBBINS & APPLETON,

New York, August 1st, 1881.

General Agents.

IN EXPLANATION OF THE ABOVE we desire to say that the old plan of charging for the gross weight of the case, as if it were all gold, worked well enough as long as the manufacturers were content with the amount of brass and steel actually required in its construction; but when the business was degraded into a contest as to who should get the most base metal into the least quantity of gold and call it a GOLD case, then the time came when, in the interest of dealers in American Watches, it became necessary to adopt a plan of selling, showing the buyer exactly how much GOLD each Case contained.

In adopting this method we act in conformity with the earnest wishes of the leading houses of the Trade, some of whom have already undertaken to carry out the same idea in their own business.

ROBBINS & APPLETON,

GENERAL AGENTS.

Mr. R. H. Moody, the well-known bankrupt stock dealer, has entered an action against one of the Winnipeg papers for alleged libel in reference to the Marcotte affair. The libel appears to consist in the fact that the paper in question published Marcotte's confession without comment.

The widow of the late Mr. Henry Mulholland, formerly a member of the insolvent hardware and iron firm of Mulholland & Baker, has presented a petition to the Insolvent Court claiming $95,000 out of the real estate of her husband under some old law, which it appears is still in force.

We had a call a few days ago from Mr. A. W. Thompson of Prince Arthur's Landing and Winnipeg. He reports prospects for business good in both places and thinks that when the C. P. R. is fairly running between Prince Arthur's Landing and Winnipeg it will make things hum in the former place. We think he is right.

We had the pleasure of a visit a few days ago from Mr. Daniel Stern, manager of the New York office of the Chicago *Watchmaker and Metalworker*. Mr. Stern's visit to Toronto was a mixture of business and pleasure, and he expressed himself as being highly pleased with the appearance of the "Queen City of the West."

Mr. M. R. Counter, jeweler, of Seaforth, Ont., is going to sell his business and purposes removing to Portage la Prairie, Manitoba. Mr. Counter has a fine trade and one of the handsomest and best fitted up jewelry stores in Canada, and any person with capital in want of a good opening in his line would do well to purchase his business. We wish him success in his new home.

John Egger, a small jeweler in Montreal, has failed owing to an accumulation of troubles. A partner he had who left him in January was a source of loss to him, since then he has been burnt out, and as he had only paid half his insurance premium the insurance company refuses to settle his claim. The landlord has seized the little balance of stock for rent, and he talks of calling his creditors together to see if some steps cannot be taken to recover his insurance.

Mr. James Robertson, of Montreal, is about to establish a branch of his lead and saw business at Winnipeg, where he has purchased a suitable lot and will proceed to build business premises. Mr. Robertson already has branches in Toronto and St. John, N. B., in Canada, as well as one in the United States at Baltimore. Mr. James Tees will have the management of the Winnipeg branch.

It is reported that the Minister of Customs is about to appoint a staff of special agents over the frontier and keep watch for smuggling operators who bring in contraband jewelry and other goods easily imported. These men will be much like the present American Customs agents, and are expected to be very efficient. It is not stated how they are to be paid, but they are expected to work on commission.

The Imperial Bank of Canada has opened branch offices at Winnipeg and Brandon. An agency has also been established at Portage la Prairie. It is also the intention of the Bank of Nova Scotia to share in the business of the North West. Mr. E. H. Taylor has secured offices in the Dundee block, Winnipeg, and will have charge of this bank there, we are told. The Merchants Bank of Canada opened an office in Brandon a short time ago. It had been previously represented in Winnipeg and Emerson.

The winding up of the insolvent estate of Della Torre & Co., carrying on business in this city and Montreal, furnishes another example of the way in which assets may be legally eaten up. The liabilities of this concern were $20,445, and the total proceeds realized from the sale of stock, etc., amounted to $3,218. Of this sum Lawyers' fees were $653, Assignee's and Inspector's claims reached the sum of $594, or together about forty per cent. of the total receipts. After all other expenses are paid the creditors will have the pleasure of receiving just *two* cents on every dollar of liabilities, or in all $408.

The failure of L. Atkinson, jeweler, of Newmarket, is another example of the reckless way in which credit is given in this country. Mr. Atkinson commenced business a few years ago without capital, and by hard work got a foot-hold and began to accumulate stock. With increased stock came increased credit, increased business and increased expenses, and, as if to crown the whole, he launched out into building a brick dwelling altogether too high-priced for his means. The result of this way of doing business could only have one termination, and that to call a meeting of his creditors and ask for their forbearance. This he did last Thursday.

Mr. Charles Ellis, representing the firm of P. W. Ellis & Co., met with what might have been a fatal accident about three weeks ago at London station by jumping from an express while going at full speed. Charley says he hardly knows how it happened, but he thinks that he turned at least fifty summersaults before he finally came to a full stop. He was stunned for a time but he soon pulled himself together and finished up the business which excited him to make his flying leap; he has, however, been confined to his house ever since on account of the bruises he then received. This practice of jumping off trains in motion is a most dangerous one, and if any person who wants to know all about it will apply to Charley they will get some good advice on the subject. He says he is done with that kind of performance for the future, and thinks he'll die soon enough without any effort at suicide in that direction.

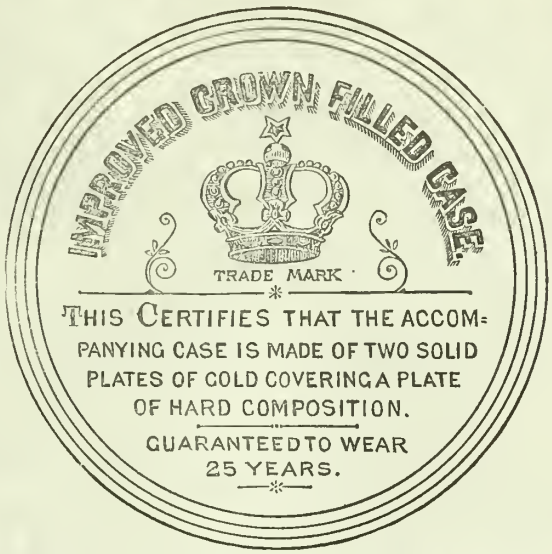
The many friends of Mr J. W. Jackson, jeweler of St. Catharines, Ont., will be pleased to learn that the U. S. authorities have honorably acquitted him of the charge of bigamy preferred against him. No one who knew him would for a moment believe that there was any truth in the charge, still it is gratifying for Mr. Jackson to know that his honor has been so amply vindicated. The only pity is that he should have been compelled to lose time and money in refuting a charge evidently preferred for blackmailing purposes. The following is a copy of the official decision in the case:—

"State of New York, }
County of Lincoln }

The People *vs.* James W. Jackson—There being no sufficient cause to believe the within named James W. Jackson guilty of the offence within mentioned, I order him to be discharged. Signed

H. H. Sheldon,
Justice of the Peace."

We have received a long communication from Mr. A. Brownley of Ailsa Craig, in reference to a paragraph which appeared in our business notes of last issue, regarding a charge of seduction preferred against him by certain parties residing in his vicinity. Mr. Brownley's letter, while evidently not intended for publication, is an explicit denial of the charges preferred against him, and, as we said in our former note regarding this case we must decline to believe him guilty until he has been clearly proven to be so. Mr. Brownley says that the whole story has been trumped up with the desire to ruin his reputation and business, but that it has failed to effect its object. As we said before we can scarcely believe that a man, who for forty years has borne an unblemished reputation, should suddenly have become the unprincipled villain his traducers seek to make him out, and we think that the public will be justified in holding him entirely innocent of the foul charge until his accusers have established its truth beyond a peradventure.



Death of Mr. Marcus Rossin.—Last mail brought intelligence of the death of Mr. Marcus Rossin, formerly a well-known and esteemed resident of this city, while on his way to Mayence to visit his daughter. Mr. Kleeman, on entering the train at Frankfort, found Mr. Rossin apparently asleep, with his book dropped on the floor. Mr. Rossin came to Canada in 1840, and after opening business in Kingston, removed with his two brothers to Toronto. Here under skillful and energetic management they built up a fine business, and ultimately opened a branch house in Montreal. In 1851 Mr. Rossin assisted in the organization of the Western Fire Insurance Company, and was one of the earliest directors. In 1854 he and his brother Samuel evidenced their public spirit by building what was then so greatly needed in this city, a really first-class hotel, which is known to this day by their name. After a while the Messrs. Rossin transferred their business to the late Mr. Robert Wilkes, who had learned his business in their warehouse. In 1865 Mr. Rossin decided to remove to Hamburg with his family, where he has since lived in retirement. He leaves a widow and two children, Canadians, both of whom have married and are well settled in Germany. The announcement of his death will be read with regret by his old friends in Toronto.

Our esteemed friend, Mr. Donald D. Manson, formerly of Toronto, but at present representing the Waltham Watch Co. in Australia and New Zealand, has lately been distinguishing himself by exploring *a la Stanley*, his feat consisting in making the ascent of the active volcano of Tongariro in New Zealand. This is the first instance in which the native Maoris have ever allowed any white man to ascend this mountain which they have hitherto regarded as sacred. On making the ascent, when at an altitude of 2,500 ft., it rained heavily, and was blowing a heavy gale from the south-west. On reaching a further altitude of 5,000 ft. a violent hail storm was experienced, and at 7,000 ft. it snowed heavily, and at the same time the wind was so violent that the party were compelled to throw themselves on the snow so as to prevent their being blown off their feet. Mr. Manson describes the crater as being about three-quarters of a mile in circumference, with a cave in the centre which was continually throwing boiling mud to the height of about 500

IMPROVED

The Watchmaker, Jeweller and Silversmith,

A Monthly Illustrated Journal. Published in London.

The Representative Organ of the Watch, Jewellery and Kindred Trades in the United Kingdom.

It is full of original information and thorough practical instruction contributed by the leading writers on the various subjects connected with the above trades. The text is well illustrated by wood-cuts, and two supplements of artistic designs for jewellery, etc. accompany each number.

This important Trade Organ, now in its seventh year of publication is in the hands of every British Watchmaker, Jeweller and Silversmith, and is therefore a most valuable medium for manufacturers requiring publicity in Great Britain.

Our list of permanent contributors includes such names as: J. U. Poole, Richard Whittaker, Henry Ganney, Moritz Grassmann, J. Herrmann, E. J. Watherston, W. H. Singer, an ample guarantee for the sterling value of the journal. Subscription 5s. per annum.

Published by A. FISCHER, 11 Saint Bride Street, London, E. C., England.

feet. The inside of the crater was studded with uumerous blow-holes, and a slight tremor of the grouud was occasionally felt. As it was too late to return Mr. Mansou was compelled to remain on the mountain all night without food or blankets and with very little clothing. The cold was intense, the thermometer registering several degrees below zero. About 2 a.m. the wiud abated and the moon rose, when a really magnificent sight was witnessed by Mr. Manson aud the guides. The upheaval of mud in the crater and the hissing noises all about are described by the party as being the most weird-like that could be imagiued. At daylight Mount Egmont could be plainly seen snow-capped. The ascent and decent, with the time Mr. Manson spent in the crater, occupied 21 hours. He has already made the ascent of the principle mountains in the world, includiug Kilawea, in the Sandwich Islands, and he says that Tangario far surpasses anything he has yet seen in its grandness and weird-like formation.

WORKSHOP NOTES.

Hold a cold chisel firmly to its cut without removing it at every blow. This will increase the effectiveness of the tool, and there will be less danger of breaking by a foul blow.

To fit a key: Smoke the blank over a candle, insert it in the keyhole and press it hard against the wards of the lock. The indentations in the smoked portions will show where to file.

A correspondent of the *Mechanical Engineer* says: "If any of your readers have occasion to weld cast steel let them try spent lime, air slacked and use it just the same as borax; they will find it will answer quite as well aud cost nothing.

Crucible steel is made by melting in a crucible either blister steel, or blister steel and wrought iron, or wrought iron and charcoal, or wrought iron and scrap steel, or, in short, a great variety of mixtures, which depend on the quality of steel to be produced.

Rust may often be removed from steel tools by immersing them in kerosene oil for a few days. This loosens the rust so that it may be rubbed off. Where the rust is not very deep seated emery paper will do, but if of long standing the tools must be refinished.

It has been proved by Mr. Waite's experiments that a highly polished bearing is more liable to friction than a surface finely lined by filing. The lines left by the file serve as reservoirs for the oil, while the high polish leaves no room for the particles between the metal surfaces.

The simplest and cleanest substance for cleaning silver articles is, according to Professor Davenport, hyposulphite of soda. It acts quickly, and is inexpensive. A rag or brush, moistened with a saturated solution of the salt will cleanse even strongly oxodized silver surfaces in a few seconds, without the application of any polishing powder.

To keep machinery from rusting, take one-half ounce of camphor, dissolve in one pound of melted lard, take off the scum and mix in as much fine black lead as will give it an iron color. Clean the machinery and smear with this mixture. After twenty-four hours rub clean with a soft linen cloth. It will keep clean for months under ordinary circumstances.

To harden steel take two teaspoonfuls of water, one-half teaspoonful of flour and one of salt. Heat the steel enough to coat it with the paste by immersing it iu the composition, after which heat it to a cherry red and plunge it into soft water. If properly done, the steel will come out with a beautiful white surface. Stub's files are said to be hardened in this manner.

A Brilliant black is produced on iron and steel by applyiug, with a fine hair brush, a mixture of turpentine and sulphur boiled together. When the turpentiue evaporates, there remains on the metal a thin lair of sulphur, which unites closely with the iron when heated for a time over a spirit or gas flame. This varnish protects the metal perfectly, and is quite durable.

The mode employed in blueiug steel is merely to subject it to heat. The dark blue is produced at a temperature of 600°. The steel must be finely polished on its surface, and then exposed to a uniform degree of heat. There are various ways of heating the article, e. g., over a flame producing no soot, by a hot irou or other heated metal, and by means of wood ashes. A very regular degree of heat is necessary, and wood ashes are often used for fiue work.

SCIENCE NOTES.

Shear steel is made by takiug a high heat on blister steel and hammering it thoroughly. Double shear steel is made by cutting up shear steel, piling it, heating it, then hammering again. The best shear steel is made from the best wrought iron. The shear steels are very useful on accouut of their toughness and the ease with which they can be wielded to iron, a d, when of good quality and well worked, they will hold a very fine edge.

A novel pair of scissors has been devised by Herr Sievert of Dresden. The blades are represented by two circular steel knives, which slightly overlap at the edges, and are pressed together by two spiral springs. The knives are fastened to a pair of woodeu rollers with India rubber rims, which grip and guide the cloth or paper as it passes between the knives, so that the latter may cut straight. These cutters are carried by two haudles or levers which are held in hand, aud the cutting is effected by pushing the scissors forward, so as to cause the rollers to revolve.

NICKEL
SHOW CASES FOR SALE.

In consequence of their Removal the undersigned have For Sale Very Cheap, Five First Class Nickel Show Cases, made by Millichamp, of Toronto. These Cases are square shaped, 12 feet long, 30 inches wide, and 20 inches deep, with Handsome Stained Stands. Are suitable for Fancy Goods or Silver Ware. Cases and Stands cost $116. Will be sold for $80 cash.

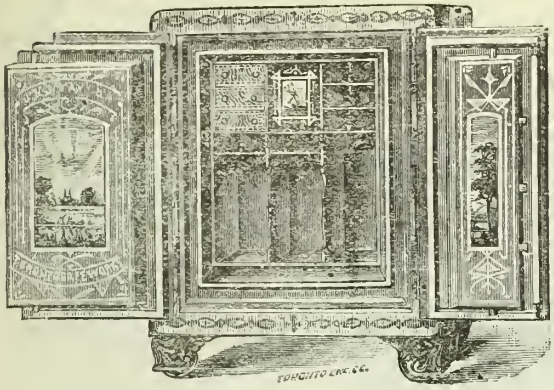
THE LARGEST
Clock House
IN CANADA.



I beg to direct the attention of the Trade to my large assortment of Clocks, from the following celebrated manufacturers, viz:
SETH THOMAS, WELCH,
GILBERT, AND ANSONIA,
INGRAHAM.

I keep these Clocks in every style now manufactured, and show 200 different varieties of samples, besides Regulators of all kinds.

I will sell, only to the Trade, any of the above makes of American Clocks at prices lower than any house in Canada, and will guarantee to meet any competition either in quality, style or price. Also a large variety of Ladies and Gent's Swiss Watches, Gold, Silver and Nickel Cases, Key and Stem winders.

SAMUEL STERN,

Sole Agents for SETH THOMAS' CLOCKS,
31 Wellington, 40 Front st. E., Toronto.

J. & J. TAYLOR,
TORONTO SAFE WORKS.

Patentees and sole manufacturers of Taylor's patent Fire proof Safes with

Non-Conducting Steel Flange Doors.

ALSO MANUFACTURERS OF

Burglar Proof Safes, Vaults, Vault Doors, Bank Locks, Combination Locks, Prison Locks and all Kinds of Fire & Burglar-Proof Securities.

Editorial.

THE OUTLOOK.

The Ontario Bureau of Agricultural Statistics has just issued its first report, which, on the whole, is highly satisfactory. It shows that, although we cannot look forward to the wonderful harvest of last year, a good average crop will reward the labors of our farmers. To a country like Canada, that depends for its prosperity mainly upon its agricultural resources, this is cheering news, for it indicates a prolongation of the good times that we have lately experienced. When crops are good the country is prosperous because the farmers are enabled to pay their debts and launch out into small extravagances that in hard times they would never dream of. This enables the merchants throughout the country to meet their bills with promptitude and gives an increased impetus to a thousand industries which would be otherwise depressed. The fact is that in a country like Canada the difference betweed good and bad times is simply the difference between a good and bad harvest. The outlook is promising, and it may be confidently predicted that the country is safe for another year.

AS USUAL.

As usual, party politics have proved stronger than national necessities, and consequently the bill for the rateable distribution of an insolvent's assets and many other equally good legislative measures have been consigned to the political limbo, or, in parliamentary language, "have received the six months' hoist." This is much to be regretted, not only because it argues ill for the country when necessary mercantile legislation is thrust aside to make way for such uncalled for legal monstrosities as the Re-distribution Bill, but because the non-passage of an insolvent act at the present juncture may very seriously cripple our mercantile interests.

It is now too late in the day for any one to attempt to controvert the broad principle which underlies all Insolvent Acts, viz.: that an insolvent's estate should be divided *pro rata* amongst all his creditors, and the truth of this being admitted, it follows as a matter of course that any law, or want of law, which will allow one creditor to take everything and allow the rest nothing, must be essentially unjust both in principle and practice. This injustice is freely admitted by politicians as well as mercantile men, and but for the exegencies of party politics, would have been legislated upon ere this. Party politics, however, have as usual overtopped every other consideration, and as a result, the country will for another year have to struggle against a condition of things highly prejudical to honest dealing. We have before had occasion to point out some of the evils connected with the want of a good insolvent act, and it would be superfluous to again go over the same ground. We may however in passing, say that every day brings to light new specimens of how easily a debtor can legally enrich himself at the expense of his creditors.

Shall this state of affairs continue? We hope not, for it is certainly for the best interests of both debtor and creditor to have some law by which an equitable division of an insolvent's estate could be made. Such a law would not only protect each class more fully in case of failure, but would help to strengthen the credit and standing of debtors, who would then be beyond the reach of personal malice and sudden panic.

The importance of this subject is becoming more apparent every day, and we trust that another year will not be allowed to pass over without some fair and comprehensive law being placed upon the statute book to meet the necessity.

THE ELECTIONS.

In spite of the many attempts to hoodwink the people, it has been for a long time apparent that the session just ended was to be the closing one of the present parliament of Canada. Even a blind man might have seen that the Re-distribution Bill meant nothing more nor less than the strongest party were getting themselves ready for the fray.

Now that parliament has been prorogued and further concealment is useless, the cat is finally allowed to come out of the bag, and the official announcement is made that the writs are to be issued on the 13th and the elections to take place on the 20th of the present month.

Now that the elections have been decided upon, it is just as well that they should be decided at once. Business will be sure to be at a standstill until they are settled, and the shorter the time for preparation the better for the country at large.

With the exception of a few pot-hunting politicians, people do not make any money out of politics, therefore the less time wasted upon it the better. As a rule, most people have already made up their minds how they will vote, and six months haranguing and canvassing would fail to make any decided change in them. This being the case, we think the sooner they are decided the better both for the country and for the candidates themselves.

The duty of every elector is now apparent, each one should weigh carefully the merits or demerits of both parties and cast their ballot according to their honest convictions. If they are satisfied with the general policy of the government then vote to sustain them in power; if on the contrary, they think that the government have abused the trust confided to them by the people, then they should vote to replace them by what they consider better men. In any case however, they should vote intelligently and as the result of their honest convictions and refuse to be led by the nose by political demagogues to whom these elections are simply a question of outs and ins.

No elector should shirk the vote; the franchise is the freeman's heritage, and a privilege not only to be proud of but one that should be exercised as a duty that each one owes to their country.

DO WE NEED A CANADIAN HOROLOGICAL SCHOOL?

Although Canada possesses a large number of good practical watchmakers, it also has a great number of very poor ones who are anything but a credit to their calling. We do not know of anything

that is more calculated to bring the craft into ill-repute than bad workmanship, and we think most of our readers will agree with us that anything that can be done to remedy this defect would be a very great benefit to the trade. We think it will be conceded that but little or nothing can be effected in the way of improvement among those bunglers who are at present living upon the gullability of the public, advertising themselves as "practical watchmakers." The reform, if we are to have any, will have to begin with the apprentices, and if the standard of workmanship and technical knowledge can be roused amongst them, we may hope in the near future to have more intelligent workmen and a better class of work. The cause for so many inferior workmen as we have at present is not far to seek; some are poor because, having picked up the trade without any assistance, they are almost ignorant of the first principles of horological science. They began, perhaps, by cleaning their father's clock or some antiquated watch, and having some aptitude for the work, finally developed into the full-fledged watchmaker that they now claim to be. This class, however, are not by any means the worst offenders, because as a rule they have aptitude and a love of the trade and only require competent instruction and supervision to make them first-class mechanics. The fact that some of our best practical workmen are self-taught is held by some to prove that the self-taught mechanics are by far the better craftsmen, but we think that these exceptions only serve to prove the rule, as they become good workmen not because of their disadvantages, but in spite of them. If these same workmen had possessed the advantage of competent instructors they would either have attained a greater excellence in their profession, or acquired their knowledge in a much shorter time than it cost them to master it.

But probably the larger number of these inferior workmen spring from the class that was regularly apprenticed to good masters. Sometimes the fault is that the apprentice has no aptitude for the business and it is only a waste of time for any boss to attempt to make a good watchmaker out of him.

When a boss finds that a boy has no genius for the trade he should try and induce him to give it up and get into something more congenial to his inclinations. There can be no greater mistake than the supposition that anyone has brains enough to become a watchmaker; the fact is that watchmaking is one of the most exact of sciences, and it requires a mechanic of more than ordinary ability to insure success in this line. This fact is often lost sight of by parents who resolve to make one of their children a watchmaker because it is an easy and genteel business, and taking no account whatever of the boy's natural inclinations and capabilities.

A larger class than this, however, consists of those over-smart boys who have such large mechanical capabilities that they can learn any trade so simple as watchmaking in a few months. By the time they are able to clean a clock properly and have tried their hands with some tolerable degree of success upon some half score of cheap watches they know as much as their boss and don't see why they should continue any longer as apprentices when they are really first-class workmen, capable of earning the highest rate of wages by doing any kind of work from the repairing of a repeater watch to the manufacture of a chronometer. The result is that they launch out for themselves just about the time they should begin to be useful apprentices, and the amount of botch work they succeed in turning out is ample proof that their genius is of too elevated a character for such an ordinary occupation as watchmaking.

We said at the commencement that it would be hardly possible to effect any improvement in this class. Although probably not too old to learn, they know too much, and instruction of any kind would be thrown away upon them. This being the case, we think the only way to effect any improvement is to commence work upon the new material that is coming forward, and by means of highly trained and skillful workmen, force the incompetent out of the business. The only practical way in which we think this could be effected would be by the establishment of a horological school for this country. As the discussion of this would take a lengthy article in itself, we will reserve it until another issue, and conclude by merely saying that, in our opinion, the scheme is practical and well worthy of the consideration of the trade.

Selected Matter.

A NEW PROPOSAL FOR A HOROLOGICAL SCHOOL.

Our old friend, Mr. Aristarchius Plumbago, whose scheme for organizing a new watch company for the manufacture of "the Great American Demagnetized Hydrostatic Time Annihilator," was published in these columns some months ago, and which, for magnitude of scope and benevolent intention, stood without a rival among the beneficent propositions of the day. His time Annihilators were to be made for less than cost, and were to clothe the naked, christianize the heathen, father the fatherless, husband the widow, and in every conceivable manner confer blessings upon the human race. Plumbago, although in a chronic state of impecuniousness, is the champion philanthropist of the age; he is a whole missionary society in himself, with an orphan asylum and a charity hospital thrown in. In his own estimation, Peter Cooper's philanthropic enterprises are but side-shows to his, while these benevolent persons who have endowed colleges and built churches have done little to earn the praises of the public compared to what he proposes. Measured by his estimation of himself, he is the great humanitarian of the times, but not being fully appreciated in this degenerate age, he is usually regarded as the veriest Pecksniff among Pecksniffs.

But, as we remarked, Plumbago is in town; being in town, he naturally called to see us. After he had showered greetings and blessings upon us, we asked how he was progressing with the manufacture of the Great American Demagnetized Hydrostatic Time Annihilator.

"Ah! my friend," said Plumbago, while oleaginous tears trickled down his venerable nose, "this is a world of disappointments. Vexation of Spirit and petty persecution are the lot of the pure philanthropist and the unselfishly benevolent. It is a singular and remarkable fact that the American public did not respond to my appeal for funds with which to establish that enterprise in that spirit of liberality in which it was entitled to be received. You will remember I showed you a list of subscriptions amounting to $100,000 or more, and stated that I had as much more promised. Alas! the result proved that the men who made those subscriptions were penniless adventurers, who gave their fictitious sub-

scriptions for the sole purpose of controlling the organization of the company, and electing themselves to the best offices. They had no money, but large expectations. As I had proposed, as the inventor of the scheme, to be president, secretary, treasurer and general manager of the company, their views were incompatible with mine, and the company was never brought into being. The only money we received was $25, subscribed by an enthusiastic but extremely verdant country dealer. Those reckless adventurers insisted that I should divide that among them, but I refused, and reserved the amount to defray my own expenses. It cost me a front tooth and a discolored eye to retain that sacred trust fund, but I am thankful that my physical strength defeated the avaricious greed of those ungodly mockers of christian benevolence."

We commiserated Plumbago on the lack of appreciation bestowed upon him by a cold and unappreciative world, and asked him what he had been doing since the collapse of his watch company scheme, and what were his plans for the future.

"Well, I assure you, the world looked dark to me when my pet scheme proved a failure," replied Plumbago, "and I thought to retire from the hollow and deceiving world and become an Indian agent, but the administration at Washington declined to appoint me, owing to the bigotry and selfishness of certain religious advisers who surrounded the President at that time. The President was impressed with my personal appearance, but was vulgar and unkind enough to suggest that the inflamed appearance of my nose, the result of erysipelas, was due to other causes. My feelings were so lacerated that I left him in disgust, sorrowing over the insincerity and unchristian spirit to be found in high places. I next resolved to connect myself, as secretary or treasurer, with some of those benevolent societies organized by the different trades for relieving the distress of the orphans and widows of deceased members. I have understood that the officers of some of these societies had the handling of large sums of money, and I thought to make one of them cater to the demands of my carnal nature in exchange for my spiritual counsel and advice. But I found on inquiry that the offices of these societies were already filled by self-seekers who were making a worldly profit by their apparent benevolence, and there was no place for me. In vain I worked up combinations to displace some of these men, that true philanthropy, as personified in me, might usurp their places, but in vain. The only reward I recived for my labors was the scoffs and gibes of the unthinking, and an attack in a scurrilous newspaper, wherein I was designated as a 'gerrymandering dead beat,' a worldly phrase, as I am informed, highly uncomplimentary. I then engaged in the field of religious journalism, but because of some severe strictures I made upon an ungodly banker who did not advertise in my paper, I was persecuted for libel, and while undergoing the incarceration ordered by an unappreciative judge, my paper suspended for lack of that moral and literary pabulum I was in the habit of furnishing.

"It is a sad world, my friend, and we who are endowed with superior intellects, philanthropical instincts and empty purses are subjected to many and great vicissitudes. But I have now matured a scheme that is sure to be successful, and to win for me that fame and those pecuniary emoluments for which my soul has sighed so long and so vainly. The idea itself I derived primarily from The Circular, but the development of its details, the expansion of the primative thought to a magnificent conception, and its application to my own peculiar characteristics and necessities, is all mine—the result of the daily and nightly cogitation of this massive intellect. I learned from your columns that the great need of the watch jewelry trade to-day is a Horological School, where the principles of horology and their mechanical application shall be taught. Thus much I learned from you, but my experience taught me that the mechanics and artisans of to-day, and the youths who desire to become such, are walking in the devious paths of poverty. The highest acquirements of the human mind are impossible to one who suffers mental distress through the medium of a collapsed pocketbook. Neither is man susceptible of mental culture when he is oppressed with anxiety as to the future of his wife of his bosom and the children of his loins. Therefore I have conceived the brilliant idea of combining a horological school with a trade benefit society. I have already sent out prospectuses to the trade, and complimentary notices of the undertaking have appeared in several papers. The title I have selected for this enterprise I consider to be a stroke of genius. It is, 'The Excelsior Academy of Horological Science and Applied Art in Jewelry, and the Horologists' and Jewelers' Vade Mecum Contributive Benevolent Institution.' The title is rather long for rapid pronunciation, but it looks well in advertisements and letter heads. This is to be a stock company, and none but persons connected with the watch and jewelry trade will be permitted to buy shares unless they desire to. The capital stock is fixed at $1,000,000, in $100 shares, of which $1 is to be paid in when the stock is subscribed for and the remainder in $1 instalments as called for by the president. I am to be president; also secretary, treasurer and general manager of the institution, as well as instructor in the various branches that will be taught. There is no doubt but that the trade will greedily seize upon this idea and send in their subscriptions. The establishment is to be located at Chicago, now the centre of the earth as well as of civilization, culture and refinement; from this great centre radiates all that is worth knowing of this life or the life to come. An enterprising publisher of that city has already placed a fourth story loft at my disposal, in consideration of which I gave him favorable mention in my circulars. I propose to teach there the entire science of horology and all that is desirable to know regarding the art of making jewelry. Watchmakers can come to me and perfect themselves in the knowledge of the art, and young men will be taught everything connected with the jewelry trade and watchmaking for the modest sum of $5 a month. It doesn't matter that I don't know anything about the business; there are lots of elementary works on the subject which I can re-write in the form of lectures. Then I expect manufacturers to furnish the Academy gratuitously with machinery and appliances. In a month or so I expect this great institution of scientific and artistic training to be in excellent working order. The benevolent branch of this concern will, no doubt, prove the most profitable. In the prospectuses I promise to day $1,000 to the widow and children of any contributor or subscriber to the institution, and in case of the sickness of any member I promise $20 a week. This looks well on paper, and will unquestionably bring many subscriptions to the stock of the institution. Of course, as I am to run the whole affair,

my compensation will have to be liberal; the tuition fee will naturally come to me, and I can also disburse the fund subscribed for stock. I shall not be required to make any report of receipts and disbursements, and shall not be accountable to anyone. I have provided for this in the constitution and by-laws. In fact I regard the constitution and by-laws as something unique and original. They provide that a board of directors shall be elected by the charter members; I am the charter members, having used the names of three or four friends for this purpose; the board of directors elect the officers, and I am chosen president, secretary, treasurer and general manager. It is provided that when this is done the board of directors shall be superseded by the officers, that's me, and all reports of officers (that's me) are to be made to the board of directors (that's me). This prevents all impertinent intermeddling on the part of stockholders. If any of these complain or ask how their money is being used, I will reply that the institution is necessarily costly, but it should be sufficient for them to know that they have been allowed the distinguished honor of helping to maintain an Academy of such character and influence. This scheme I regard as the greatest effort of my life, and one calculated to bring to me that ease and comfort that I have so long pined for. Of course, we shall have a newspaper connected with the Academy for circulation in the trade, and as I shall be the editor of it, its influence will be thrown in favor of the Academy, and the trade can always be assured of receiving glowing accounts of its success. The trade will, pay liberally for advertising in such a paper, and this will be another source of revenue. My circulars were sent out last week, and favorable responses begin to come in already. Yesterday I received $1 for subscription to the stock, and this I shall invest at once in a few beer glasses to furnish the Academy with. In short, this great education institution may be considered as open for business. I return to Chicago to-night, to enter upon my duties as Professor of Horology and Kindred Arts, and custodian of all funds contributed towards the founding and maintenance of The Excesior Academy of Horological Science and Applied Art in Jewelry, and the Horologists' and Jewelers' Vade Mecum Contributive Benevolent Institution. From time to time I shall address you from that city, and keep you informed as to my public and private enterprises."

With these words Aristarchius Plumbago, the great philanthropist and modern humanitarian, smiled benignantly upon us, and took his departure, first having secured a small loan to enable him to keep an appointment with a pawnbroker. —*Jewelers' Circular.*

BURNISHING.

By burnishing, the roughness of an object is flattened down until the surface is smooth and polished like a looking glass. Burnishing is an important operation for electro deposits, which consists of a multitude of small crystals, with intervals between them, and with facets reflecting the light in every direction. The deposited metal is hardened and forced into the pores of the underlying metal, and the durability is thus increased to such an extent that, with the same amount of silver, a burnished article will last twice as long as one which has not been so treated. The instrument employed for burnishing are made of different materials, and must be of great hardness and a perfect polish. Such are hardened cast steel, agate, flint, and bloodstone. For metallic electro deposits steel and blood stone are especially employed. There are several qualities of blood stone; its grain should be close, hard, and without seams or veins; it should leave no white lines on the burnished parts, nor take off any metal, and its color should be of an intense black red. The steel must be fine and close grained and perfectly polished Should the polish of any burnishing tool alter by use, it is restored by friction upon a skin or leather attached to a wooden block, which is fixed to the bench. The leather is covered with polishing rouge impalpable powder, or, preferably, with pure alumina, obtained by calcining ammonia alum in a forge fire. Venetian tripoli, rotten stone, tin putty, emery, or many other hard substances finely powdered may be employed. The burnishing tools are of various shapes, such as a lance, a tooth, a knife a half sphere, or a dog's tongue, and a considerable stock is necessary. The burnishing is divided into two distinct operations. The first consists in roughing, and the second in finishing. The tools for the first have a sharp edge, while for the second operation they have a rounded surface. The tools for the hand or the lathe are fixed by copper ferrules into short round wooden handles, so that the hand is not influenced by their weight. The tools for the arm or vise are fastened to wooden handles sufficiently long to rest their slender part upon the arm or shoulder. The stouter lower portion is grasped by the hand. The burnishing tools and the objects must be frequently wetted by certain solutions some of which facilitate the sliding of the instrument, or with others which have a chemical action upon the shade of the burnished articles. Of the first are pure water, solutions of soap, decoctions of linseed, and infusions of the roots of marsh mallow or licorice. The second includes wineless, cream of tartar, vinegar, alum in water. When burnishing gold applied upon electro deposits of copper, as is gilding with a dead luster by that method, use pure water, for fear of producing a disagreeable red shade. A solution of green soap is sometimes preferred by operators, although when old, it imparts an unpleasant tinge, owing to the sulphides of the liquor. When the burnishing is completed, the surface is wiped longitudinally with a soft and old calico rag. The polish obtained by burnishing is called black when it reflects the rays like a mirror, and should the presence of mercury or a bad deposit pravent the tool from producing a bright surface, the object is said to be greasy. Articles which have been previously polished, and which generally receive a very trifling deposit, are not burnished, but rubbed with chamois leather and the best polishing rouge. Too thick or too rapid electro deposits cannot be burnished, but must be polished by rubbing with a leather and a mixture of oil and powdered pumice stone, tripoli, or tin putty. Coarse powders are used at the beginning, and impalpable ones at the end of the operation. Polish silver deposits are more agreeable to the eye than burnished ones, but the hardening of the latter renders them more durable.

HOW MOSAICS ARE MADE.

It is said that in a portrait of Pope Pius V. there are 1,700,000 pieces, each no larger than a grain of millet. The enamel is a kind of glass, colored with metallic oxides, and it is so fusible that it can be drawn out into threads, small

rods, or oblong sticks of varying degrees of fineness, slightly resembling the type used by compositors. These polychromatic rods are kept in drawers properly numbered, so that the artist always knows to which case to repair when he requires a fresh supply of a particular tint or tints. When the picture is commenced the first step is to place on the easel a slab of marble, copper, or slate, of the size fixed upon; and this slab is hollowed out to a depth of three and a half inches, leaving a flat border all round, which will be on a level with the completed mosaic. The excavated slab is intersected by transverse grooves or channels, so as to hold more tenaciously the cement in which the mounts of enamel will be embedded. Then the hollowed slab is filled with "gesso" or plaster-of-Paris, on which the proposed design is accurately traced in outline, and usually in pen and ink.

The artist then proceeds to scoop out a small portion sf the plaster with a little sharp tool. He fills up the cavity thus made with wet cement or "mastic" and into this he successively thrusts the "spiculæ," or the "tesseræ," as the case may be, according to the pattern at his side. In the broad folds of drapery, or in the even shadows of a background, or a clear sky, his morsels of enamel may be as large as one of a pair of dice; in the details of lips, or eyes, or hair, or foliage, or flowers, the bits of glass may be no larger than pins' heads. The cement, or mastic, is made of slaked lime, finely-powdered Tiburtine marble, and linseed oil, and when thoroughly dry, is as hard as flint. Sometimes the mastic which fills the cavity is smoothed and painted in fresco with an exact replica of the pattern, and into this the bits of glass are driven, according to tint, by means of a small wooden mallet. If the effect produced wounds the artist's eye, he can easily amend the defect by withdrawing the offending piece of enamel and driving in another while the cement is still wet; and, by observing proper precautions, it can be kept damp for more than a fortnight. When the work is completed any tiny crevices which may remain are carefully plugged or "stopped" with pounded marble, or with enamel mixed with wax, and the entire surface of the picture is then ground down to a perfect plane, and finally polished with putty and oil. Byzantine may be broadly distinguished from Roman mosaic by the circumstances of the surface of the former being left unground and unpolished—save were there is burnished gold—thus leaving an irregularity of surface productive of great vigor of effect. A virtuous picture of the Byzantine style can at once be recognized as a mosaic, even if it be hung at an altitude of one hundred feet from the ground; but a perfected mosaic picture, after the Roman manner, might easily be mistaken, even at a very short distance, for a very elaborately finished and highly varnished painting in oils.—*London Telegraph*.

BORROWED JEWELS.

A writer in *All the Year Round* says: "Turkish ladies are at least as extravagant as their European sisters, and even more thoughtless than the most foolish of them. In these times of the decadence the majority have parted with their gems and finery, and when a marriage takes place, a feast, or what not, they hire valuables for the ceremony at monstrous interest. Some twelve months since the system, and the abuses it necessarily carries, were displayed in a famous case. Hairie Hanoum, wife of Mizhet Effendi, ex defterdar of the villayet of Broussa, was charged with obtaining money and jewels under false pretenses. Occupying a good house, where she dispensed a princely hospitality, she made it a business to hire valuables from the female dealers, which she immediately pledged in the bazar; or she hired in the bazar and pledged in the harem. Sometimes the jewels were needed to deck herself and her slaves at a grand ceremony; sometimes she pretended a visit to the imperial princesses. The prisoner also borrowed articles from people of the first rank, such as the wives of Essad and Huesin Beys, the daughters of the governor-general of the villayet of Hedjaz, and even from the daughter of Muchir Safvet Pasha. The important element of this detail is her emphatic declaration that all these great ladies either took money in the shape of interest, or actually 'stood in' with her, receiving a proportion of the sums for which she dames immediately repledged the objects which Hairie Hanoum pledged with them. The lady carried on her little game for many months, redeeming some pledged their ornaments. In particular she alleged that the family of Muchir Safvet made a regular business of hiring out their jewels when he was from home. These statements, of course, were vehemently denied, and the judges appear to have past them over with as brief notice as possible. As for the transactions with regular female brokers, they prove to be a maze of in-and-in dealing. These articles by the cash obtained upon newer loans. But the enormons interest finally swamped her. At the moment of arrest she was found in possession of five diadems, thirty-six jeweled plaques of medallions, eight aigrettes of brilliants, one gold watch and chain, two half diadems, seven pairs of brilliant ear-rings, three jeweled lockets, one bracelet, six diamond pins, five valuable rings, four brooches in brilliants or rose diamonds, one bouquet with jeweled leaves of flowers, one brilliant crescent, two valuable ancient robes. The whole was set down at over £5,000 Turkish—about £4,500. Hairie Hanoum was convicted. I forget her sentence. But the foolish system which encourages a swindle like hers is unchecked. In the lower ranks of life it produces every form of immorality, as a sensible man of the world needs not to be assured."

THE GOOD OLD TIMES.

The complaint that money will not go so far in our generation as it did a generation ago, is frequent enough, although the compensating truth that money on the whole, is made more quickly nowadays than it was formerly, is not so frequently dwelt upon. The general sinking of the value of money was most instructively and pleasantly illustrated in a paper read by M. Avenel a few days ago, in Paris, before the Academy of Sciences. His subject was confined to the period of Louis XIII.—1610 to 1643. A tolerably brilliant housekeeping, with ten servants, could be easily managed, as M. Avenel tells us, upon a yearly income of 12,000 francs. This is proved by the account books of Cardinal Richelieu's niece, Madame de Pont Courbay, who had exactly that income, and maintained herself, her two daughters, and no fewer than sixteen servants in the style corresponding to the high place and power of her eminent kinsman.

A nobleman with a revenue of 100,000 francs was held to be amazingly wealthy.

This was the *appanage*, M. Avenel says, of Gaston the King's brother, and also of the Duc de Rohan. The Constable de Montmorencie, the richest nobleman in France, gave his daughter only 300,000 francs as her dowry. Queen Henrietta Maria, the wife of Charles I., only brought about 300,000 francs into her English home as her wedding grant. The rents of the most splendid houses in Paris were extraordinary low—measured by the scale of two centuries later. Then the English Ambassador in Paris only paid 2,000 francs a year for the hire of his imposing hotel.—*Exchange.*

BUSINESS CHANGES FOR JUNE.

Anderson, A. C., & Co., Hamilton, dissolved, Dr. Dillabough withdrawing, A. C. & W. Anderson continue under old style; Boyd, Watson & Co., London, Fancy Goods, dissolved, business continued by Watson, Young & Co.; E. Maycock, Winnipeg, stock slightly damaged by removal and water; Jno. Scanlan, Bridgen, Hardware, removed to Forest; W. C. Fox & Co., Toronto, Jewelry, Bailiff in possession on Landlord's warrant; C. A. Davidson, Watford, Watchmaker, sold out; R. Wilkinson, Toronto, Stationer, sold out to J. S. Robertson & Bro.; Chinie Bro., & Lynch, Palmerston, Hardware, dissolved, Wm. Lynch continues alone; Elliot & Knott, Palmerston, Hardware, dissolved. Ellliot retiring, style now Lurs, Knott & Co.; W. A, Bnnghurt, Deleware, Furs, has removed to Oil City; Moodie, H. R. & Co., Winnipeg, Fancy Goods and Auctioneers, stock sold by Sheriff.

BUSINESS NOTES.

The jewelry store of T. G. Lowe & Co., in Windsor, was entered on Saturday night, and a large amount of jewelry taken.

Mr. W. G. H. Lowe, of the firm of Zimmerman, McNaught & Lowe, sailed for Europe, via New York, by the White Star steamer "Adriatic." He expects to return about the middle of July with the choicest novelties in jewelry that the English and Continental markets can supply.

Mr. A. C. Anderson, of the firm of A. C. Anderson & Co., of Hamilton, sailed for England last week on business for his firm. We wish him a prosperous trip.

Senex, British Columbia.—Your letter just received as we go to press, too late for this number. Will appear in next. Pleased to hear from you—come again.

An advertisement reads; "Wanted—A young man to be partly out-door and partly behind the counter:" and the *Cleveland Leader* asks, "What will be the result when the door slams?"

We regret to learn that Mr. W. F. Carrier, of the firm of Carrier & Marshall of this city, has been laid up with a severe attack of erysipelas in the head. His many friends in the country will be glad to hear that he is rapidly recovering, and expects soon to be about again.

A certain Chicago vessel captain was complaining recently that he had invested some money on 'Change and lost it all. A sympathizing ship-chandler asked him whether he had been a "bull" or "bear" to which he replied; "Neither, I was a jackass."

Mr. Samuel Stern sails this week for Germany, on his annual buying expedition. As usual he will ransack the Continental markets for anything new in fancy goods and clocks, and his customers may depend on his being as far to the front this season as usual in his special lines. —A pleasant trip Samuel.

We were pleased to receive a visit the other day from our esteemed friend, A. H. Doran, of Emerson, Manitoba, who was passing through Toronto on his way to his home in the Gateway City. Mr. Doran thought that while the water was subsiding in Emerson, he would visit Ontario and take unto himself a partner; this he accomplished successfully, and we had the pleasure of offering the newly married pair our congratulations.

A Montreal dealer in paiuts, &c, one B. B. Deacon, has failed, and is offering his creditors fifty cents on the dollar, but they demur, believing the estate could realize much more. He owes $5,000, and shows business assets of about $4,000, besides which he owns real estate that he values at $8,500, mortgaged for $7,500. The creditors think the real estate worth more than the price put upon it by Mr. Deacon, and are getting it revalued. The attempt to carry on two stores, and over investment in property are the cause of his troubles.

In reference to the letter signed "Reader" sent us about ten days ago, we cannot possibly publish such a communication. "Reader's" best plan would be to put his case in the hands of a good lawyer, if so, we think he could recover, as we believe the party he refers to is now in business in Hamilton. We are down on swindlers and dead beats of all descriptions, and shall always be ready to aid in exposing them, but we cannot publish anonymous communications, in all cases we must have the authors real name and address as a guarantee of good faith. If "Reader" will communicate with us by letter, we shall be happy to assist him.

A grocer in St. Catharines has hit upon a novel plan by which to collect bad debts. So soon as a customer becomes dilatory in payment of grocery bills, and shows indisposition to settle, the grocer sends round a boy with a big bell. The boy stops in front of the delinquent's residence and rings the bell vigorously. He is soon told to go away, but never takes the hint until the discovery is made that it is the grocer's boy "who has come to stay" and to keep up the infernal clang of his bell. "The result has been, so far, says the *Journal*, in every case that the debtor has come in a very indignaut frame of mind and settled up. He don't want the neighbors to get the idea that the ringing of the bell means a bailiff sale going on in the house." It may possibly be found, however, that the customer so dunned may get even with his tormenter by taking proceedings against him for creating a nuisance by his bell-ringing. Even slow-paying purchasers, provoking as they often are, have rights, and we suspect that one of them is that of protection from any such ear-splitting insults as those described.

The Montreal detectives are engaged in trying to find the perpetrator of an extensive robbery that took place a few days ago in the establishment of Louis Albert, a pawnbroker doing business in Notre Dame street. The total loss is about $5,000 in money and valuable goods. About seven o'clock in the morning a grandson of the proprietor, who is accustomed to open the store, found the front door open and the key in the door. He at once gave the alarm, and after a short search it was found that the safe had also been opened with a key, and about $1,600 in cash, and about $2,000 or $3,000 worth of goods, consisting of diamonds and other precious stones, rings, watches, chains, and other articles of jewelry, stolen. Further investigation showed that the robbery had been perpetrated by some one who was well acquainted with the premises; and suspicion at once fell upon a member of the family living in the house. The party suspected is under surveillance, but no arrests have yet been made. Another warning as to the utter worthlessness of key-lockins safes. Will it do any good.

The case of E Freudeuberg, jeweler of Ottawa who mysteriously disappeared some months ago, is at present attracting considerable attention on account of the action of Messrs. P. W. Ellis & Co., Wholesale Jewelers of this city. This firm finding that Freudenberg had dissappeared, taking with him all his available funds and some of his stock, attached the balance of his stock as security for their account. After being absent some three months Freudenberg returned, and finding Messrs. Ellis & Co, in possession commence an action against them for unjust attachment of his stock, stating that he had only been home to Holland on a visit. The first case was decided in favor of Messrs. Ellis, after which Freudenberg carried it to a higher court. Judgment in this appeal was given last weak, the Master in Chancery decided that the Messrs. Ellis, were perfectly justified in their action. It seems very strange that any merchant should dissappear so strangely that even his wife did not know of his whereabouts, and still try to set up the plea that he had only been visiting his native place on pleasure. If he had so intended he should at least have notified his creditors and made some provision for the accounts maturing during his absence.

The warerooms of Lee & Chillas, wholesale jewellers, are situated in the Royal Insurance buildings, corner of Wellington and Yonge streets. They open off the general hallway on Wellington street, and consist of one large and one small room. From the former to the latter there are two entrances—one from in front of the counter, and the other from behind. On Thursday last, Mr. Lee was sitting alone in this smaller room making up the deposit for the day, when two men came in and asked him if they could see some gold chains. Mr. Lee enquired if they were in the business, explaining that his firm sold to the trade only. They replied that they were in business in Ottawa. Mr. Lee then rose, passed through the door into the larger room, and stood

14 AND 18 KARAT GOLD WATCH CASES,

MANUFACTURED BY

THE AMERICAN WATCH CO.,

OF WALTHAM, MASS.

All Cases of our Manufacture are Stamped A. W. CO. which indicates that they are manufactured by the American Watch Company.

We are informed that cases are offered to the trade stamped W. W. Co. This is evidently done with the intention to deceive and further the sale of inferior cases. There is no Waltham Watch Co., but the name is used by us as a registered trade mark on a well known grade of movement.

AMERICAN WATCH CO.,

ROBBINS & APPLETON, - General Agents,

NEW YORK.

behind the counter. When he got behind the counter, the strangers were just coming out of the other door, one about a yard behind the the other. Some chains were produced, and while the strangers were examining them and asking the prices a customer came in, and the supposed jewellers said they would call again. Mr. Lee then became engaged with the customer. After transacting business with him he returned to his private office, and at once saw that his intended deposit had disappeared. The whole amount was $800, $275 of which was in cash and the remainder in cheques. Payment of the latter was stopped, and the police notified of the robbery. Just as we go to press we learn that three men, supposed to be the thieves, have been arrested at Kingston and brought to Toronto. Mr. Lee has identified two of them as the parties who wanted to see the gold chains at the time the money was stolen, and the magistrate has remanded them for one week, refusing bail.

WORKSHOP NOTES.

Powder for Silvering.—To 16 parts melted tin add an equal quantity of mercury, rub it well together, and with it mix 125 parts prepared hartshorn. Any metal rubbed with this will take the appearance of silver.

An Excellent German silver is prepared by melting in a crucible 55 parts copper, 23 nickel, 17 zinc, 3 iron and 2 tin. This composition is in every respect equal to silver in appearance, fully as hard, and not vitreous.

Articles which do not require much handling, may be quickly gilt without battery as follows: 1 part of chloride of gold and 4 parts cyanide of potash are dissolved in boiling distilled water, and the gilding fluid is ready; the articles are hung into this hot solution tied by a fine copper wire to a strip of zinc, scratched clean, left in it for a few minutes, and they will be handsomely gilt.

Cement for Glass and Metal.—Every one who uses brass letters on glass windows, and knows how often they tumble off from unequal expansion, or from the too energetic efforts of window-cleaners, will be glad to have the following receipt: Litharge, 2 parts; white lead, 1 part; boiled linseed oil, 3 parts; gum opal, 1 part. Mix just before using. This is said to form a quick-drying and secure cement.

Alloy for from 8 to 18 Karat Gold.—6 karat: 6 parts fine gold, 6 fine silver, 12 copper; 8 karat: 6 fine gold, 5⅓ fine silver, 10⅔ copper; 10 karat: 10 fine gold, 4⅔ fine silver, 9⅓ copper; 12 karat: 12 fine gold, 4 fine silver, 8 copper; 14 karat: 14 fine gold, 3⅓ fine silver, 6⅔ copper; 16 karat: 16 fine gold, 2⅔ fine silver, 5⅓ copper; 18 karat: 18 fine gold, 2 fine silver, 4 copper.

To Harden Steel Tools.—The practice is common among the engravers and watchmakers of Germany of hardening their tools in scaling wax. The tool is heated to whiteness and plunged into the wax, withdrawn after an instant and plunged again, the process being repeated until the steel is too cold to enter the wax. The advantages claimed for this method are that the steel becomes almost as hard as the diamond, and when touched with a little oil or turpentine, the tools are superior for engraving, and also for piercing the hardest metals.

To Clean casts of gypsum (plaster of Paris) bas reliefs, etc., which has stood for a long time and become dirty and dusty, several methods are employed, all of which, however, tend to injure the sharp corners of the cast, and occasion loss of time. The writer was called upon to do much of this work, and he hit upon the following excellent expedient: Boil of starch a thick paste, and spread it over the article to be cleaned, with a soft brush. Expose it to an airy place, and when dry, the paste will peel off, together with all the dirt and dust, and the cast will appear as white as when new.

Gilding Steel.—Polished steel may be beautifully gilded by the means of the ethereal solution of gold. Dissolve pure gold in *aqua regia*, evaporate gently to dryness so as to drive off the superflous acid, re-dissolve in water, and add three times its bulk of sulphuric ether. Allow it to stand 24 hours in a stopped bottle, and the ethereal solution of gold will float on top. Polished steel dipped in this is at once beautifully gilded, and by tracing patterns on the surface of the metal with any kind of varnish, beautiful devices in plain metal and gilt will be produced. For other metals the electric process is best.

To Temper Circular Saws and Thin Steel Discs.—Thin steel plates can be well and evenly tempered, by slowly heating them until red-hot in a wood fire, kept bright with the bellows. Two metal sheets or plates of a larger size than the steel must be lying ready, on one of which cold water has just been poured. Transfer the red-hot steel plate from the fire to the wet plate, and an assistant must be ready to lay the second plate immediately on top of the steel.

To Protect Metal Wares.—Polished articles of iron, steel, bronze or brass, are best protected against rust or dimming by polishing them with joiner polish and linseed oil, in the same manner as joiners polish wood. This precedure is adapted for all manner of highly polished metal wares, and especially for piano strings. The knack is easily learned. If a little saffron is added for brass, it will receive a gold like appearance. This must not be mistaken for the common way of "varnishing," by means of a brush. The inequality of such a coating is always disagreeable to the eye, while the other manner cannot even be recognized by expert eyes.

The Favorite black tone, the so-called oxidizing on silver, is produced in different ways, either with chlorine or sulphur. The latter gives a bluish black, the former a brown tone. If a deeper black is desired upon the finished article, either of silver, bronze, brass or copper, and silver plated, I use spulburet of potash (liver of sulphur), which I dissolve in distilled water and warm a little; if the tone is desired to be more of a brown, I use sal ammoniac and sulphate of iron in equal parts, dissolve in vinegar. But the easiest method, and sufficient for common demands, is to rub the article to be colored with sal ammoniac, and the black color is immediaely produced. Should a larger surface become spotted, or uneven in color, brush it with graphite. Mr. Kamarsh says, in order to coat silverware with a dark gray color, and to produce the so-called oxidized silver, immerse the manufactured and polished article in a very weak solution of sulphuret of potash and water, to which add a little sal ammoniac; when the desired color is produced, rinse in clean water, dry and finish by polishing, which with sufficient care, may be done. The thus produced gray color forms a very pleasing contrast for articles which are partly gold or gilt.

To Make Crocus.—Take sulphate of iron in quantity to suit, break it into small pieces, and put into a clean iron heating-pan, which place upon a gentle coal fire. The sulphate will soon become fluid, and part with its water of crystalization, but become dry little by little. It thus loses its green transparent color, but will turn into a whitish opaque mass. Now increase the heat under the pan, and constantly stir the mass with a rod, taking care not to let anything adhere to the pan. It will gradually assume a darker color until it becomes red. Stir it well and see if it be uniformly red and heated, then remove the pan from the fire and let it cool. When cold rub the mass fine in an earthen or porcelain vessel, pour boiling water upon it and let it stand for a day; then decant and add more boiling water, stir well and let it stand for another day, when decant and replace it by fresh. Stir again, and let settle for a few minutes, until the coarse iron-containing powedr has settled. Now pour off all the fluid down to the dregs into another vessel, let it stand in this for several days until the fine powder has settled and the water has become clear, which then pour off and dry the powder in the air; but not by the fire, powder dried by the fire scratches. The red powder thus obtained is ready for use, preserve in a dark place.

SCIENCE NOTES.

In 1807 wooden clocks began to be made by machinery. This ushered in the era of cheap clocks.

The Society for the Encouragement of Home Manufactures (France) has offered a prize of six hundred dollars for the best article sent to them describing the materials used in watches "*like those made in America.*

IMPROVED

CROWN FILLED CASE.

The Smallest, most Compact, and Symmetrical

Filled Gold Case ever offered to the Trade.

The Watchmaker, Jeweller and Silversmith,
A Monthly Illustrated Journal. Published in London.
The Representative Organ of the Watch, Jewellery and Kindred Trades in the United Kingdom.

It is full of original information and thorough practical instruction contributed by the leading writers on the various subjects connected with the above trades. The text is well illustrated by wood-cuts, and two supplements of artistic designs for jewellery, etc. accompany each number.

This important Trade Organ, now in its seventh year of publication is in the hands of every British Watchmaker, Jeweller and Silversmith, and is therefore a most valuable medium for manufacturers requiring publicity in Great Britain.

Our list of permanent contributors includes such names as: J. U. Poole, Richard Whittaker, Henry Ganney, Moritz Grassmann, J. Herrmann, E. J. Watherston, W. H. Singer, an ample guarantee for the sterling value of the journal. Subscription 5s. per annum.

N. B.—Always on hand a stock of
Stones, Imitations, Locket Glasses, &c
Unsurpassed in the Dominion.

A PAPER watch has been exhibited by a Dresden watchmaker. The paper is prepared in such a manner as to render the watch as serviceable as those in general use. Attempts have been made in this country to establish watch companies made of paper, but the schemes did not work.

So microscopically perfect is the watchmaking machinery now in use that screws are cut with nearly 600 threads to the inch—though the finest in the watch has 250. These threads are invisible to the naked eye, and it takes 144,000 of the screws to weigh a pound, their value being six pounds of pure gold.

A LONDON repairer of watches loaned a gentleman a watch until his own could be mended. The spring of the loaned watch broke. Commissioner Kerr, of the City of London Court decided that the wearer was not responsible. Said he, "I don't care about trade customs ; I am here to administer the law."

BRACELETS of old coin are all the rage, and some of the coins purchased at the noteable sale in New York a few days ago, are already dangling from ladies' wrists. Some of the prettiest coin bracelets are those of American gold one, two and a half, five, and ten dollar pieces, and nearly all the girls of the period have a pair.

SHOULD you ever happen to encounter a watchmaker who after making an investigation of your family turnip says: "My dear sir, there is uothing the matter with your watch ; it does not even need cleaning," set that man down as one who will never rise to eminence in his profession or become a millionaire.—*Commercial Advertiser.*

A NEW HOROLOGICAL SCHOOL.—The horological industry has received a great impulse in the Jura, Switzerland ; several projects are on foot tending to perfect its products, and to ameliorate the condition of the workman. The project is agitated of instituting a school of horology at Porrentruy and l'Hopital, in the Cantou Berne.

MOTIVE FORCE.—A company in Paris at present supplies motive power to small shops and families by means of vacuum. It has already constructed a line of about 700 meters, and furnished force to several small shops. A powerful machine, with air pumps creating a vacuum of about three-fourths atmospheres, furnishes the exhausting power.

TELEPHONE.—While the telephone does not meet with its full deserved success in Europe, the Chinese have siezed upon it with great avidity. The circumstance that each Chinese word has a separate word sign hindered the *queued* inhabitants of the flowery kingdom from using the telegraph, but the telephone, on the contrary, also speaks Chinese!

NEUCHATEL.—A Swiss watch manufacturer some time ago was sued for fraud, having sold a 7-karat gold watch case for 14-karat. Six watch case manufacturers from Locle were present as witnesses, and acknowledged freely and openly that this species of fraud had existed for years, and they could not understand why suits should be instituted for such a trifle. The manufacturer was sentenced to one month's imprisonment.

GOLD TURNED INTO VAPOR.—E. W. Morley. of Hudson, Ohio, lately exhibited two slides, each of a specimen of the metallic globules said to be gold, from the roof of the Mint at Philadelphia. These were examined with a two-third objective, and Prof. Hanks stated that his examination and treatment of them with acid showed conclusively that gold would become volatilized, and no doubt pass off in the fumes from the retort.

RECKONING OF TIME BY CHINESE.—Little note is taken by the Chinese of the flight of time ; they date their common events by "the year of the great snow storm," or "in the night that the white cow was born." Larger towns have sun dials, and the hours are sounded on large drums at the principal places. The mandarins and well-to-do people have lately affected not one. but a pair of watches, of the costliest Switzerland or France is able to produce ; a child born at eleven o'clock, December 31, 1880, is, at one minute past twelve, one year old ; he was born iu 1880, *ergo*, he must be one year old in 1881.

AN amateur was chaffering about the price of a table service in Dresden china. "But it is much too dear! ' There is not a single piece in it which has not been mended." The dealer has his answer pat. "My dear sir," he says, "why that is the very thing that makes the set valuable. This is the table service that Bonaparte broke when he kicked over the preliminaries at Leobeu l" The amateur, a little taken aback by this thrust, says : "Are you perfectly sure of that?" "Certainly I am. Would you like the same service without its being mended? I have that also."

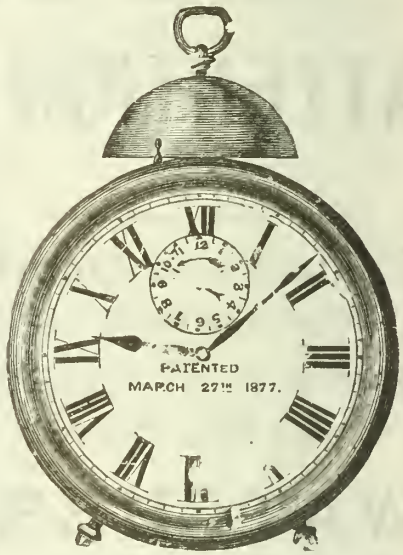
PROFESSIONAL SCHOOLS.—Paris couuts at present four large schools, in which young boys having an elementary instruction, may acquire a trade. Each day, the children. aged from eight to uine years, pass several hours in the shops, and, beside, are taught theoretical principles, designing, and modeliug. The Municipal School of Apprentices, at Villette, offers the opportunity to boys of the age of thirteen or fourteen, to choose a profession best adapted to their tastes and capacity. For this purpose, they may, during the first year, change from trade to trade, without troubling themselves about material ruined, and at the expiration of twelve months, are required to make their final choice. This plan of study consists of five hours per day devoted to instruction, and six hours passed in the shop. It is difficult to imagine a better system of obtaining superior and intelligent workmen.

NICKEL
SHOW CASES FOR SALE.

In consequence of their removal the undersigned have For Sale Very Cheap, Five First Class Nickel Show Cases, made by Millichamp, of Toronto. The Cases are square shaped, 12 feet long, 30 inches wide, and 20 inches deep, with Handsome Stained Stands. Are suitable for Fancy Goods or Silver ware. Cases and Stands cost $116. Will be sold for $80 cash.

Can be seen at the Wharehouse of

ZIMMERMAN, McNAUGHT & LOWE,
16 WELLINGTON ST. EAST, TORONTO.



THE WATCHMAKER
And Metal Worker
Is the official Journal of the
Watchmakers and Jewellers,
of the North west,
CONTAINING 56 PAGES OF
Illustrations and Reading Matter.
Whose columns are replete with choice articles upon Horology, Watch-making and repairing, written for this Journal by practical and scientific men ; also a large amount of general information of vital importance to the trade ; also continued articles, or lessons in letter engraving, written by a celebrated engraver of this city. Subscription price, $2.00 per year. Single copy, 20 cents.

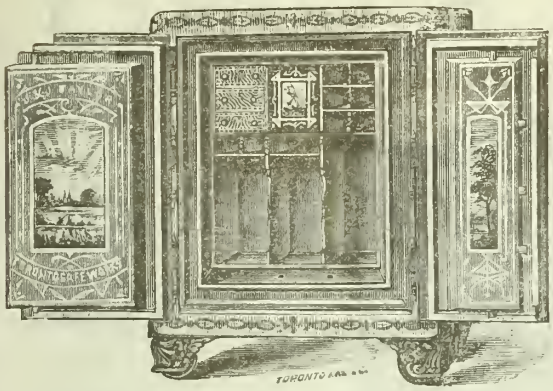
THE LARGEST
Clock House
IN CANADA.



I beg to direct the attention of the Trade to my large assortment of Clocks, from the following celebrated manufacturers, viz.:
SETH THOMAS, WELCH,
GILBERT, AND ANSONIA,
INGRAHAM.

I keep these Clocks in every style now manufactured, and show 200 different varieties of samples, besides Regulators of all kinds.

I will sell, only to the Trade, any of the above makes of American Clocks at prices lower than any house in Canada, and will guarantee to meet any competition either in quality, style or price. Also a large variety of Ladies and Gent's Swiss Watches, Gold, Silver and Nickel Cases, Key and Stem Winders.

SAMUEL STERN,
Sole Agent for SETH THOMAS' CLOCKS,
31 Wellington, 40 Front st. E., Toronto.

J. & J. TAYLOR,
TORONTO SAFE WORKS.

Patentees and sole manufacturers of Taylor's patent Fire proof Safes with

Non-Conducting Steel Flange Doors.

ALSO MANUFACTURERS OF

Burglar Proof Safes, Vaults, Vault Doors, Bank Locks, Combination Locks, Prison Locks and all Kinds of Fire & Burglar-Proof Securities.

20 YEARS ESTABLISHED.

The Oldest and Most Reliable Safe Manufacturing Firm in the Dominion

A. C. ANDERSON & CO.,

Editorial.

HOW TO SEND MONEY.

We often hear complaints from merchants, both wholesale and retail, about the uncertainty and risk of sending money. There should be but little trouble and no risk attached to sending money remittances if the few plain rules we propose to give below were faithfully attended to. A great many people when they make remittances have a habit of sending their money in bills, either by express, or by post in registered letter ; both of these methods are clumsy and the latter somewhat unsafe.

If a money letter goes astray, even though registered, the post-office department runs no risk of loss—the loss, if any, falls on the sender. It is true that the registration is a great help in finding out what has become of it, but it has often happened that when that discovery was made it was of no benefit to the loser whatever. Then again, sometimes when money is thus sent by letter, there arises disputes upon the amount really sent. The sender asserts that he sent a certain amount, say $25, the person receiving it says he only received $20; both are positive, and it is possible that they may both be right—that $25 was sent and only $20 received. It has happened before and it will happen again that money has been abstracted by some dishonest clerk, in which case the sender has to bear the loss ; or it may have happened, as is sometimes the case, that the sender had made a mistake in sending the money and really sent the smaller amount in place of the larger as he had intended. For these reasons we say the habit of sending money enclosed in letters is unbusinesslike, risky, and apt to lead to disputes, and should therefore be avoided by all those who want to do business in a trustworthy manner.

There are three ways of sending money that are absolutely safe, and at the same time as cheap and occasion much less trouble than any of those already mentioned. Sending by

POST-OFFICE ORDER.

Where there is no bank this will be found a very simple and perfectly safe method of sending money, and we would strongly urge our readers in out-of-the-way places, where there are no banking facilities, to use this in preference to sending remittances either by express or enclosed in letters. Sending by

BANK DRAFT.

This is a simple and safe plan, and the sender runs very little risk in adopting it. All drafts should be made payable to the order of the party or firm to whom the remittance is intended—this will effectually prevent any one else from making use of it, even if it by some mistake should chance to get into other hands, unless they commit forgery, which few people care to do. Sending by

MARKED CHEQUE.

This we consider the simplest, safest and most business-like method of any we know of. All that requires to be done is to write out the cheque, (adding collection), payable to the order of the party to whom the money is to be sent and get it marked "good" by the banker and sent on by letter in the usual way. There is little risk in sending it, for such a cheque is good to nobody except the person to whose order it is made—it is therefore safe. But beyond these considerations it has also this one, that the party to whose order it is payable must endorse it before they can get the money ; when it comes back to the maker, as it must do, he then has his own cheque with the receivers endorsation as a receipt that the money has been received. In fact such a cheque is receipt enough in itself. If the cheque should get lost in transit, the maker can easily stop payment, which would render it worthless to anyone except himself or the party for whom it was intended.

This method of sending money remittances by marked cheque has so many things to recommend it, that we are astonished that it has not been more generally adopted by our merchants than it has been. Some of the largest and wealthiest houses in Canada have given it a trial for some years and they say they would not willingly go back to the old method. This way of sending remittances is as near perfect as can possibly be, it is as simple as any, and above all it furnishes an incontrovertable receipt that cannot be gainsayed.

OUR FUTURE TRADE POLICY.

The past few weeks have been so filled up with election matters that people have apparently had but little time to devote to business. However, the great event is over at last and people already breathe freer, knowing that whether the elections have gone according to their wishes, or not, they are at least settled for the next five years.

Without doubt the great question of the election just over was, "what shall the future trade policy of Canada be, protective or revenue tariff?" and for the second time the people have given forth no uncertain sound upon it.

Notwithstanding the other questions, such as the "Boundary Award," "Disallowance Bill," and the "Gerrymander," the "National Policy" seemed to force its way to the front in spite of every effort to keep it in the background, and it is no exaggeration to say that the government were sustained, not because they had no bad marks against them, but in spite of these faults, and simply that the protective trade policy might be continued. It seems to us that the contest just passed was more of a plebisite upon the trade policy of the government than anything else, and it is safe to say that had this policy not commended itself so highly to many of those who differed from the government politically, the majority would have been very greatly reduced, if they had not been utterly defeated. The late election was a kind of anomaly in its way, the contestants although nominally two, being really three in number ; the party supporting the National Policy intact, composed of the Conservative party and Liberals who thought a sound mercantile policy with

a bad government better than a good government with a bad mercantile policy; the Blake party, who would support the national protective policy at present in force with a re-adjustment of some of its worst features; and, lastly, the *Globe* party, who were "again the government" and the N. P. in every particular, pronouncing the latter emphatically "a national folly and a national crime."

The Blake party and the *Globe* party were supposed to be synonymous, but in reality nothing could be further apart than their aims, the former being the party of "progress," the latter of "revenge." If the *Globe* had possessed discretion enough to have accepted the situation, and loyalty enough to the party it misrepresents to support its leader's policy with its whole strength, it is more than probable that the result of the election would have been very different from what it was. As between the present policy of out and out protection and Mr. Blake's modified form of it, many people had they been certain that the *Globe* would have allowed Mr. Blake to carry out his policy, would have supported him, but as it was, they voted for the government simply because they thought that the Liberal leader was not strong enough to carry out his expressed intentions; they considered that a return to the old state of things would be disastrous to the country. As the attempt for one man to sit on two stools is generally unsatisfactory, so the Liberal party found to their cost that the effort to run two opposite kinds of tariff policy was a decided failure, a result which might easily have been avoided had its leaders been as united as they should have been.

The result is, however, as we have stated, that as far as the next five years are concerned, and probably for the next fifty years, the tariff policy of the Dominion will be a protective one. Looking at the case dispassionately we must say that we think the people pronounced wisely, and that the true policy for this country is one that will foster and encourage our home manufactures. The idea of the *Globe* that this election had to be fought out on the same lines as that of 1878 was its supreme mistake; things had changed, but the organ, like some political Rip Van Winkle, had either been asleep or its faculties were so obscured that it could not take notice of the great changes that were taking place around it. The policy asked for by the people in 1878 had been given them, and under its influence factories had multiplied and millions of dollars had been invested in this way. Even admitting that factories were bad things in themselves and detrimental to the best interests of any country, having been called into existence by its almost unanimous voice they had become a legalized institution, and therefore possessed of a standing which entitled them to more consideration than the mere caprice of a moment. The people were bound to respect what they had themselves thus called into existence and legalized, and so the question of vested rights had no small share in deciding the contest. Liquor selling, which is an admitted evil, is licensed by law, and when money is expended on an evil thus legalized, the vested right of the person so expending his money is admitted by the country, and it has more than once declared that it has no right to take away his license without cause or compensation, and make him lose the money he had expended while under the protection and with the sanction of the law. If such is the case in regard to an admitted evil like liquor selling, how much stronger the claim of manufactories, which are not only not an evil, but such a positive good that no country can be truly great or prosperous without them. But these facts which were overlooked or sneered away by the *Globe* party, were very strong factors in the late contest, and many thinking men who refused to "bow the knee to Belial" and swallow their dictum holus bolus, men who would have been glad to have supported the Liberal leader under other circumstances, turned their back upon their party and voted for the trade policy in which they really believed lay the mercantile salvation of the country.

For our own part we have no hesitation in pronouncing in favor of Mr. Blake's national policy (as contained in his electoral address to his constituents) were we sure that it would have been faithfully carried out, but as between the tariff of the government and that advocated by the *Globe*, we must distinctly prefer the present policy, defective as it is in many points.

That a protective trade policy is to be one of the planks in the future platforms of both parties we have no doubt, and we have as little misgiving that if such a policy is properly adhered to that the country will be greatly benefitted thereby.

DO WE WANT A CANADIAN HOROLOGICAL SCHOOL?

In our last article on this subject we endeavored to point out the necessity that existed in Canada for an improved class of watchmakers; in the present we propose to put before our readers some of the results of such institutions in other countries, and leave them to decide whether the establishment of such schools here would not vastly benefit the trade and the public by turning out a higher class of skilled watchmakers than we can at present boast of.

A great many people take but little stock in such things as "Horological Schools" because they believe they are theoretical and not practical, and they have a thorough contempt for anything and everything that is not practical in itself, forgetting that it is mainly on account of theorists putting their ideas into practical shape that our mechanical and other facilities are so far in advance of what they formerly were. If there were no theorists, mechanics would advance very slowly, for the simple reason that any improvement would be but the result of accident. Theory, however, is ever pressing forward, and although it may in its eagerness be oftentimes visionary, yet there sometimes springs from seemingly chimerical ideas the grandest and most practical discoveries which revolutionize trade. But when we talk of a horological school for Canada we do not refer to a purely theoretical school, but rather to a practical one, where theory and practice shall be judiciously mixed, the latter, however, having greatly the preponderance.

Such a school, we think, can only be started at present by private enterprise (unless the trade as a whole should bring its claims before the Government) and we are inclined to think that even as a private enterprise it might be made self-supporting, if it did not pay a handsome dividend to its promoters. It may not be generally known but it is a fact nevertheless, that France snd Switzerland owe their supremacy in the watch trade principally to the advantages derived from the formation of Horological Schools.

In a very interesting article on Technical Education in Horological Schools, our clever contemporary, *The Watchmaker and Metalworker*, of Chicago, says in illustration of the offect of these schools in Europe:

"The well-known Claudius Saunier, of Paris, established many years ago in that city a school for the education

of watchmaker's apprentices, and by personal contributions of money and books, as well as energetic work in its behalf, the school flourished and led to the establishment of several in other parts of Europe; among which may be named those at Geneva, Chaux de Fonds, St. Imier, Bienne, Neufchatel, Fleurier, Soleure and Glasshutte. The school at Geneva was founded in 1826. In 1842 it was taken possession of by the city, and has a yearly budget of 48,000 francs, from which 4,000 francs are deducted. Each pupil from the city pays five francs, and outsiders pay twenty francs per month as school money. Foreigners have to pay the same amount as the others with the additional fee of 100 francs entrance money. Pupils are received into these schools after their fourteenth year, and must remain four and one-half years. They first enter for one year for raw work, when they learn the manufacturing of the single chief component parts. They then pass nine months in the class for mounting the wheel works, and an equal period in the class for the winding up and for the repeaters; the next year is devoted to the study on escapement, and the last year for final revision. Beside the practical handwork, the study of mathematics, machinery, drawing and physics constitute the chief branches of instruction, in which the pupils are aided by the professors in their best methods. There is also a special technical school at Chaux de Fonds in which from 150 to 200 pupils especially devoted to the art of decorating are provided, and this is a very important branch in the watch industry.

No other industry in the world has such a fixed system for regulating its work as the Swiss watch manufacturers. Sixty distinct masters are occupied with the manufacturing of the different parts of each single watch, and this is so divided that each workman manufactures throughout the year the same piece—for example, the hands or certain wheels—and by this means the workmen attain peculiar ability in their special work. Their former simple and primitive tools have been metamorphosed into the most complicated machinery, and their ability to perform work is enormous both as to quantity and quality. They generally work at home with the help of the members of their family, and then sell these finished component parts to the big manufacturers, under whose superintendence the watch is completed. Although these different parts are procured from different shops, they fit exactly together because they are made after one and the same number, measure, rule and system. Seventy thousand persons are now employed, but the production cannot be estimated exactly. A half million watch cases are made, and the whole production, including those sent abroad, amounts to at least a million pieces, representing 100,000,000 francs."

The question is if these schools have done so much for European countries, what would they do for Canada? Is the idea practical, and if it is who will put it into shape?

COMMUNICATION.

The Editor does not hold himself responsible in any way for the opinions expressed by correspondents.

Ottawa, June 17th, 1882.

The Trader Publishing Co., Toronto.

GENTLEMEN.—I notice in your June issue a paragraph devoted to the case of Ellis *vs.* Freudenberg. I trust that you will allow me space in your journal for a few words in reply, as no doubt something in self defence will be expected from me by your readers, especially by those who do not know Ellis & Co. as well as I, or the facts of the case. I positively deny taking all available funds with me on my leaving for Germany—on the contrary, I deliberately left sufficient funds at the disposal of my wife, who had all along assisted me in the management of my business, to meet the only accounts that would mature before my return, and the charge that I took with me some of my stock is also a false charge. I took no stock, and the judgment of the Court does not sustain such charges, and I here state publicly that at the time the attachment was issued I was not indebted one cent to Ellis & Co., or to any of my creditors, as is shown by the schedule of my liabilities now in Court, and had I been fortunate enough to have had my application made at an earlier stage, it must have resulted differently. I need make no comment upon the part of the paragraph that states I should have notified my creditors before leaving, &c., as it is simply consistent in the absurdity with the rest of the paragraph. I have suffered great damage at the hands of Messrs. Ellis & Co. and their two willing instruments in this city, but I hope by close attention to business a business will soon be built up that will be lasting monument to the shame and disgrace of him who one day entered and left my store as a friend and well-wisher and the next morning put in the Sheriff and gutted my store, leaving my wife and family in my absence helpless, without means of support.

Yours respectfully,
E. FREUDENBERG.

MR. DUCHEMIN, in a late session of the Academie des Sciences, Paris, proposes to substitute pivots made of iridized platinum, in place of common steel pivots of chronometers.

Selected Matter.

WORKS OF ART REPAIRED.

ANCIENT AND MODERN DAMAGED BRIC-A-BRAC TURNED OUT AS GOOD AS NEW.

The sign over the doorway presented the occupant of the building to the world as a "Repairer of Art Treasures," and the samples of large damaged vases, broken bronzes, and dilapidated armour displayed in the ample windows gave promise of interesting matter within. And, in fact, the establishment appeared to be a vast and mysterious repository of damaged art, such as even Little Nell and her grandfather would have wondered over.

"You see," the proprietor said, "we get a great variety of goods for repair after the May movings. Many people are careless in handling works of art, and some of the finest of them are the most fragile. Here is a noble piece, or pieces rather, of Dresden ware, which will be repaired into a large and elegant *tazza* when we get its hundred or more fragments together. How people can possibly make so thorough a smash of a thing, I cannot understand. It is true they might throw it against a wall, or drop it out of a third-storey-window to the sidewalk. We get many things as bad as this, and some that are worse. This other group is also badly broken up. In statuettes like this, the neck is almost invariably snapped. Heads, hands, arms, and fingers oftenest need our services; legs are next in the order of accidents.

"Can we repair noses? Well, I will show you an example in point: tell me where this one is joined to the face. You cannot perceive it? You pay us then a high compliment. If you could detect a blemish we would not be good repairers. You may see a trace of our handling with this magnifying glass, but not otherwise. It is one thing to stick on a nose and quite another to repair it artistically. The two historical noses that stand fixing up the best and oftenest are Washington's and Wellington's. Owing to their prominence, you understand, they are easiest broken, but thanks to their size and substance they are the most satisfactory to repair. It is lucky for the Asiatic and Egyptian idols which are now so plenty here, they have mostly flat noses; it preserves their integrity, and saves us much work with the file.

"In large breakages we often have to

supply many pieces. Here is a fine Sevres vase ; it contains seven insects, one of which is four inches long. We first make the porcelain paste and fit it accurately. It is then colored, decorated, glazed, burnt and cemented to its place. This restoration will cost $60.

"We have sometimes repaired articles, mostly ceramic, where our bill exceeded their real value, though by no means the actual cost of the goods when perfect. People are very often deceived in buying such things. This salver is a fine piece of work in its way, yet it is only an imitation of Sevres, worth perhaps $40. If genuine it would bring $200 or $250 at auction. Our repairs will cost about $50. It was knocked down a flight of stairs by an intoxicated footman. Some ceramic articles are sent here for repairs whose intrinsic value resis upon the fact that they are unique or at least antique. They have perhaps been manufactured or decorated from special designs, or, being true antiques, are rare. Here is a remarkable piece of old faience. It's ugly, but rare and includes an idea. The grayish patch on this side you will notice represents a spider's web, and this resplendent beetle is tangling up his beautiful legs in it. That gorgeous long-limbed owl is shaking his wise old head as he watches the game. The colors you observe are very intense and beautifully worked as to the figures, yet the rest of the vase is quite dull in appearance. It would take a large sum to buy it, however.

"Alabaster is hard to repair ; being translucent, the strong cement required is apt to make troublesome shadows below the point of fracture. Here are some fine alabaster sea horses whose necks were broken in trying to support a mosaic table upon which a young man seated himself after a wine dinner. The repairs will cost $50. It is good for my business, but I am often shocked by such things.

"Excuse me ; an expressman is unloading a vase at the door. Did you hear what the messenger said ? 'It must be repaired by to-morrow, sure, as it has been sold.' It is from an importing house ; the vase was broken while they were loading it. It will be repaired and nothing said about breakage. This often happens. The vase, after all, will be as good as ever for decorative purposes. The cause of breakage among dealers is often bad packing. It is an error to pack fragile goods tightly ; for every jolt from without is felt within. There should be some "give" to the packing. Many people who think they have a perfect piece of faience would be surprised to learn how many times it had been smashed in say from one to two hundred years of miscellaneous handling.

Tiles and plaques of all sorts are sent to us. They are easily repaired, except where there is a loss of substance or of color. The Berlin plaques are superb, but we find them very brittle. Table or chimney-piece ornaments are more exposed to breakage, however. This royal piece of Sevres is covered with the most fanciful designs of birds, fish, reptiles known and unknown. There are some beautiful bits of color in it. It is unique, worth a large sum. I would gladly give $100 for it as it stands, though broken in fifty pieces. A man took it down from a shelf where it had stood for fifteen years and let it drop on the hearth. The repairs will cost $75. This Louis XVI. piece is thought to be genuine by the owner. It is pretty, but is only a German imitation. To repair it will cost $45. A new one may be had for about $30.

"Here is a piece of very fine porcelain, a salver, once the property of the Empress Josephine. The arms of the empire with the 'N.' and 'J.' in the centre stamps its value. Dresden ware is oftenest sent to us. On this vase we will have to replace four or five china roses. Can we make Dresden ware in New York ? Well, I assure you that we shall use material in this work which cannot be distinguished from the best made in Dresden.

"This large miscellaneous lot of clocks, bronzes, silver and delf ware were taken from the derbris of the Morrell storehouse fire. It is a curiously dilapidated collection, but we will be able to rescue much of it. There you see Ward's headless Indian opposite the Laocoon—the snake is missing—and a bronze mandarin is staring at the mutilated Berlin Amazon. That satyr has had his curious legs melted off, but we can easily restore them with all their pristine peculiarities.

In the lighter goods sent for repair the most elegant are fans, most of which are sent us regularly after each season. Here is a fine specimen of a fan made of thread lace and carved ivory. The fashion among ladies of carrying them dangling at their sides works very well for us. If they escape hard knocks they are certain sooner or later, to be sat upon by their owners. This superb combination of dark pearl, lace, satin and feathers, decorated by a distinguished Paris artist, was all but ruined in that way. It is worth $200. Our bill for repair will be $35.

One of the finest pieces of work we have here now, is this beautiful piece of *cloisonne* and enamel. The body of the vase is of copper, but every dividing strand you see in that exquisite tracery is of gold inlaid, and the colors are scarcely equalled by any European work old or new. It is of Chinese workmanship ; not even the Japanese artist can compete in this particular style of decorative art. The sides of the vase were jammed together nearly flat though bad packing, and the golden threads were forced out so you could take them up in a bunch. Each strand has been carefully replaced and enamel restored in parts. The vase stands but about fourteen inches high, but no European artist could match it short of five years of constant labor. It would pass almost unnoticed by any one not a connoisseur.

"Ah, yes, we save many valuable works of art from destruction. If we were paid in proportion to the value of our work we would do well. As it is we earn scarcely more than the wages of skilled labour. But I must leave you now to attend court in a somewhat peculiar case growing out of business. A man has lost some valuable works of ceramic art by fire. They were insured, but the company refuses to pay the amount in full, on the ground that some of the articles were lessened in value through having been previously broken and repaired. My testimony is wanted to show that the restoration was done by us. I can give no evidence to this effect. If the goods are now lost I cannot be expected to recognized my work upon them. I could not otherwise identify the goods, for if I were to keep descriptive account of the goods sent me, my books would be too voluminous to store within the city limits. We have little time to do more than receive articles, repair them, and see that our accounts are closed with cash."—*New York Sun.*

Cleaning-rags.—Cloths with which metallic surfaces may easily and rapidly be cleaned, are made by steeping woollen cloths in a solution of 4 grams Castile soap and 20 g. water, adding 2 g. tripoli to the solution, and dyeing it red with fuchsine.

CHRONOLOGY OF THE TIMEPIECE.

By timepiece we understand that instrument by the aid of which we divide the day into twenty four equal parts. As well known, the ancients already possessed such contrivances, sand or water hour glasses, and sun dials, 740 years B. C., and tradition has it that the obelisks served as gnomens for the Egyptians and Phenicians; Caliph Haroun al Rachid presented Charlemagne, in 809 A. C., with a copper clock propelled by sand. History is very vague with regard to the exact date of the discovery of clocks; it is said that the wheeled timepiece was invented in the 14th century; first by Richard Wallingford, Abbot of St. Albans, England; next by Giovanni Dondi, a doctor and astronomer at Padua, and finally, by Henry von Vick, a German clockmaker, in Paris, who, at the order of Charles V., constructed the first tower clock in Paris (the square is still called Place d'Horloge). The honor of the invention of the actual watch pertains to one Peter Hehle, of Nuremberg (the first watches were call *Nuremberg eggs*), in 1500. About the same time the second Strasbourg clock* was constructed. The subsequent improvements and inventions are due to the great number of watchmakers and men of genius, and in the following we give the names of those who made essential adaptations and inventions, and earned immortal fame.

1595. Gallileo invents the pendulum, whereby the means is offered for regulating the motion of the wheel clock; his son Vincent, however, in 1649, makes the first practical attempt to adapt it to the clock.

1656. Christian Huyghens (pronounced Hoigens), a Dutchman, finally succeeds in constructing the first pendulum clock; he later constructs several marine watches, but finally invents the balance spring, by the use alone, of which a marine timepiece becomes a possibility.

1675. Barlow and Quare, London, make the first repeating movements, first for clocks, next for watches.

1680. Clement, London, invents the anchor escapement (clock).

1695. Tampion invents the dead-beat escapement, and uses it first in a watch.

1700. Fatio, of Geneva, perforates rubies, and uses them as pivot holes.

1715. Graham, London, constructs the mercury compensated pendulum, invents the cylinder escapement, and the dead-beat escapement for astronomical clocks.

1726. John Harrison, England, constructs the gridiron compensated pendulum, and in 1761, when 67 years old, the first marine watch, receiving the prize of £10,000 therefor from Parliament. (This excellent horologist died 1776, at the age of 82 years.

1754. Caron de Beaumarchais, the son of a watchmaker, invents the pin escapement for watches; but at a later date, follows his poetical inclination, and composes the Barber of Seville, Figaro's Marriage, etc.

1755. Ferdinand Berthoud, born 1727, in Canton Neuchatel, greatly promotes the interests of horology by his writings and treatises. He also constructed several, and better watches than Harrison, and died in 1807, in California, whither he had gone, at the age of 80, to observe his last clock. Ferd. Berthoud undoubtedly was one of the greatest watchmakers that ever lived. The celebrated *Abbe* Chappe, inventor of telegraphy, was his nephew.

1765. Pierre le Roy invents the compensated balance wheel, after having constructed a marine watch, for which he obtained a prize from the Academie des Sciences.

1770. Duplex, England, invents the escapement named for him, and greatly esteemed at the present day.

1772. John Arnold, also English, makes several improvements, and afterward invents the marine chronometer with dead-beat spring escapement, and approximately correct compensated balance.

1805. Urban Jurgensen, Copenhagen, constructs the first steel cylinder scape wheel, and greatly contributes to raise the art of horology by his improvements and writings. Thus, for instance, he materially improved Arnold's dead-beat chronometer escapement.

1821. Rieussac, Paris, invents the writing clock.

1823. Perrelet constructs an astronomical clock showing the hours, minutes, seconds, even 1-10 seconds. From this time forward, Breguet, Louis Berthoud, Houriet, Wagner and Perron, by dissertations and pratical improvements, gave the incentive to bring the art of horology to a high standard, and to make it commensurate with the requirements of the present age.

It would lead too far to mention the many different inventions and improvements made in this century—the Geneva musical boxes, the orchestrions of the Black Forest, the astronomical clock of Strasbourg, etc. In the line of watches, the standing seconds, the course of the moon, perpetual almanac, etc., automatically-striking hour, ¼ and ⅛ hour, yea, minute repeaters; again, the remontoirs, and in latest time, the chronographs, etc. If we remember that the art of horology has labored from the year 740 B. C. to the middle of the last century, without leaving its cradle of infancy, and contemplate the grandeur of the inventions of the present time, the thinking mind will be tempted to incline his head in reverence when he hears or sees the names of Graham, Harriston, Breguet, Berthoud and others.—*Jewelers' Circular.*

*Strasbourg possessed three different clocks. The first was built in the year 1352, under John von Leichtenberg, and finished in two years; the the second one was commenced in 1547, and, on account of death and other interruptions, finished in 1574; the present third clock was built by John Baptist Schwilgue in 1838, and finished in 1842. Only a few insignificant portions of the old clock were retained.

BUSINESS CHANGES FOR JULY.

Jno. Bertram, Peterboro, hardware, has sold out to M. Miller, possession 1st July; T. Crispin, Guelph, hardware & tins, removed to Woodstock; Mitchell & Gage, Hamilton, woodenware, &c., partnership dissolved, Thos. Mitchell continues alone; L. Atkinson, Newmarket, jewelry stock advertised for sale by Sheriff, 8 inst; E. H. Reeves, Waterford, hardware, advertises business for sale; Geo. Getz, Hamilton, jeweler, dead; Ellis & Woodward, Port Rowan, hardware & tins, have dissolved, Jno. Woodward continues alone; Robb, Miller & Son, Montreal, wholesale stationery, burned out; W. S. Anderson, Winnipeg, jeweler, given up business here; D. M. Demill, Shannonville, hardware, sold out to S. E. Mills.

BUSINESS NOTES.

In 1834 all the table cutlery used in the United States was imported from England. To-day, of an annual consumption amounting to $2,500,000 worth, not more than eight per cent. comes from England.

Messrs. C. & J. Allen, of this city, have rented half of Trout & Mitchell's drug store, in Winnipeg, and are going to open out a branch of their business there. It is to be under the personal supervison of Mr. Joseph Allen.

The new Electro-plated Ware Factory lately erected in this city, is now finished, and the engine and machinery are being fitted up as fast as possible. They expect to commence the

FACTORIES:

WALLINGFORD, U.S. — AND — **MONTREAL, CANADA.**

The Wm. Rogers' Goods sold by us are made under the supervision of Mr. Wm. Rogers, formerly of Hartford and West Meriden, son of the old original Wm. Rogers, who died in 1873. Please do *not* associate us with goods made in Hartford, Ct., with which we have no connection. We make all the goods we sell, and have our own especial patterns.

SIMPSON, HALL, MILLER & CO.

manufacture of new goods right away, and to have a full line of samples ready for this fall's trade.

Mr. R. Y. Ellis, of the firm of P, W. Ellis & Co., Wholesale Jewelers of this city left for Europe last week on the business of the firm. Mr. Ellis proposes visiting the markets of England, France and Switzerland before his return. We wish him a safe and prosperous journey.

The men, Miller and Webb who were arrested in Kingston some weeks ago for the robbery from Messrs. Lee & Chillas of this city were tried at the late assizes and found guilty. The Judge sentenced them each to three years in the Provincial Penetentiary. Serves them right say we.

The Stock of L. Atkinson, jeweler, of Newmarket was sold at Sheriff's sale at the Court House, Toronto, on the 27th inst. for the benefit of his creditors. It was put up *en bloc*, and after some spirited bidding realized the exceedingly high price of sixty-three cents on the dollar, the purchasers being Messrs. E. & A. Gunther & C. & J. Allen, of Toronto.

New Hats are all the go for election bets, and as a consequence we see hundreds of them about since that event was decided. This is all right for the hatters, but could'nt the jewelry trade manage to shunt the public on to some article of jewelry instead of hats? If it could be done, it would liven trade in these idle dog days.

A Mark of Respect.—A pleasant affair took place at "The Club," Yonge Street, a few nights ago, when Mr. Geo. Fitzsimmons, who is about starting business in Guelph, was entertained by his friends. He was presented with a purse of $100 and an illuminated address. Mr. Fitzsimmons carries with him to the Royal City the best wishes of a large circle of friends.

Jewelers as a rule are not rabid politicians, and seldom take very active interest in the politics of the country. In the late elections, an exception might have been found in the person of Mr. S. T. Culp, wholesale jeweler, of this city, who not only composed a campaign song in favor of John A. and the N. P., but but published and distributed several thousand copies of it at his own expense. In addition to this he spent two weeks stumping the Welland district on behalf of the N. P. candidate. Although untrained, Mr. Cult is an orator of no mean ability, and it is more than hinted that Mr. Osler's defeat was mainly owing to the brilliant defence of the present tariff by the Toronto jeweler. Although we do not take much stock in politics, we must congratulate Mr. Culp on his brilliant *debut* as a public orator.

Referring to our old townsman, the Sydney (N. S. W.) *Herald* says, "At the Athenæum Club, yesterday, a banquet was given to Mr. Donald Manson, representative of the Waltham Watch Company, on the occasion of his leaving *en route* to the United States, per City of New York. The chair was taken by M. Hugh George, who proposed the health of "The Queen," of "The President of the United States," and of "The Guest of the evening." The chairman expatiated on the energy, enterprise, and courtesy which has been shewn by Mr. Manson during his sojourn in these colonies, and the toast of his health was drunk with enthusiasm by the company present. The chairman assured Mr. Manson that he would leave the country with the best wishes, not only of those present, but also of a large section of the people of the Australian colonies. Mr. Manson replied in appropriate terms, and the company separated after having spent a very pleasant evening.

Jewelers' Picnic.—The firm of P. W. Ellis & Co., manufacturing jewellers of this city, gave their first annual picnic last week to their employees and friends, numbering over 120, who left by the steamer McEdwards, especially chartered for the occasion, to Victoria Park, accompanied by a full string band. A most enjoyable day was spent, the committee having provided every variety of amusement, including dancing, football, cricket, croquet, and a good programme of athletic sports, to the winner of which valuable prizes were given. The football match was between the gold chain makers and jewelers on the one side, and the watchmakers, engravers, polishers, and clerks on the other, and resulted in a draw. An amusing feature of the athletic sports was a quarter mile walking race between the young lady employees of the firm. Dinner and supper had been provided for the party. After partaking of the latter the evening was spent in songs, recitations and speeches. The party returned about ten o'clock highly pleased with the day's outing.

The Employees of one of our large fancy goods and jewelery importing firms recently held a very successful rowing regatta on the bay. Much interest was manifested in the event, from the fact that a determined attack was to be made on the record, as several of the contestants had made remarkable private trials. These mysterious rumors went the round of the sporting fraternity, and on the eventful evening a large number assembled on the bay to witness the exciting struggle. A good start was obtained, and for about two hundred yards but little difference was noticeable in their relative positions. The road representatives here commenced to weaken owing so we have been informed, to over-training, and the home men commenced to forge ahead. One of these became unseated presumably from undue pressure, and it now became a question of the survival of the fittest, which in a short time was decided by the cool and collected jewelry manager crossing the line with a good three lengths to his credit. It is needless for any comment as to time. The record at the close of the season will plainly show what has been accomplished.

WORKSHOP NOTES.

Another alloy consists of copper and nickel, and evinces far more powers of resistance than the ordinary alloy of brass and copper; it is gradually being introduced into the manufacture articles of commerce.

Stamping Color.—A color that dries slowly upon the color pad, yet is quickly absorbed by the paper is preferred; of 16 parts firm aniline color (blue, violet, red, etc.), 7 glycerine, 3 syrup, and 80 distilled water. The aniline color is dissolved in the hot water, and the other parts are added, while stirring.

New Alloy.—The *Revue Chronom*, publishes a recipe of an English alloy, remarkable for its conducting, malleable, and permanent properties. An analysis by Mr. Philipps proved it to be composed of, platinum, 80,660; iridium, 19,079; rhodium, 0,122; iron, 0.093; ruthenium, 0.046 parts—100,005 parts.

Origin of Diamond.—Mr. J. A. Roord Smith publishes in the *Archives Neerlandaises des Scienees exactes*, a treatise on the diamond mines of South Africa. He states that the diamond is found in a primitive gangue of a volcanic origin; the presence of a bicarbonaceous silicate of lime is a charactaristic sign of these mines, and deems them to be extinct craters of volcanoes. His hypothesis is that the diamond is of volcanic origin, and formed by the assistance of organic matter under the influence of great pressure and a high temperature. The late artificial production of diamonds appears to favor this view.

It has been found that by an addition of from 1 to 13 per cent. of phosphorus to bronze, a very desirable alloy is produced, different in appearance and properties from the common bronze. It assumes an extra degree of hardness, which permits it to be employed with an advantage in the mechanical arts. Many parts of machinery bearings, kuobs, drawers, slides, etc., exposed to great wear and tear, may be manufactured therefrom.

Etching upon Metals.—Cover the surface of the metal on which you desire to etch, with white melted wax; when cold, trace the design or character upon it with a sharp point, which penetrates through the wax layer. Into these lines pour either, very strong vinegar or pure acetic acid, and spread upon it a powder made of 100 grams rock alum, and the same weight of sulphate of copper, previously calcined in a crucible in the fire. To have the engraving deeper, as soon as the effect of the first mordant is spent, wash the wax in cold water, without rubbing, however, let it dry and repeat the operation. By renewing it as often as necessary, the workman has it in his power to regulate the depth of the engraving according to his liking.

To Make Mock Coral.—Two sticks red sealing wax, ½ oz. white bee's wax; melt all in a tin cup, then have some some small brambles, clean off the bark well, washed in turpentine. While wax is hot plunge in. In drawing out put in cold water. This coral can be fashioned to any design, and is of a deep scarlet color, and is used for ear rings and breast pins. If too brittle add a little more bee's wax.

To Make Mock Diamonds.—Take half lb. crystalized alumn. dissolve in boiling water, when thoroughly dissolved, add small piece of gum arabic and get fine scieve in pan and with one get cold water. If any of the above crystals are larger than what is reqnisite for medium subles, you can dissolve to change the color, to burned amber or burned cochineal. For soppires they have a pretty effect and if arranged in clusters or single settings, with pass light will almost defy an expert to locate their value.

WE BEG TO CALL THE ATTENTION OF THE TRADE to the well known quality and elegance of finish of our Gold Cases, guaranteed by us to be of eighteen karat Gold, U. S Mint assay, or of fourteen karat Gold, as may be stamped, and also to our mode of selling the same, charging only for the ACTUAL WEIGHT *of the gold used, and not for the base metal comprised in springs, key pipes, filling of crown, etc. To illustrate which we here show copy of tag accompanying each one of our Gold Cases, which plainly indicates not only the gross weight of the Case, but also the* NET *weight of the gold.*

AMERICAN WATCH COMPANY,

ROBBINS & APPLETON,

New York, August 1st, 1881. General Agents.

IN EXPLANATION OF THE ABOVE we desire to say that the old plan of charging for the gross weight of the case, as if it were all gold, worked well enough as long as the manufacturers were content with the amount of brass and steel actually required in its construction; but when the business was degraded into a contest as to who should get the most base metal into the least quantity of gold and call it a GOLD case, then the time came when, in the interest of dealers in American Watches, it became necessary to adopt a plan of selling, showing the buyer exactly how much GOLD each Case contained.

In adopting this method we act in conformity with the earnest wishes of the leading houses of the Trade, some of whom have already undertaken to carry out the same idea in their own business.

ROBBINS & APPLETON,

GENERAL AGENTS.

SCIENCE NOTES.

An apparatus for the determination of melting points has been described by Mr. C. F. Cross and Mr. E. J. Bevan. It consists of a small platform of thin ferrotype iron or silver, having an opening for the reception of a thermometer bulb, and a small indentation or depression. A very small quantity of the substance is melted in the little depression, and while still liquid, a thin platinum wire, bent like an L and fused in a glass float, is immersed in the liquid and held there until the substance solidifies. A thermometer is then inserted in the opening andthe whole apparatus plunged under mercury, which is gently heated, and the thermometer meanwhile is carefully watched. When the substance melts, the float rises instantly, and the temperature is noted.

One of the chief defects in the arc electric light is the slight unsteadiness arising from imperfect regulation of the carbons. M. Salignac, one of the most active electricians of Paris, has discovered a new regulator which was to be one of the curiosities of the *grande soiree* to be given at the Observatoire on March 13. Each of the two carbons is supplied with a parallel rod of glass, to which it is attached in a solid manner. These two rods being placed horizontally, are pushed by a spring, and the spark is lighted between them. But between the two glass rods there is a glass stopper which is warmed by the light in such proportion that the rods yield gradually to the pressure of the springs, and the carbons can approach each other, as is required for the constancy of illumination. A correspondent of *Nature*, who witnesed some preliminary experiments, states that they were a wonderful success.

The Professor and the Inventor.—The following is a good story about a well-known professor, which may go to prove that even great physicists are liable to error :—The professor was showing a party of ladies and gentlemen over some large works at Birmingham, chiefly engaged in the manufacture of complicated optical instruments. The party came across a very ingenious instrument, the working of which the professor proceeded to explain. In the midst of his exposition, a roughly-dressed young man, standing near, struck in, and civilly pointed out that the man of science was quite mistaken in his notions as to the instrument in point. The professor, whose weak point is not an excess of humility, angrily maintained his own view, but did not succeed in convincing his opponent, who finally shrugged his shoulders and walked off. "Who is that—that *person?*" asked the professor, indignantly, of a workman standing by. "Oh! that is Dr. ——," was the reply; "he invented that instrument you have been looking at!" Tableau.—*Quiz.*

Sir W. Thomson showed in his inaugural address last year to the British Association, that if it were desired to transmit 26,250 horse-power by a copper wire half an inch in diameter, from Niagara to New York, which is about 300 miles distance, and not to lose more than one-fifth of the whole amount of work—that is, to deliver up in New York, 21,000 horse power—the electromotive force between the two wires must be 80,000 volts. Now, what, asks Professor Ayrton, is to be done with this enormous electromotive force at New York end of the wires. The solution of this problem, he says, was also given by Sir W. Thomson on the same occasion, aud it consists in using large numbers of accumulators. All that is necessary to do in order to subdivide the enormous electromotive into what may be called small commercial electromotive forces, is to keep a Faure battery of 40,000 cells always charged direct from the main current, and to apply a methodical system of removing sets of fifty, and placing them on the town supply circuits while other sets of fifty are being regularly introduced into the main circuit that is being charged. Of course, this removal does not mean bodily removal of the cells, but merely disconnecting the wires. It is probable that this employment of secondary batteries will be of great importance, since it overcomes the last difficulty in the economical electrical trausmission of power over long distances.

Mechanical Music.—The Black Forest is famous for these mechanical organs—orchestrions, as they are called—and in some instances they are brought to great perfection. There is a shop close to the exhibition, bearing the name of Lamy Sohne, full of clocks and singing birds and orchestrions, where you may pass half an hour in a faryland of surprises and all kinds of mechanical music. Oue morning I went in with an old lady and gentleman—the latter a grave dignitary of the Church of England. "A very tiring place," said the old lady; "all up and down hill; the only fault I find with the Black Forest. Couldn't they level it my dear?"—to her husband—"or build viaducts or something? Or at the very least, couldn't they organize pony chaises all over the country—like those, you know, that we found so usefnl at Bournenonth last year?" "Take a chair, my love," said the old gentleman, without committing himself to an opinion. And he placed one for her, while the young man in the shop (whose jolly, good natured face and broad grin delighted one to behold) wonnd up the orchestrion. The old lady sat down somewhat heavily from sheer exhaustion, and immediately the chair struck up the lively air of "the Watch on the Rhine," with a decidely martial influence upon its occupant. She sprang from her seat as if it had been a gridiron, and asked her husband reproachfully if he was amnsing himself at her expense, and whether her age was not snfficient to secure her fram practical jocking. "Dear me!" cried he, in amazemeut, looking at the offending chair as though he expected it to walk of its own accord. "What a musical nation these Black Foresters are! It's music everywhere! The very chairs you sit down upon are full of it." At this moment the orchestrion struck up a selcction from "Don Giovanni," and the old lady recoveredher amiability in listening to a really splendid instrument. I left them still enjoying it, marveling at alll the birds and boxes, and thinking each one more wondeful than another.

NICKEL

SHOW CASES FOR SALE.

In consequence of their removal the undersigned have For Sale Very Cheap, Five First Class Nickel Show Cases, made by Millichamp, of Toronto. The Cases are sqnare shaped, 12 feet long, 30 inches wide, and 20 inches deep, with Handsome Stained Stands. Are suitable for Fancy Goods or Silver ware. Cases and Stands cost $116. Will be sold for $80 cash.

Can be seen at the Wharehouse of

Editorial.

TRADE PROSPECTS.

We are glad to learn from the various sections of the country, that the prospects of an average crop will be more than realized, and that from the present indications the harvest of 1882 will be even more abundant than that of last year. This is cheering information, because depending as we do mainly upon our agricultural resources, it insures to the country at least another year of prosperity. An abundant harvest means to Canada wealth and prosperity, because, it puts the farmer in a position to pay for what he buys, it enables the general dealer to square up with the wholesale merchant, and it also enables the importer to meet his engagements with the foreign manufacturer, from whom he obtains his goods. Good crops and prices are the keystone of our national prosperity, and when we come to sift the whole matter down to first cause, we shall find that after all the farming population are the mainstay of the country, and it depends almost entirely upon their condition whether trade is prosperous or adverse. Those who live in cities are often apt to underrate the status of the farmer in the commercial economy of the country, but as a matter of fact, the storekeepers and manufacturers spring into existence almost entirely in order to supply the farmers' wants, and when this class becomes too numerous to do this economically, some of them are bound to go to the wall for want of something to do. This being the case, it is of the utmost importance to our commercial interests that our farmers should be prosperous, because poor crops through them, means disaster to the whole mercantile community. For these reasons we are glad to be able again to chronicle the fact that our crop prospects are above the average, and give every sign of an abundant harvest. Our merchants throughout the country may therefore look forward to a very busy time this fall, and may pretty safely calculate on a large and paying trade. With this in view, they should now begin to make preparations by getting their stock in good shape, jobbing off their old lines and making way for the novelties that are sure to be put upon the market. A word to the wise is sufficient, and we trust that all our friends will be found ready to take advantage of the increased trade that is sure to follow an abundant harvest.

ABSCONDING DEBTORS.

Although a certain proportion of people in business are bound to fail, and that, in spite of their utmost endeavours to prevent it, it is no reason why others who might command success were they so disposed, should deliberately lay themselves out to "come to grief" and not only cheat their creditors but forever ruin their own reputation.

It is a lamentable fact however that such is the case, and that traders are to be found (rarely we are happy to say) who will thus by deliberately swindling their creditors make their name stink in the nostrils of all honest men. As a rule creditors have a good deal of sympathy and are always ready to help an insolvent who through misfortune or a combination of circumstances beyond his own control, has been forced to succumb to the pressure, but for the debtor who deliberately lays his plans to cheat his creditors and enrich himself at their expense, there can be nothing too severe and he should be punished if possible to the full extent of the law. An honest man, although an insolvent, while he may not like to have to ask the leniency of his creditors, has or ought to have the courage to meet them face to face and state his case and ask their sympathy and assistance, and as we have said above it is only in exceptional instances where such help is asked that it is withheld. It is only the dishonest debtor whose career will not bear the daylight, that has any cause, or as a rule, who does light out and seek new fields in which to find fresh victims.

We are glad to say that Canada is not cursed with many merchants of this class, and we could do without even the few we have if we could be safely relieved of their presence. One of the latest of these "emigrants" and the one who has given rise to these remarks is R. H. Gordon, jeweler, of Ridgetown, Ont., a gentleman whose sudden departure has left many sad hearts and badly balanced accounts amongst the wholesale trade of this Province. Mr. Gordon has been in business for some years, and although regarded with suspicion and refused credit by some houses, succeeded in working himself into the confidence of others. The result has proven that this confidence has been sadly misplaced and that Mr. Gordon's line of credit should have been limited to any goods he paid the cash for before he got them.

A few weeks ago Mr. Gordon's creditors were astonished at receiving from his clerk an "identical note" which read as follows:—"Mr. Gordon and wife went for a trip on the upper lakes last week; I have just received a letter from him to say that he will not be back again, and to send you some goods which I have sent you by express this day."

This is certainly about the coolest although hardly the most refreshing thing we have heard during this hot spell, especially when it is known that the goods returned did not amount to anything like a tythe of the amount of his indebtedness. It is to be hoped that the creditors will take the trouble to follow Mr. Gordon up and have him disgorge the plunder he managed to secure before he sailed away on the western pleasure trip.

Exit Gordon—having left Canada for the country's good, we trust that the farewell will be a long one, as this country does not take kindly to merchants having proclivities such as the one indicated by the letter published above.

AVOID THE APPEARANCE OF EVIL.

The case of Fruidenburg v. Ellis, of which mention has several times been made in our columns is, although uncommon, not altogether singular. We have known several instances during the past ten years, of merchants who suddenly

and mysteriously disappeared much to the grief of their friends and creditors, and afterwards turned up again to assure them that their absence was only the result of a passing freak and meant nothing. Such conduct, however funny it may seem, is hardly in keeping with the habits of a first-class business man, and we can scarcely wonder that Mr. Fruidenburg received the treatment he did considering the circumstances of his absence.

We think common sense should dictate the propriety of any business man intending to leave his business for a while, that he should go through his accounts carefully and see what notes he has maturing during the time he expects to be away, and at once make some arrangement either to pay them in full or to get the creditors to whom they are owing to carry them until his return. We say common business prudence should dictate some such course as this, for it is not only awkward for the wholesale merchant to have maturing paper entirely ignored in that way, but is ruinous to the debtor who allows such a thing to happen. Business is business, and the debtor who is reckless of his own credit need scarcely be surprised if his creditors fail to trouble themselves as to whether his good name is maintained or not. Some merchants seem to think that it is a matter of indifference to wholesale houses whether their notes are met or not, they let things go in a kind of hap-hazard way and trust to luck to bring them through somehow. This system does not pay, and we are surprised that any such person can feel offended when they are plainly told that their creditors are bound to have their rights in a proper and legitimate manner. The way to avoid such difficulties is to conduct business upon business principles, and one of the first of these is that a debtor should always make some satisfactory provision for his indebtedness if he desires to keep himself worthy of credit.

OUR NEW HIGHWAY TO THE NORTH-WEST.

The opening of the railroad from Prince Arthur's Landing to Winnipeg marks a new era in the development of our great North-West territory. Hitherto our roadway to the North-West lay through American territory, a torturous course and long, and one moreover hedged in by every Custom house monstrosity that the ingenuity of Yankee red tapism could invent. Indeed, it has often seemed to us, that if the American government had been in partnership with Chicago and St. Paul's merchants, they could not have acted more thoroughly in concert with them, and more ungenerously to their Canadian competitors for the North-West trade. As we pointed out some time ago, the only possible way to wholly overcome this state of affairs, is by the rapid construction of the Lake Superior section of the Canada Pacific road, which would give us an all rail route through our own territory. Until this is an accomplished fact, we shall always be more or less at the mercy of greedy and unscrupulous competitors, who will hesitate at nothing in order to keep possession of the great and growing trade of that wonderful fertile belt that belongs to us in the North-West.

The opening of the Thunder Bay section however, is a partial solution of the difficulty, in as much as it furnishes us with an all Canadian route for at least six months of the year. This is a boon which can only be fully appreciated by those who have experienced the delays and impositions incidental to the old route through American territory. In a conversation with Mr. Beatty, one of the proprietors of the North-West Transportation Company of Canada, he assured us that their Company are now making preparations to send passengers through from Sarnia to Winnipeg in forty-eight hours. They propose to leave Sarnia at about two o'clock in the afternoon, and making at once along the western shore of Michigan, reach the Sault Ste. Marie River in time to get through the canal before next night. This will give them the second night to run across Lake Superior, and thus enable them to reach Prince Arthur's Landing in about thirty-six hours after leaving Sarnia. The run by rail from the Landing to Winnipeg can, as soon as the road is properly ballasted, be made in about fifteen hours including stoppages. This will bring Toronto within three days of Winnipeg by an all Canadian route, and should materially aid in the development of our trade with the North-West. Hitherto one of the principal drawbacks to our successful prosecution of this trade has been the exorbitant rates charged for Canadian freight, and the delays incident to the imperfect organization and the equipment of some of the roads over which it had to pass. The rates over the new route should not exceed more than one-third to one-half of the former rates, and the saving of time should be equally as great. Looked at from any standpoint, whether national or commercial, the opening of this new Canadian highway is one of the most important steps that the Dominion has yet accomplished. One of the greatest drawbacks from a national point of view of the old state of things, was the habit the Americans had of tampering with our emigrants to the North-West, while *en route* through their territory. It is no exaggeration to say that hundreds of good emigrants that had been induced by Canadian emigration agents, and assisted with Canadian money to try their fortunes in the far away North-West, never reached their destination, on account of their having been induced by false representations made during their journey through the United States by American Agents to settle in that country. This not only resulted in a loss to Canada of the money that had been expended upon them, but of the prospective gain that any country in which they made their residence was certain to derive from their labors. As Canadians we are glad to know that this state of things will soon end, and that we shall soon be in a position to send our emigrants without any loss of time over our own route to our own prairie lands.

The opening of this new highway will no doubt increase the volume of trade between the Eastern Provinces and the North-West, and we trust that it may in addition tend materially to strengthen our evergrowing feeling of Canadian nationality and independence of our neighbors to the South of us.

CORRESPONDENCE.

The Editor does not hold himself responsible in any way for the opinions expressed by correspondents

To the Editor Trader :

Dear Sir.—We have read with surprise the letter of E. Freudenberg, jeweler, Ottawa, in your July issue, said letter purporting to be a necessary one of self-defence in reply to an article written in your June issue, under the head of Business Notes, which article you, no doubt, were prompted to write from current report caused by the legal action we had taken, owing to his mysterious disappearance from his place of business on

New Year's Eve last, and which was substantially correct in the facts therein stated, said article being printed, as you know, without our knowledge or instigation. Had Mr. Frendenberg left it there, we would not have found it necessary to make public the true state of affairs, as we are now compelled in our own self-defence to do. The particulars of the case are as follows: Mr. F. left his home and business last New Year's Eve, taking with him valuable stock and all the available cash he could secure. Mrs. F., his wife, in great distress appealed to the Chief of Police to have him make thorough search through the city, as she was not aware of his whereabouts or intentions. Detective McVeitty, who was deputed by the Chief to make search, could find no trace or clue of him, as Mr. Frudenberg, as afterwards transpired, was quietly making his way to Germany, and who would blame us for leaving his wife and family helpless, continued on his journey across the ocean, and not until his arrival did he deem it necessary to even let his wife know, let alone his creditors, of his whereabouts, and that she was left with any funds was no fault of his as he intended to take all. It appears his wife usually took charge of the money, and Mr. F. had induced her to place what cash she had, amounting to between $300 and $400, in their new safe, and pretending to lock the vault, gave her both keys, thus cunningly deceiving her into the belief that this money was secure in her own possession. The paper in which she kept the money wrapped in had in one end, some $50, all of like denomination, pinned up. Whilst she was absent, he easily took this money from the unlocked vault, and after abstracting all the money, as he thought, from the paper, dropped it on the floor and cleared. This paper was picked up by his little boy next day by mere accident, saving it from being swept out, containing still the $50 pinned in, and thus we are shown how it was he deliberately left sufficient funds at the disposal of his wife, and how it was that he did not take all available funds with him. This was the state of affairs we found things some seventeen days after his departure, and being his heaviest creditors, under the advice of our solicitors, found it necessary for our own security to attach the estate. The absurdity of his statement that he was not indebted to us one cent requires no reply, being amply borne out by the courts twice sustaining our action. The declaration he makes in reference to notifying his creditors is equally absurd, as that would be precisely what any right intending business man would do, especially when leaving only a wife and child behind him, his not notifying his creditors was bad enough in all conscience, but ten-fold worse was it departing unknown to his wife, leaving her in an agony of mind, to mourn his death for aught she knew. We might add at considerable length to this case, but have stated now more than sufficient to convince any reader that we were perfectly justified in the course pursued, and that his is one of he most disgraceful proceedings on the part of any man, without a feature of palliation or the faintest plea of justification. Much and more that we have stated is backed up by very strong affidavits, duly sworn and attested to, by the Chief of Police, Detective McVeitty, and seven jewelers of the City of Ottawa, who are all a unit in sustaining us in the course we pursued.

And with the words of righteous indignation indulged in in his closing remarks, we leave it to your readers to judge who was the cause of the action taken by us, and who it was that left his wife helpless and without means of support. None regretted more than ourselves the necessity of taking the steps we did to protect our property and the principles of business, which has not been without expense, loss of time and much annoyance.

Yours respectfully,

P. W. Ellis & Co.

Selected Matter.

THE SULTAN'S TREASURY.

The American ministers to Turkey and Austria, General Wallace and Mr. Phelps, "received permission—now very rarely granted—to inspect the Imperial Treasury, and were suprised at the amount of treasure in the vaults and the great number of precious stones displayed. There were forty officials in attendance," the dispatch went on, "who opened the locks with many formalities." Not the least curious of the anomalies to be noticed at Constantinople is the existence of this treasury, perhaps the richest in the world, while at the same time the Government is hopelessly in debt—bankrupt to all intents and purposes. Mr. Dwight, in his "Turkish Life in War Time" gives an interesting description of a visit to the Imperial Treasury at Constantinople, which is situated within the inner court of the Seraglio, in one of the heavy stone outbuildings of the ancient palace. One going thither from the city must pass through three massive walls ere he enters the court where stands the treasure-house, a building of dull gray stone roofed with lead, and having a single door of massive iron. A low, arched doorway leads to the interior, two connecting chambers, each about eighteen feet square, heavily vaulted and lighted by small windows with strong iron gratings. Round each room runs a gallery, and the wall space to the ceiling is occupied by glass cases, while in the centre of each apartment is a large glass show-case. There is a guard at the outer door, and at intervals of four or five feet all round the walls stand sentinels, mute and motionless, all clad in the everlasting black broadcloth and red fez introduced by the last of the great Sultans, Mahmoud the Reformer. One gallery is occupied with effigies of the Sultans, each in the robes and jewels and armor of the monarch as he lived. The dresses are mostly of silk brocade and cloth of gold, and many of the figures are weighed down with jewels and magnificent arms. Prominent among them is Mohammed II., the conqueror of Constantinople, who left the mark of his bloody hand high up on the pillar of what is now the mosque of St. Sophia; the hilt of his dagger is a single emerald, two inches long and half as large. All the figures save two wear the turban bedecked with diamonds, the exceptions being little Osman II., butchered in his boyhood, Mahmoud the Reformer, whose effigy is the last in the list. He appears in European broadcloth, with the red fez; the head-covering, however, being ornamented with a plume of bird of paradise feathers, caught up by a great spray of diamonds. Two thrones are in the outer room. One that of Nadir Shah, of Persia, is of fine, dark wood, delicately inlaid with pearl and ivory, and having a canopy of the same material, from which is suspended a great golden ball, decorated with precious stones. The other is about as splendid and uncomfortable a seat as could be devised. It is a platform about two and one-half feet square, with a

cushion of cloth of gold, embroidered with rubies, diamonds and pearls. Around three sides of the cushion is a low rail supported by miniature columns and standing some eight inches high ; it is of gold studded with clusters of rubies, and the whole throne is covered with plates of gold. In one cabinet is shown the state cradle of many sultans, which stand low on its rockers like those still in use in the East. The two ends rise a foot above the mattress, and are connected at the top by a bar running lengthwise as a support for a curtain. The whole is of solid gold, crusted on the outside with pearls, diamonds, rubies and turquoises. It would not be possible to describe in detail the contents of these rooms. "There are," says Mr. Dwight, "antique arms and armor, heavy with gold and jewels ; there are innumerable horse-trappings and saddles, covered with plates of gold and studded with emeralds, rubies, topazes, diamonds and pearls ; there are saddle-cloths embroidered with precious stones. Several sofa covers hang in the cabinets as background to the smaller articles ; they are worth $150,000 apiece, and are of heavy cloth of gold embroidered with seed pearls." There are bird-cages of gold, some with clocks face downward, at the bottom ; sacks of velvet embroidered with gold and pearls and diamonds ; "samplers" of red velvet on which texts from the Koran are embroidered in diamonds ; amber mouthpieces for pipes studded with diamonds and rubies ; vases of crystal, agate and onyx, many enriched with jewels ; inkstands and snuff-boxes innumerable, coffee-sets, tea-sets, knives, forks and spoons of solid gold, with jewels on their handles ; an immense array of clocks ; fans beyond counting ; umbrellas of white silk, exquisitely embroidered with gold and having for handles, matchless sprays of coral a yard long ; tea-sets of tortoise-shell as thin as paper. Mr. Dwight describes one toy—"a figure of a Sultan seated on his throne under a golden canopy ribbed with alternate rubies and emeralds, the whole structure being perhaps six inches high. The body of the figure is a single huge pearl ; the lower extremities are carved from a blue turquoise, and the turban is a solid mass of diamonds." "After every conceivable use has been made of the jewels, the surplus unmounted stones are gathered by handfulls into crystal bowls," in one of which are three uncut emeralds, the largest the size of a man's fist, and the smallest as big as a hen's egg. During the late war the Government pledged some of its jewels to the banks for a loan of $30,000,000. The bankers removed to their own vaults precious stones of value sufficient to secure the loan fully, yet the contents of the three small boxes left no appreciable gap in the great accumulation. Such is the treasure-house of the bankrupt ruler of a ruined nation. The Commander of the Faithful, it may be added, has at his disposition, under certain circumstances, a still more remarkable accumulation of wealth. This is the "Treasure of Islam," the offering of gold and silver deposited by many successive generations of pilgrims to the three Holy Places—the Caaba at Mecca, the vaults of the Mosque of Soliman at Jerusalem and the crypt of the tomb of Ali at the gates of Bagdad. The funds thus collected are designed solely for the defense of Islam in its extremity, and their guardians would yield them for no other purpose. According to tradition a Persian emperor during the sixteenth century, undertook to obtain possession of the treasure of the Tomb of Ali, but the force he sent to despoil the shrine was miraculously hindered, the soldiers' legs being stiffened almost into stone, so that they could not approach the sanctuary, and the spirits of the air, controlled by Soliman, are fabled to have concealed the treasures at Jerusalem during the occupation by the Crusaders. A contemporary calculator has placed the rate of accumulation at $600,000 a year, and the total value of the funds at $600,000,000 ; but these figures are by less enthusiastic authorities regarded as largely beyond the truth, and it is added that on several occasions in modern times the Sultan has drawn upon the funds for war expenditures. Nevertheless the "Treasure of Islam" must amount to many millions of money. —*Exchange.*

IRIDUIM IN THE ARTS.

Iridium is a metal that has long been known as possessing the quality of hardness in a high degree, and has been extensively used for the "diamond" points of gold pens. It has, however, been an intractable metal, difficult to work, and for this reason has been but little used. It remained for Mr. John Holland, the well known gold penmaker, of Cincinnati, to discover a process by which the metal is made available for use in the arts. For upwards of eighteen years he conducted experiments with iridium, with a view to making it more readily available for use for pen points. He has succeeded in producing, in fact, a new metal, which has a bright metallic color similar to that of hardened steel ; it takes a high polish, which does not tarnish or oxidize in the air ; it does not dissolve in the strongest acids or alkalies ; and it is harder than steel, agate, rock-crystal, and ruby. Iridium can be soldered to gold, silver, brass, copper, iron, steel and other metals. With these wonderful properties it can be adopted with great success for a multitude of mechanical uses and has already been applied to many with great success.

Iridium is found in considerable quantities in the platinum ores, in the forms of platiniridium, which is an alloy of platinum and iridium, and osmiridium or iridosmine, which is an alloy of osmium and iridium. The platiniridium occurs in grains, and sometimes in cubes with rounded edges. The iridosmine is usually found in the form of flat, irregular grains, and occasionally in hexagonal prisms. The geographical distribution of this metal is quite wide ; it is found in California, Oregon, Russia, East India, Borneo, South America, Canada, and Australia, and in small quantities in France, Germany and Spain. As usually found, iridosmine, or the so-called native iridium, is associated with numerous rare metals, viz.: osmium, platinum, rhodium, ruthanium and palladium, and also with iron and copper. Iridium possesses a white lustre resembling that of steel. In the cold it is quite brittle, but at a white heat is somewhat malleable. It is one of the heaviest of metals, having a specific gravity of 22.38. When an alcoholic solution of the sulphate of iridium is exposed to sunlight, it deposits an impalpable black powder, which has the very peculiar property of setting fire to a piece of paper saturated with alcohol when brought into contact with the slighest trace of it.

The iridium melted by the Holland process is compact and crystalline ; it is harder than the natural metal. The operation of sawing the metal is accomplished by means of a copper disc, making about 5,000 revolutions per minute, assisted by emery and water. When the metal is ground to a smooth

surface by means of emery on a copper wheel as described, it requires a good polish, which may be increased by using "crocus powder" afterwards on a similar wheel. Iridium which has been melted by Mr. Holland's process is nearly as hard as the ruby, which is next in hardness to the diamond. It cuts glass readily; the best files are ruined by attempting to file it. It has about the color of steel. It is not attacked by acids and does not tarnish. The best steel tools fail to make any impression upon it. A metal with this wonderful combination of valuable properties, will undoubtedly find many uses to which it can be applied with great advantage.

It has already been successfully applied to electric lights; for contract points for telegraphic instruments; for bearings for balances; for fine scales; for jewels for watches and clocks; for bearings for mariners' compasses; for stytuses; for drawing and ruling pens; for dental tools, etc. As iridium has a handsome, bright color, and is susceptible of a high polish, which does not tarnish or scratch, it promises to become an important factor in the manufacture of jewelry. Already it is being extensively used in combination with gold, silver and platinum, with which it alloys readily, in the production of sleeve buttons, pins, studs, etc. It is also used for jeweling watches, and promises to be more valuable than the ruby for this purpose. Watch cases will also be soon introduced made of iridium.

This metal is now produced by the American Iridium Company, of Cincinnati, and letters patent have been taken out for the United States, Europe and Canada. It can be produced in masses of almost any shape desired, and the company is now making it in a variety of shapes to fill orders from some of the largest manufacturing jewelers in the country. Unquestionably iridium has a promising future before it, and its adoption in the arts will be watched with interest.—*Jewelers' Circular.*

ENAMEL PAINTING.

Enameling is only done on gold and copper, silver swells up and causes blisters and holes in the coat of enamel. All enamel paintings are, in fact, done on copper or gold. The goldsmith prepares the plate that is to be painted upon.

The gold should be twenty-two carats fine; if purer, it would not be sufficiently stiff; if coarser, it would be subject to melt, and its alloy should be half white and half red—that is, half silver and half copper; whereby the enamel with which it is to be covered will be less disposed to turn green than if the alloy were entirely copper.

The workman must reserve for the edge of the plate a small fillet, which he calls the border. This ledge serves to retain the enamel, and hinders it from falling off when applied and pressed on with a spatula. When the plate is not to be counter-enameled it should be charged with less enamel, as, when exposed to heat, the enamel draws up the gold to itself, and makes the piece convex. When the enamel is not to cover the whole plate, it becomes necessary to prepare a lodgment for it. With this view, all the outlines of the figure are traced on the plate with a black lead pencil, after which recourse is had to the graver. The whole space enclosed by the outlines must be hollowed out so as to be of a depth equal to the height of the fillet had the plate been entirely enamled. This sinking of the surface must be done with a flat graver, as equally as possible; for if there be an eminence, the enamel would be weaker at that point, and the ground would appear. Some artists hatch the bottom of the hollow with close lines which cross each other in all directions; others make lines or scratches with the end of a file broken off square. The hatchings or scratches lay hold of the enamel, which might otherwise separate from the plate. After this operation, the plate is cleansed by boiling it in an alkaline lye, and it is washed first with a little weak vinegar, and then with clear water.

The plate thus prepared is covered with a coat of white enamel, which is done by burnishing a piece of enamel in an agate or porcelain mortar to a course powder-like sand, washing it well with water, and applying it in the hollow part in its moist state. The plate may meanwhile be held in an ordinary forceps. The enamel powder is spread with a spatula for condencing the enamel powder the edges of the plate are struck upon with this spatula. Whenever the piece is dry, it is placed on a slip of sheet-iron perforated with several small holes, which is laid on hot cinders; and it is left there until it ceases to steam. It must be kept hot till it goes to the fire; for, were it allowed to cool, it would become necessary to heat it again very gradually at the mouth of the furnace of fusion, to prevent the enamel from decrepitating and flying off.

The enamel plate, when cold, is to be washed in very dilute nitric acid, and afterwards in cold water, and a second coat of granular enamel paste is to be applied, with the requisite precautions. This, being passed through the fire, is to be treated in the same way a third time, when the process will be found complete. Should any chinks happen to the enamel coat, they must be widened with a graver, and the space being filled with ground enamel is to be repaired in the muffle. The plate, covered with a pure white enamel, requires always to be polished and smoothed with sandstone and water, particularly if the article has a plane surface; and it is then finally glazed at the fire. The painting operation now follows. The artist prepares his enamel colors by pounding them in an agate mortar, with a pestle of agate, and grinding them on an agate slab, with oil of lavender, rendered viscid by exposure to the sun in a shallow vessel, loosely covered with aguze or glass. The grinding of two drachms of enamel pigment into an impalpable powder will occupy a laborer a whole day. The painter should have alongside of him a stove, in which a moderate fire is kept up, for drying his work whenever the figures are finished. It is then passed through the muffle.—*Watchmaker and Jeweler.*

FIRE GILDING.

We are pleased to give our readers the following reliable formula for fire gilding, for which we are indebted to *Ackerman's Illustrated Zeitung.*

The story is told, that the King of Bavaria, Louis I., wishing to ornament the large hall in his palace with twelve colossal statues of his ancestors, cast in brass and plated with gold by the application of heat, sent his privy-councilor to Milan to confer with Manfredini, the most celebrated metallurgist in Europe at that time, as to the feasibilty of the undertaking. Manfredini's reply to the the councilor was: "If any one succeeds in gilding one of those colossal figures in the way you describe, without at least two men having lost their lives during the operation, I will cut off my own head."

King Louis, however, refused to be discouraged, and soon had the satisfaction of seeing himself surrounded by the

colossal statues, cast and gilded as he wished, without a single accident having occurred. As each one of the statues was successfully hoisted and placed upon its pedestal, the King used to say with a smile: "There goes another head off poor Manfredini!"

It is a strange freak of nature that gold, which resists the action of almost all acids, succumbs at once to the action of mercury.

If some pure gold is put into a crucible and melted, and then some mercury is poured into it, the two metals will immediately amalgamate. The molten mass, however, must be quickly transferred to a cooler vessel, or poured into cold water, as otherwise the mercury will evavorate, as it is unable to bear high temperature. When the amalgam is cooled it forms an alloy as soft and ductile as butter, and can be spread like paint upon any smooth surface. Any metal article plated in this way will look exactly like solid silver, owing to the presence of the mercury in the paint. To expel the mercury is the next process, and it is easily done by exposing the article to the heat of a very hot fire; the mercury evaporates, the gold sinks into the pores of the metal beneath, with which it becomes thoroughly amalgamated.

The mercury does not forsake the gold without a struggle; as it becomes more and more heated, tiny bubbles or beads appear on the surface, that must be immediately smoothed down or rubbed off with a horsehair brush, or the surface of the plating will be covered with small excrescences. When the mercury has entirely "vanished into thin air," there will remain upon the gold a precipitate or sediment, that must be brushed off; the article will be found plated finely and evenly with pure gold, having a very smooth, beautiful golden suaface.

The gold is of a very light color, but by gradually heating it several times, it can be toned down to any required tint. A reddish tinge can be given to it by coating it with gilders' wax, which is a mixture of beeswax, verdigris and hematite, and then heating it until the wax is burnt off, and the other ingredients are absorbed into the gold. A pale yellow tint can be obtained by washing the article, when the process of plating is entirely completed, with vinegar in which some verdigris, hematite and saltpetre have been dissolved, and then heating.

An exceptionally handsome frosted surface on the gold plating is obtained by spreading a paste over it, composed of four parts alum, eight parts saltpetre, two parts salt and one part pulverized glass. These ingredients are melted together in a crucible and spread upon the gold surface, which should also be well heated, while still boiling. As soon as it is well and evenly distributed, the whole article should be plunged into ice-cold water.

This process produces a frosted surface far more beautiful than what is usually seen, and equals, if it is not superior to, even the finest frosting ever done in Paris, where, as we all know, the manufacturers are famous for their exquisite frosted work.—*Translated for The Jewelers' Journal.*

RETURNING GOODS.

It is, we are aware, an enticing custom in certain departments of retail trade, to send merchandise to customers "on approbation." A lady can get an assortment of mantles or bonnets sent to her house for trial, the one which pleases her to be retained and the rest returned. Or paterfamilias can, if he sees a carpet which he fancies for his billiard room, have it sent home for the approval of his wife, to be returned if her taste does not agree with his. This may be legitimate enough; and sales are often effected by such means.

But it is a very different thing for a retail merchant in a country town 150 miles distant, to visit Hamilton or Toronto in March, buy a parcel of goods from an importer, and in April or May return a portion of them under the pretext that he has over-bought, or that trade is slack, or that he has "made a mistake." This may be a very convenient practice for the retailer, but is a nuisance to the wholesale dealer. Besides, it is not business. We have seen, in the letter-book of one wholesale house, a dozen transactions of this kind which have occurred this spring, and it appears as though, trade being slack, the country customer is taking advantage of the importer to throw upon his hands odds and ends of surplus stock, for it is practised upon a number of houses here.

One man sends back, on the 10th of May, certain pieces of dress goods amounting to $60, culled from a parcel bought by himself on the 7th April. Another coolly returns some $40 worth of fancy goods, which he professes to find "unsuited to his trade," as though his lack of judgment in buying them six weeks before could properly be visited upon the house which sold them. In isolated cases a merchant may take back a piece or two of stuff to oblige a customer; but that is a different matter from making a practice of returning goods at the whim of an inexperienced country dealer. The wholesale trade should not submit to it. The fact that the practice complained of exists appears to us to indicate over-trading, or an over-anxiety to humor the retail customer.

Retailers who know their business do not resort to such petty artifices. In the first place, they are unlikely to buy what they do not want; and if goods they have bought do not sell, common sense tells them that *they* must "grin and bear" the loss—not ask the importer to take a part of the load and do the grinning He is much more likely to do something more demonstrative. If an order be "stuffed" it serves the seller rightly to have the goods not purchased returned, and it is the receiver's business to return them promptly. So, too, if merchandise be imperfect or not as requested. But we regret to find instances where goods, shipped precisely as bought, have been returned on the flimsiest pretexts, or without any complaint being made. This, too, after having been kept a month, damaged, fly-blown, the packages frayed or covering torn. Such a proceeding argues a reliance on the good nature of the wholesale dealer that is child-like. Indeed, such modes of doing business are too childish to be submitted to, and we trust they will not be longer encouraged. —*Monetary Times.*

THE STORY OF A WATCH.

Thirty-one years ago a gentleman now occupying a prominent place in Masonic circles in San Francisco, Cal., then residing in an interior county of the State, sent an order to London for the manufacture of a fine gold watch, of English make, a duplex movement, heavy gold magic cases, and appropriate scroll work. During the following year, the watch, a masterpiece, costing $100, was received and worn by its owner for the next nine or ten years. In 1861 a friend started for this city on a visit, bringing the watch with him, since which time nothing has been seen or heard of him, the supposition being that he was murdered and plundered by some of the bad characters that

were so prevalent in San Francisco at that time. The missing man had abundant means, and left behind him a piece of mining property worth $30,000 or $40,000, which, by the lapse of time and the local mining laws, passed into other hands, showing conclusively that at least some accident had overtaken him. The owner of the watch mourned the loss of his friend, and regretted the missing time-piece. After some years he moved to San Francisco, where in time the above incidents became to memory as a dream. A few days ago he was conversing with a friend in a jewelry store, when a stranger stepped up alongside of him, laid a watch on the counter and asked the proprietor to purchase it, and, to the astonishment of our masonic friend, he recognized at the first glance the time-piece he had lost 21 years previously, and immediately claimed it. The stranger explained that he was disposing of the watch for a lady in destitute circumstances, and naturally insisted upon having some proof of the claimant's ownership before recognizing the claim. The two, by agreement, went to another jewelry establishment, the proprietor of which had formerly been in business in the same interior town with the claimant, and who had cleaned the watch once or twice twenty odd years before. The watch was handed him, and before any thing had been said in reference to it he said, "Why,——, this is your watch; the one you lost." Another friend who had last seen the watch in 1856 recognized it at first sight. Subsequent investigation revealed that about 1861-2 a gentleman of San Francisco purchased the watch of a man, possibly one who had murdered the visitor from the interior, for $350 and had carried it up to the day of his death, which occured in the Tucson, Arizonia, about a year and a half ago. In the settlement of his estate the watch was appraised at the low valuation of $125, and the sister of the deceased, knowing it to be valuable, took it as a portion of her interest in the property. Becoming reduced in circumstances, she put it in the hands of a friend to sell for her, with the result as above told. Not wishing to involve the lady in legal proceedings, and sympathizing with her destitute condition, the pleased owner of his newly found treasure magnanimously paid her $100 for the return of his property, which was found to be in as good condition as the day it was bought.—*Exchange.*

CURIOUS TIMEKEEPERS.

An American traveler once saw a rare Japanese timekeeper, which had been described in an old record. This clock, in a frame three feet high and five long, represented a noon landscape of great loveliness. In the foreground were plum and cherry trees, and rich plants in full bloom; in the rear a hill, gradual in ascent, from which flowed a cascade admirably imitated in crystal. From this point a thread-like stream glided along, wandering in its windings rocks and tiny islands, but presently losing itself in a far-off stretch of woodland. In the sky turned a golden sun indicating as it passed the striking the hours, which were all marked upon the frame below, where a slow creeping tortoise served as a hand. A bird of exquisite plumage resting by its wing proclaimed the expiration of each hour. When the song ceased, a mouse sprang from a grotto near by, and running over the hill, hastily disappeared.

In the South Kensington museum, at London, is a small watch about one hundred years old, representing an apple, the golden case ornamented with grains of pearl. Another old Nuremburg watch has the form of an acorn, and is provided with a dainty pistol, which, perhaps, serves as an alarm.

In London in an eagle shaped watch, within which, when the body of the bird is opened, a richly ornamented face is seen. They are sometimes found in the form of ducks, geese and skulls.

The Bishop of Ely had a watch in the head of his cane, and a prince of Saxony had one in his riding saddle.

A watch made for Catherine I. of Russia is a repeater and a musical watch. Within is the holy sepulcher and the Roman guard. By touching a spring the stones move away from the door, the guard kneels down, angels appear, and the holy women step into the tomb and sing the Easter song that is heard in all the Russian churches.

King George III of England had a watch not larger than a five cent piece, which had 120 different parts, the whole not weighing quite as much as a ten cent piece.

Clocks and watches must usually be wound up every day, though some clocks will run eight days without winding, and a few even longer than that. But there was a century clock at the great Centennial exhibition at Philadelphia. The man who made it says it will run a hundred years without winding, though it is hard to believe this.

There was another curious kind of a clock at the Centennial. It was fixed in a carriage, and tells just how many times the wheel turns round on a journey, and how many miles have been traveled, and how long the carriage has been in making the trip.—*Exchange.*

PRECIOUS STONES AS SYMBOLS.

The months, like the apostles, are symbolized by precious stones:

January, the jacinth or hyacinth, sometimes the garnet. The garnet stands for health and joy, and is also an emblem of constancy.

February, the amethyst, emblematic of sobriety and peace of mind. It is dedicated to Venus, notwithstanding its sober tendency. In the zodiac it stands for Sagittarius, and in metallurgy for copper.

March, the blood stone, emblem of courage and presence of mind.

April, the sapphire, and diamond standing for repentance and innocence. The first stone was thought to produce somnambulism and inspire the wearer with holy faith in all sacred things. In the zodiac it represents Leo. The second stone gives us spiritual ecstacy, trance and visions. In the zodiac it belongs to Virgo.

May, the emerald, success in love. In the zodiac it stands for Cancer.

June the agate, emblematic of health and long life. The agate was believed to quench thirst, and when held in the mouth, to allay the violence of fever. The ancients declared that it would render the wearer invisible. In the zodiac it represents Scorpio.

July, the cornelian, symbolizing a contented mind and a good memory.

August, the sardonyx or onyx, emblematic of conjugal felicity. Rabbi Benoni, of the fourteenth century, tells us that the onyx is a dangerous stone, for it contains a little demon which comes out of it at sunset and fills the mind of the wearer with disturbing dreams. The parings from the nails of Venus fell into the Indus and were changed to onyx.

September, the chrysolite, emblematic of *Mens sana in carpore sano.*

October, the aqua-marine, opal, and beryl, standing for hope.

November, the topaz, emblematic of fidelity and friendship.

December the torquoise or ruby,

JOHN SEGSWORTH & CO.,

WHOLESALE IMPORTERS OF

Watches, Jewelry, Etc.,

NO. 23 SCOTT STREET.

Canadian Wholesale Agents For

AMERICAN WATCH CO.,

Waltham, Mass.

"LONGINE" WATCH CO. "AGASSIZ" WATCH CO.

TORONTO, AUGUST 1ST, 1882.

It is with great pleasure that we take this opportunity to thank our numerous customers throughout the country for their kind patronage during the past half year; also to inform them that our Mr. J. Segsworth is at present in Europe where he is engaged in selecting a very complete and well assorted stock for the Fall Trade, which, if we may trust indications, will be very large.

From the facilities which we have of buying for CASH, thus securing the lowest possible prices, also from Mr. Segsworth's well-known reputation as a close buyer, we will be able to offer our Goods at the lowest possible figures.

It only remains to be said that this Fall we will show the largest and most complete stock in the Province, which it will be to the advantage of every Jeweler in the country to see. Wishing one and all a very prosperous business this Fall.

We remain, yours truly,

JOHN SEGSWORTH & CO.

symbolizing prosperity and great success. The torquoise pales when the fortunes of its owner wane. The ruby was believed by the Burmese and Hindus to ripen like the mango. They described it as turning successfully yellow, green, blue, and, last of all, brilliant red.—*Watchmaker and Metalworker.*

THE BRAZILIAN DIAMOND MINES.

These mines lie in the province Minas Geraes, a depression surrounded by mountains. Admittance is strictly prohibited and only granted in very exceptional cases, and the narrow passes leading to the mines are guarded by soldiers. The yield has lately much decreased, and only about 1,000 workmen (about one-third of those formerly employed) are at present occupied with diamond washing. Negroes are exclusively employed, and although the number of overseers is very large, the former understand to cheat the latter with much adroitness. The stolen diamonds are sold to smugglers who venture into the mines under the cover of the night, and at the risk of life, remaining hidden for days in the cabins until a chance is offered them to slip out unobserved. The condition of the negroes is pitiable; they receive a mere pittance for this work, and are compelled to labor till night, without interruption or meals. They stand in water all day, constantly exposed to the danger of being buried by the cavings of the banks, and many other dangers; yet they perfer this work to any other, in view of the money they may procure from the sale of a stolen diamond, or in hopes of their manumision, should they happen to find a diamond of thirteen or more karats. If a negro has found a diamond, he must raise it between thumb and first finger, show it to the supervisor, and then place it into a box suspended from the roof of the wash house. At night the box is handed to the special administrator, who weighs the diamonds, and puts them into a bag, which he constantly carries about him. They are handed to the treasurer at the end of each month, who again weighs them and notes it in his books. They are sorted annually, being sifted through twelve differently meshed sieves, put into twelve bags, packed in a box, which, having been sealed by the three highest officials, is sent under military escort to Villa Rica, and thence to Rio de Janero. At Villa Rica, the list again is sealed by the general stationed there.—*Exchange.*

A CURIOUS CLOCK.

The Rutland *Herald* says Mr. S. Holton, a jeweler and watchmaker of Middlebury, Vermont, has recently constructed a curious clock, which acts out to perfection the assassination of President Garfield. The machine is a common cuckoo clock under which is a miniature depot. At one window is a ticket agent dealing out tickets, while at another a telegraph operator is seen busy at his work, and truckmen, porters, train despatchers, etc., are all flying around as natural as life. All of these figures are of wood, about two inches long. At the end of each hour the cuckoo announces the fact, and immediately Garfield appears on the platform, accompanied by Mr. Blaine. Guiteau is seen to follow him, having just alighted from a truck waggon, and as he fires at the President the latter falls. Just then a train of cars comes dashing in, and in the confusion all the principal actors re carried into the depot out of sight. After the train despatcher has given the signal and the train has gone, a small door at the left opens and a priest appears, book in hand, in the act of reading a funeral service, while at the same time another door at the right opens and Guiteau appears on the gallows. The priest retires, and shortly after the gallows disappears with Guiteau and the doors close. This is acted out at the end of each hour, and takes three minutes. Mr. Holton is quite a noted inventor, but this seems to be his masterpiece, and has to be seen to be fully appreciated.

BUSINESS CHANGES FOR JULY.

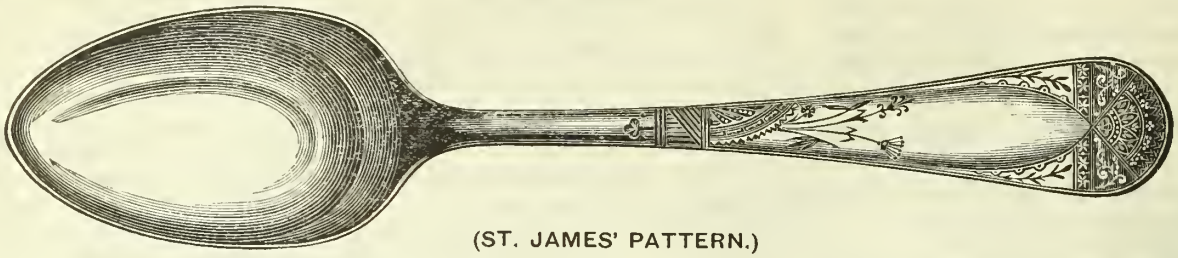
E. Maycock, Woodstock, Ont, Fancy Goods, has sold out; Chalmers & Carney. Emerson, Man., Hardware, sold out to Cooper & Co.; G M. Butchart, Owen Sound, Hardware, damaged by fire; P. Wilker, New Hamburg, Hardware, sold out to Brodricht & Feik; W. B. Stephens, Owen Sound, Hardware, burnt out; M. Forhan, Owen Sound, Jeweler, burnt out; Woltz Bros., Jewelers, closed their Winnipeg branch; J. W. Keetch, Orangeville, Jeweler, removed to Chesley; R. H. Gordon, Ridgetown, Jeweler, skedaddled; John Bertram, Hardware, sold out to M. Miller.

BUSINESS NOTES.

Mr. W. G. H. Lowe, of the firm of Zimmerman, McNaught & Lowe, of this city returned from his European trip last week. His jewelry purchases are also to hand, and the firm are of the opinion that tney will this fall show one of the best assorted stocks in Canada. They invite the retail jewelry trade generally to give them a show.

In a lacrosse match between employees of Messrs. Smyth & Fulger, and Messrs. W. H. Bleasdell & Co. last week, the former won.

R. H. Gordon, a jeweler in a small way at Ridgetown, Ont.; who moved thither about a year ago from Tilsonburg, where he had borne a good character, has gone from the gaze of his creditors.



As will be seen from our advertising columns, Mr. John Segsworth, the well-known wholesale jeweler of this city, is at present in Europe on a purchasing tour for his firm. We wish him a successful trip.

Mr. John Zimmerman, senior partner of the well-known jewelry house of Zimmerman, McNaught & Lowe, is at present *en route* to Winnipeg. He carries with him a large stock of the newest lines of English and American jewelry, also the special lines manufactured by the firm themselves. He will probably stay in Winnipeg till about the middle of August, so that any customers in the North-West desiring to do so can have an opportunity of examining his stock.

Our readers will be pleased to learn that Mr. John Inglis, the well known and respected traveller for Vidal & Co., of Montreal, has, n conjunction with Mr. Picard, their bookkeeper, bought out the business of their late employers, and is now carrying it on under the style of Inglis, Picard & Co. Mr. Inglis has been so long and favorably known by the jewelry trade of Canada that it would be superfluous in us to attempt to make mention of his many good qualities. He is a good fellow, and we wish him and his partner the utmost success in their new venture.

The old adage "the course of true love never runs smooth" was amply verified in the experience of a jewelry traveller hailing from this city, a few days ago. It appears that the traveller had fallen in love with the daughter of a hard hearted express agent some where up North, and finding that he was not likely to get the stern parent's consent, iuduced the damsel to elope with him. Although they fled as fast as steam could carry them they failed to get ahead of electricity, and a telegram from the stern and wrathy parent caused their arrest. They were locked up in an hotel for a few hours, until the father could be communicated with and finally brought to reason, the result being that they gained his consent and were lawfully married in the usual orthodox fashion. If the old gentleman is satisfied, the young couple certainly are, and we wish them happiness and prosperity in their wedded life. All's well that ends well.

Bogus Canadian Gold.—A case that has excited a good deal of attention among manufacturing jewelers in this country has just been decided by one of the Judges on the Chancery Division of the High Court of Justice. The action was brought by Messrs. Levelus Brothers' manufacturing jewelers of Birmingham, to prevent a Mr. Ellis Newton, who describes himself as 'The American Auctioneer," from selling watch chains and other jewelry as "Canadian" gold. The plaintiffs—one of whom was for some time resident of Montreal—urged that the term "Canadian gold" was a fancy name used in the market to designate imitation gold jewelry of their manufacture. 'Canadian gold" was, they claimed an amalgam, the secret of which was known only to themselves. His Lordship, however, pointed out as it was a matter of common knowledge that gold was found in Canada, and any ordinary person would imagine that "Canadian gold" was really gold that had come from Canada, he must dismiss the case, and he accordingly did so.

Manufacturers of

FINE SILVER PLATED WARE.

(GENEVA PATTERN.)

INCLUDING THE WM. ROGERS'

SPOONS, FORKS, KNIVES, ETC.,

MADE IN

EXTRA, DOUBLE, TRIPLE; ALSO IN SECTIONAL PLATE.

Extra Plated upon all points most exposed to wear.

STAMPED "WM. ROGERS X12."

FACTORIES:

WALLINGFORD, U.S. — AND — **MONTREAL, CANADA.**

The Wm. Rogers' Goods sold by us are made under the supervision of Mr. Wm. Rogers, formerly of Hartford and West Meriden, son of the old original Wm. Rogers, who died in 1873. Please do *not* associate us with goods made in Hartford, Ct., with which we have no connection. We make all the goods we sell, and have our own especial patterns.

SIMPSON, HALL, MILLER & CO.

WORKSHOP NOTES.

Grease spots in paper are first dampened with a fine camel's hair brush dipped in rectified spirits of turpentine, which, when dry, is completely removed by applying a little alcohol.

German Silver of a very fine grain and excellent quality is produced by melting in a crucible 55 parts copper, 23 nickel, 17 zinc, 3 iron and 2 tin. This alloy is equal to silver, of the same hardness, and not vitreous.

To Protect Steel.—After having cleaned the iron or steel article, anoint it with a solution of wax in benzine, using a fine camel's hair brush. By this treatment articles exposed to acid vapors may be protected against rusting, tools, etc.

Nickel-plated brass or iron, which has become coated with burned grease and dirt, may be cleaned without injury to the nickel surface, by boiling in a strong solution of soda or potash, rinse in water, and rub first with moistened and then dry rouge or chalk.

It is sometimes necessary to bore one or more holes in porcelain, but the usual way of doing this is not easy. If, however, an ordinary drill be hardened and and kept moist with oil of turpentine, it will easily penetrate the porcelain. The drill commonly employed in connection with scroll-cutting machines answer very well.

Good Cement.—Stir to a thick batter with silicate of soda, 12 parts Portland cement, 6 parts fine sand, 1 part infusorial earth. Very excellent for marble and alabaster. The cemented object need not be heated. After 24 hours, the fracture is firm and the place can with difficulty be found.

Recovering Gold from Galloons.—Previously boil the galloons for a short time with pure wood lye or solution of potash, intensified with calcined lime. When all the gold or silver spun silk threads are dissolved, wash the remaining metals several times with pure water, and collect upon a filter of blotting paper.

Quickly Prepared Cement.—Break an egg and empty its contents; add to the small remainder in the shell the point of a penknife full of white lead, and with your finger stir it into a batter. Slightly warm the fractured faces, and apply the cement. The piece will adhere very firmly after twelve or fourteen hours.

Another coating may be made if the steel or iron is covered with a layer of a mixture obtained by boiling sulphur with turpentine oil; this evaporates and leaves the sulphur upon the surface as pure sulphur, which again combines with the metal and forms sulphuret of iron, by heating the articles, if small, over a gas or alcohol flame.

Varnish for writing on glass may be made of 500 grains ether, 30 grains sandarac and 30 grains mastic. Dissolve and add benzine until the varnish imparts to glass a roughened appearance. Use cold.

The teeth of the anchor escape wheel of watches should receive a little oil. By steel forks, many watchmakers give a little oil to the ruby pin, to prevent the rusting of those steel parts; none is given, however, to those of aluminum, bronze, brass or gold.

A new method of tempering steel has been published by M. Clemandot. The metals are heated to a cherry red. and then compressed strongly until they are cold. The result is great hardness and an exceedingly fine grain. Steel thus treated makes excellent permanent magnets.

To obtain gold from old watch plates, take equal quantities of saltpeter and borax, and dissolve in a small quantity of water. Next glow-heat the gilt pieces and plunge them into this solution. By repeating this several times, the gold will loosen and precipitate in the fluid.

Soldering cast iron, says the *Engineer*, is generally considered to be very difficult, but it seems to be only a question of thoroughly making bright the surface to be soldered, and using good solder and a clean swab with muriatic acid. Sodium amalgam might be usefully employed for the purpose.

Gold Varnish for Metals.—Dr. Kaplas has found in picric aud boric acids a gold varnish for metals, giving at once a firm and handsome surface. He recommends a clear solution of shellac in alcohol, with an addition of picric acid, and about ½ per cent. of boric acid.

Steel which has rusted can be cleaned by brushing with a paste composed of ½ ounce cyanide potassium, ½ ounce castile soap, 1 ounce whiting, and water sufficient to form a paste. The steel should first be washed with a solution of ½ ounce cyanide potassium in 2 ounces of water.

A cement that resists acids is made by melting 1 part India rubber, with 2 parts linseed oil, and add sufficient white bolus for consistency. Neither muriatic nor nitric acid attack it; it softens a little in heat and its surface does not dry easily; which is produced by adding 1/5 part litharge.

Steel tempered in oil is not as hard as that in water; softer in tallow than in oil; softer in sealing wax than in tallow. Small drills hardened in sealing wax require no annealing; very thin ones may be tempered by drawing them with a quick motion through the air; they also need no annealing.

Sweaty Hands.—Immerse your hands in freshly drawn well or spring water, and leave them therein until chilled; the evil of perspiring hands may thus be removed in about two weeks. The gentlemen who recommends above treatment says that he has handled polished steel on the hottest summer day since, without even leaving the imprint of his fingers thereon.

It is very injurious to expose a watch or movement to the heat of the sun for any length of time, especially when lately cleaned and oiled—the oil evaporates and becomes viscid. The generated vapors will stick to the train and give it a dull, dark look. It sometimes occurs in anchor watches that the shellac will soften and cause the pallets to loosen; wherefore it is necessary to protect the watch as much as possible against the sun.

To color iron and steel brown, dissolve in four parts water, 2 parts chrystalized chloride of iron, 2 chloride of antimonium, and a trifle of tannic acid, and apply this mixture with a cloth or sponge upon the surface, then let it dry. Repeat the application, according to the depth of the color desired. This coating fully protects the steel against humidity. The chloride of antimonium should be as little acid as possible.

Grease Spots in Marble.—Saturate carbonate of magnesia, previously heated to remove every trace of mechanically adhering humidity (still better is freshly calcined, cold magnesia—the so-called magnesia usta) with sufficient pure benzine, that it imbibes without parting with an excess, which only must occur upon being pressed together. Throw a sufficient quantity of this matter upon the provoking grease spot, and rub it upon the place. Perform this operation several times, and the spot will have completely disappeared.

Protection of Polished Brass.—To protect polished brass against dimming, it must be coated with a transparent varnish. Such a one consists of one part white shellac and 5 parts alcohol; or, one part shellac, 1 mastic, and 7 alcohol; or, 8 parts shellac, 2 sandarac, 1 Venetian turpentine, and 50 parts alcohol; or, 12 parts sandarac, 6 mastic, 2 elemi, 1 Venetian turpentine and 64 alcohol. The articles, before being varnished, must be well cleaned, and no more be touched by the hand, and heated to about 75° C.

To Perforate Glass.—To perforate glass by electricity, Fayes, (*Chem. Zig.*) makes a sheet of hard caoutchouc, 18 cm. long and 12 cm. broad, for a battery of 12 cm. spark, runs a brass wire through it, and fastens it with a screw. The wire end he moistens by a few drops of olive oil, places the glass plate upon it, and passes the current conduit of the other pole over the glass. The spark is then permitted to pass through the glass. By drawing the glass plate slowly over the caoutchouc, many small holes, closely situated together, are obtained, and the glass may be broken in their direction.

This is Mr. A. A. Common's receipt for the silvering of glass: Solution 1—Nitrate of silver, 1 ounce; water, 10 ounces. Solution 2—Caustic potash, 1 ounce; water, 10 ounces. Solution 3—Glucose, ½ ounce; water, 10 ounces. The above quantities are estimated for 250 square inches of surface. Add ammonia to solution No. 1 until the turbidity first produced is just cleared. Now add No 2. solution, and again ammonia to clear; then a little solution, drop by drop, until the appearance is decidedly turbid again. Then add No. 3 solution, and apply to the clean surface. A film was obtained in 43 minutes at a temperature of 56° Fahrenheit.

Lyons Gold, or Tombac.—According to Prof. Dr. Bottger, Frankfort, brightly scoured or polished copper articles, if immersed in a boiling concentrated solution of caustic soda, in which so-called tin grey, that is finely powdered metallic zinc were boiled for some time, with an excess of the former, in the alkaline zinc solution, becomes coated with a mirror-lustrous layer of metallic zinc. If an article thus coated, in a dry state, is dipped into olive oil, heated to 120° to 140° C., or sand of the same temperature, the zinc coat will unite with the copper base, and produce the gold colored alloy known by the name of tombac, or Lyons gold.

Cleaning Mat Gold Articles.—For cleaning mat gold articles that have become blackened by exposure, I would recommend a solution of 60 grams carbonate of soda, 30 g. cloride of lime, 15 g. table salt, and ½ quart water. It is best to restore the lustre either of bright or mat gold. Another recipe gives different proportions: 80 grams cloride of lime, 80 g. bicarbonate of soda, and 20 g. table salt; dissolve these ingredients in 3 litters distilled water. For cleaning an article, lay it into a porcelain dish, cover it with the fluid, and if difficult to clean, heat the latter; next rinse in alcohol and dry in sawdust. The fluid used is no longer good. Store the remainder for use, in glass bottles.

14 AND 18 KARAT GOLD WATCH CASES,

MANUFACTURED BY

THE AMERICAN WATCH CO.,

OF WALTHAM, MASS.

All Cases of our Manufacture are Stamped (A. W. CO.) which indicates that they are manufactured by the American Watch Company.

We are informed that cases are offered to the trade stamped W. W. Co. This is evidently done with the intention to deceive and further the sale of inferior cases. There is no Waltham Watch Co., but the name is used by us as a registered trade mark on a well known grade of movement.

AMERICAN WATCH CO.,

ROBBINS & APPLETON, - General Agents,

NEW YORK.

SCIENCE NOTES.

BELOW is a list of certain alloys of different colors, such as occur often in the practice of the jeweler.

18 karats, red : Fine gold, 750 parts ; red copper, 250.

18 karat, rose: Fine gold, 750 parts; fine silver, 50 ; red copper, 200.

Green : Fine gold, 750, fine silver 250.

Gray: Fine gold, 750, iron filings, 250. These must be stirred into melted borax, and quickly added to the melted gold. Give much heat.

17 karats, red : Fine gold, 655 ; fine silver, 200 ; copper, 145.

15½ karats, 18 karat color: Fine gold, 635; fine silver, 200 ; copper, 165.

14 karats, common: Fine gold, 560; fine silver, 200 ; copper, 240.

13 karats, red : Fine gold, 540 ; fine silver, 150 ; copper, 310.

13 karats, white : Fine gold, 540 ; fine silver, 300; copper, 160.

9½ karats, reddish color : Fine gold, 392 ; silver, 150 ; copper, 458

To preserve in low-grade golds the color of 18 karats, the alloy to be added must be in equal parts.

EXPORT.—The Grand Duchy of Baden, during 1881, exported watches and watch material to the value of M. 23.068 to the United States. The value of gold ware amounted to 39,902 marks.

TIME OF NIGHT.—Many large cities, as is well known, are poor in illuminated clocks, whereby to know the time at night. Antwerp, Holland, has lately had a clock inserted into each street corner lamp post, whereby the passer is enabled to know the time.

A DISTRACTED HOROLOGIST.—The *Revue Chronometrique* speaks of a watchmaker who sits in his shop surrounded by clocks awaiting to be regulated. and ticking away in a manner understood only by non-regulated timepieces. He suddenly remembers an appointment at four o'clock. The day wanes, and inquietude seizes him, so, rushing out on the street he inquires of the first passer-by, "What time is it, if you please?"

RECENTLY while Dr. A. H. Best, of Savannah, Ga., was silverplating a small article with silver cyanide solution, he used an old Spanish silver coin as anode. The coin was worn perfectly smooth, aud had been hammered to twice its original size ; yet in a little while after it was put in the bath, every letter and figure became plainly visible. The date, 1800, though defaced so as to be beyond deciphering with a powerful glass, became plain.

AN INVENTOR, whose name was known to but a handful of the present generation, but of whose discoveries was of revolutionary importance has just died—David Thomas, who in 1837 invented the process of smelting with anthracite. Mr. Thomas was a Welshman, born in 1794. His first anthracite furnace was set up at Catasaqua, Pa., and from that beginning the industry has progressed till last year 5,000,000 tons of iron were melted with anthracite. The State of Pennsylvania owes more to this man than it ever owed to William Penn.

THE PARIS correspondent of the *Nature* lately inspected at Feil's workshop, the large flint glass disk which has been cast for the Lick Observatory in California, and purchased by the Trustees for $10,000. It is now on its way to Clarke's for polishing. Its diameter is 97 centimeters, its thickness 55 centimeters, and its weight 170 kilogrammes. The casting occupied four days, duriug which eight tons of coal were consumed. The cooling of the mass required 30 days. The optical tests showed that the glass was perfect in all its parts. At the time the correspondent wrote, the crown-glass disk was cast, and the process of cooling was going on.

MAT BRUSHING.—The fine wire matting-brush should run at a speed of about 2,500 revolutions a minute, while brushing, rain water, or sour beer mixed with water, or a juice derived from boiling liquorice wood in water, should drop on the place where the brush strikes the work, and occasionally a piece of sand paper held against the brush. When the wire points are too straight, let them strike over a piece of wire, take care not to hook the points too much, which would prevent matting. Keep the brush in good order constantly, and when the wires become tangled or form knots, they should be separated or knotted brushes cut out. When the work is matted, brush it in soap-water with a soft hair-brush, then rinse in warm water, containing a little spirits of ammonia and caustic potash, lay it for awhile in pure alcohol, and finally dry off in sawdust.

The Watchmaker, Jeweller and Silversmith,

A Monthly Illustrated Journal. Published in London.

The Representative Organ of the Watch, Jewellery and Kindred Trades in the United Kingdom.

It is full of original information and thorough practical instruction contributed by the leading writers on the various subjects connected with the above trades. The text is well illustrated by wood-cuts, and two supplements of artistic designs for jewellery, etc. accompany each number.

This important Trade Organ, now in its seventh year of publication is in the hands of every British Watchmaker, Jeweller and Silversmith, and is therefore a most valuable medium for manufacturers requiring publicity in Great Britain.

Our list of permanent contributors includes such names as : J. U. Poole, Richard Whittaker, Henry Ganney, Moritz Grassmann, J. Herrmann, E. J. Watherston, W. H. Singer, an ample guarantee for the sterling value of the journal. Subscription 5s. per annum.

Published by A. FISCHER, 11 Saint Bride Stree . London, E. C., England.

NICKEL

SHOW CASES FOR SALE.

In consequence of their removal the undersigned have For Sale Very Cheap, Five First Class Nickel Show Cases, made by Millichamp, of Toronto. The Cases are square shaped, 12 feet long, 30 inches wide, and 20 inches deep, with Handsome Stained Stands. Are suitable for Fancy Goods or Silver ware. Cases and Stands cost $116. Will be sold for $80 cash.

Can be seen at the Wharehouse of

ZIMMERMAN, McNAUGHT LOWE,

6 WELLINGTON ST. EAST, TORONTO.

THE WATCHMAKER

And Metal Worker

Is the official Journal of the

Watchmakers and Jewellers,

of the North west,

CONTAINING 56 PAGES OF

Illustrations and Reading Matter.

Whose columns are replete with choice articles upon Horology, Watch-making and repairing, written for this Journal by practical and scientific men ; also a large amount of general information of vital importance to the trade ; also continued articles, or lessons in letter engraving, written by a celebrated engraver of this city. Subscription price, $2.00 per year. Single copy, 20 cents.

THE LARGEST

Clock House

IN CANADA.

I beg to direct the attention of the Trade to my large assortment of Clocks, from the following celebrated manufacturers, viz.:

SETH THOMAS, WELCH.
GILBERT AND ANSONIA,
INGRAHAM

I keep these Clocks in every style now manufactured, and show 200 different varieties of samples, besides Regulators of all kinds.

I will sell, only to the Trade, any of the above makes of American Clocks at prices lower than any house in Canada, and will guarantee to meet any competition either in quality, style or price. Also a large variety of Ladies and Gent's Swiss Watches, Gold, Silver and Nickel Cases, Key and Stem Winders.

SAMUEL STERN,

Sole Agent for SETH THOMAS' CLOCKS,

31 Wellington, 40 Front st. E., Toronto.

SPECIAL NOTICE.

To ensure insertion, changes or new advertisements must be sent to the office not later than the 27th of each month.

Editorial.

PROGRESS.

With this number "THE TRADER" commences the fourth year of its existance, and we trust that it may not be out of place for us to draw the attention of its readers in every part of the Dominion of Canada to the great improvement that the present issue shews over its initial number.

When the paper was launched, we stated in our first number "that we hoped that the advertisements would defray the cost of publication, and by distributing it free to every Jeweler and Hardware Dealer in Canada, it would fill a long felt want, by affording a sure and inexpensive means of interchanging the ideas between the wholesale and retail trades."

Although looked upon as chimerical by the knowing ones in the newspaper business, we are glad to say that our anticipations in regard to this part of its mission have been fully realized, and although THE TRADER has not yet reached the goal for which it set out, it has shewn a steady and satisfactory progress in that direction. The first number of THE TRADER was an eight page paper, five of which were advertisements and three of editorial and selected matter; our last issue contained ten pages of advertisements and ten of editorial and selected reading matter, in all, twenty pages, or two and one-half times the size of its original number.

The outward appearance of the paper has been greatly improved by the addition of an expensive colored cover, while the general excellence of the typographical work has been such as to evoke expressions of praise from practical printers.

We have aimed to furnish our readers free of charge, a paper at once readable and instructive, and the many flattering encomiums that we have received from different parts of this vast Dominion seems to indicate that our efforts have not only been successful, but they have been thoroughly appreciated.

We have at various times published selections from our exchanges, written by some of the greatest of living horological writers, and we may say without any egotism, that there is not a jeweler in this country who cannot find some useful as well as interesting information in any of our numbers.

We should be pleased to have the Jewelry trade use our columns freely for the interchange of their ideas upon trade or mechanical topics, and we are of the opinion that if such things were more frequently discussed and thoroughly ventilated, much practical good would result therefrom.

Any one taking up one of our American Horological contemporaries cannot but be struck at the large number of intelligent and thoughtful contributions from practical men upon all conceivable subjects connected with the mechanical construction of our present time keepers.

That this interchange of ideas among practical watchmakers can result in other than good cannot be doubted for a moment, and we trust that the attention of our Canadian Craft have only to be drawn to this subject in order to ensure their taking advantage of it to the fullest extent. They may rest assured that if THE TRADER can do anything to further this interchange of ideas by giving them space, its columns shall be freely placed at their disposal for that purpose.

In conclusion, while apologising for saying so much about ourselves, we have only to add that we propose in the future as in the past to speak out plainly regarding any trade abuses or business topics that may come up for discussion. As we have no political axes to grind, we can afford to be independent, and treat subjects entirely upon their own merits whatever they may be.

As heretofore, we shall be glad to secure communications from our readers, and our columns will always be open for the free discussion of subjects that will tend to advance sound principles, and elevate the standard of commercial morality.

THE INDUSTRIAL EXHIBITION.

The fourth Industrial Exhibition which commences in this city on the 5th of this month and lasts until the 19th, promises to be the greatest thing of the kind ever held in Canada.

The entries especially in manufactures are in excess of any previous Exhibition, while the rapid strides we are making in manufactures make it certain that their quality will be far in advance of the average exhibits of former years.

In the way of attractions, besides the many that the city has always to offer, the directors of the Industrial Exhibition have made most elaborate preparations for the entertainment of the myriads of visitors that are expected at the time. In addition to athletic games, and military reviews, they have arranged to have a mock bombardment and torpedo explosion in the lake immediately fronting the Exhibition grounds.

They also propose to light up the grounds and buildings with the electric light, a novelty and a boon that should be appreciated by many who would otherwise find it impossible to visit the collection of exhibits that Canadian enterprise and rivalry have gathered together.

The Exhibition in itself will be a grand one and well worthy of a lengthened visit, but with the additional attractions provided by the directors it will become of more than ordinary interest. Excursions have been arranged on all the railroad and steamboat lines coming into the city, and the very low fares thus obtainable will make this an unusually favourable opportunity for the people of other parts of Canada to see the "Queen City of the West" at its best.

The low fares thus obtainable will also make the Exhibition time a good one for merchants to visit Toronto, and by a personal inspection, select the goods needed for their fall trade. We trust that as many merchants as can make it convenient to do so, will avail themselves of this opportunity, and we can assure them that they will find the wholesale men of this city ready to give them a warm reception and extend to them every courtesy that lies in their power.

THE SUPPLY OF IVORY.

Every merchant who has dealt in Ivory goods of any kind for years past, knows that every year the price gets higher and higher, and it is now a question how long will it be before Ivory gets so dear as to get beyond the purchasing reach of the many millions of toilers who now use it as a matter of common convenience. In the article of table cutlery alone the annual consumption is something enormous, and although Ivory-handled cutlery is to-day common, we are strongly of the opinion that in less than half a century from the present time it will be ranked as a curiosity. That some good substitute will be produced by scientific men we have no doubt, but so far, all their efforts have fallen short of the requisite qualifications for a good substitute for elephants' tusks.

If any inventor could discover an inexpensive process of making hard white rubber, he would have a material that would fill the bill as far as cutlery and similar articles are concerned.

The best cutlery handle in the market to-day for practical usefulness, is by all odds the patent hard rubber handle. It is hard, takes a fine polish, does not crack and will stand any amount of rough usage. Its only objection is its color, few people like to have black handled table cutlery, but apart from that objection it is the best material for handles yet placed upon the market. If the objectionable color could only be removed and white rubber produced as cheaply and as perfect as the black now is, it would push all other imitations out of the market and damage even the sale of the genuine ivory itself. Whether this can be accomplished or not, we cannot say, but the day is not far distant when this or some other equally good substitute must be found to take the place of the gradually decreasing supply of ivory.

In this connection the *Ironmonger* in the course of a very interesting article upon this subject says:—

"The small supply of ivory, and the consequent augmented prices realised, at the recent sale of that material in London and Liverpool will, doubtless, have a tendency to cause those who are searching for substitutes for it to increase their exertions. Good judges have long been of opinion that the world's supply of elephants' tusks is growing smaller each succeeding year, and now that the "civilisation" of Africa is being so energetically conducted by European travellers there can be little doubt that good ivory will soon be spoken of in the past tense. Those who have perused the records of the travels of Stanley, Selous, Thompson, and other modern travellers in Africa will have noted the relative scarcity of elephants over wide tracts of country in which they were quite numerous not many years ago. This is especially the case in the Eastern parts of South Africa, where the extension of colonisation and the persistency of exploration have driven away such of the herds of elephants as have escaped the rifles of the hunters. There is, therefore, no need for wonder that prices should rise or that fine ivory should command prices not very remote from 1,000*l.* a ton. It is, further, quite certain that as time goes on the supply will gradually grow smaller, particularly as the demand is concurrently becoming greater. The level will be reached sooner or later, therefore when ivory will become a real luxury for cutlery purposes, and not, as now, an article procurable at a moderate price. When that limit shall be reached it is evident that such cutlery will only be purchased by the wealthy; hence our manufacturers will be compelled to devote themselves to the production of substitutes to replace ivory for hafting uses. Action in that direction has been taken, we are aware, by some manufacturers especially in the United States. In that country xylonite and two or three other kinds of hafts are favourably spoken of, whilst in this country Joseph Rodgers & Sons, and possibly one or two firms besides, have for several years sold table-knives with special handles which deserve to be highly commended. These are at present exceptions: They will ultimately become the rule, albeit the day when ivory shall be wholly superseded, even in ordinary cutlery, may be far distant That epoch will, and must, come, however; consequently it is but common prudence to recognise its inevitable advent, and to take precautions accordingly. It is rarely safe to prophesy "unless you know," but this appears to be a matter in respect of which it may be safely foretold that the man who provides a cheap and really effective substitute for ivory will not only earn the gratitude of the trade and of the public, but will indubitably fill his own pockets."

Selected Matter.

A ROYAL TESTIMONIAL.

The Emperor of China recently presented the Chinese merchants of San Francisco with a very fine scroll, as a testimonial of his appreciation of the contributions sent by them to the victims of the Chinese famine three years ago. This scroll, which is four feet high and twelve feet long, is described as follows: "The surface is entirely cross-grained and indented with miniature squares formed by lines running from opposite corners. These squares, uniformly covered with old gold, stand out in bold relief by means of a darker shade of gilt with which the lines are traced. Four large Chinese letters in ebony are carved at regular intervals across the face of the scroll, around which is a rich border of flowers and fruits. The scroll itself is enclosed by a deep, wide frame, upon which is carved a large number of allegorical figures, so wrought and blended together as to appear to have been made of one solid piece of wood. At the lower corners are placed two figures of Chinese gentleman, each holding a sword, the upper corners being devoted to two maidens, each having a tambourine, and depending from which is a long veil, completely encircling their body. The space intervening between the figures is blocked with dark glass, so that under an artificial light the effect is very beautiful." The imperial present has caused a commotion among the Chinese, and great interest and curiosity is manifested by the public in general.—*Ex.*

BURNISHING.

By burnishing the roughness of an object is flattened down until the surface is smooth and polished like a looking glass. Burnishing is an important operation for electro-deposits, which consists of a multitude of small crystals, with intervals between them, and with facets reflecting the light in every direction. The deposited metal is hardened, and forced into the pores of the underlying metal, and the durability is thus increased to such an extent that, with the same amount of silver, a burnished article will last twice as long as one which has not been so treated. The instruments employed for burnishing are made of different materials, and must be of great hardness and a perfect polish. Such are hardened cast steel, agate, flint and blood stone. For metallic electro-deposits steel and blood stones are especially employed. There are several qualities of blood stone; its grain should be close, hard, and without seams or veins; it should leave no white lines on the burnished parts, nor take off any metal, and its color should be of an intense black red. The steel must be fine and close grained, and perfectly polished. Should the polish of

any burnishing tool alter by use, it is restored by friction upon a skin or leather attached to a wooden block, which is fixed to the bench. The leather is covered with polishing ronge in impalpable powder, or, preferably, with pure alumina, obtained by calcining ammonia alum in a forge fire. Venetian tripoli, rottenstone, tin putty, emery, or many other hard substances finely powdered may be employed. The burnishing tools are of various shapes, such as a lance, a tooth, a knife, a half sphere, or a dog's tongue, and a considerable stock is necessary. The burnishing is divided into two distinct operations. The first consists in ronghing, and the second in finishing. The tools for the first have a sharp edge, while for the second operation they have a rounded surface. The tools for the hand or the lathe are fixed by copper ferrules into short round wooden handles, so that the hand is not influenced by their weight. The tools for the arm or vice are fastened to wooden handles, sufficiently long to rest their slender part upon the arm or shoulder. The stouter lower portion is grasped by the hand. The burnishing tools and the objects must be frequently wetted by certain solntions, some of which facilitate the sliding of the instrument, or with others which have a chemical action upon the shade of the burnished articles. Of the first are pure water, solutions of soap, decoctions of linseed and infusions of the roots of marsh mallow or licorice. The second includes wine-lees, cream of tartar, vinegar, alum in water. When burnishing gold applied upon electro-deposits of copper, as is gilding with a dead luster by that method, use pure water, for fear of producing a disagreeable red shade. A solution of green soap is sometimes preferred by operators, although when old, it imparts an unpleasant tinge, owing to the sulphides of the liquor. When the burnishing is completed, the surface is wiped longitudinally with a soft and old calico rag. The polish obtained by burnishing is called black when it reflects the rays like a mirror, and should the presence of mercury or a bad deposit prevent the tool from producing a bright surface, the object is said to be greasy. Articles which have been previously polished, and which generally receive a very trifling deposit, are not burnished, but rubbed with chamois leather and the best polishing ronge. Too thick or too rapid electro deposits cannot be burnished, but must be polished by rubbing with a leather and a mixture of oil and powered pumice stone, tripoli, or tin putty. Coarse powders are used at the begining, and impalpable ones at the end of the operation. Polished silver deposits are more agreeable to the eye than burnished ones, but the hardening of the latter renders them more durable.—*Scientific American.*

REMARKS ON THE WATCH.

Of all the different escapements, a well constructed anchor is undoubtedly the best for all practical purposes. A pocket chronometer is not as reliable, while, if of larger dimensions, and provided with all the possible mechanical appliances, adjuncts, and improvements, a marine chronometer doubtlessly is the best timepiece constructed. When we say "for practical purposes," we do not by any means wish to have it interpreted that the watch may be treated with impunity to any and every indignity, or be used as a toy for children. Let us examine any other piece of machinery ; how strong and powerful it is in any and all its parts : still, it is never required to perform one-half the work of the tiny watch, which unremittingly labors day and night, week day and Sunday, month and year, without intermission or stop, and if it has been duly cared for and tenderly treated, it may arrive at the good old age of one hundred years, while the ponderous machinery is cleaned and oiled every day, with hosts of men to attend to its wants, and lasts only for a span of years.

It will be easily seen that any exterior motions exert an important influence upon the vibration, and consequently upon the arbor and pivots of the balance. If this external motion is in the direction of the vibrating plane of the balance, and a vibration occurs simultaneously in the same direction, the vibration arc is increased ; if in the opposite direction, such an arc will be decreased, and it is only without damage if it occurs vertical to the balance axis.

The most ordinary external motions, however, occur in another direction than that of the balance, whereby a sensible pressnre is exerted upon the axis of the vibrating mass, productive of an increased friction of the pivots upon their bearings, etc., and a retarding, never an acceleration, takes place. For instance, the balance of a watch of a better construction vibrates 18,000 per hour, consequently 432,000 vibrations in twenty-four hours.* Let us suppose such a watch were quietly laid down or hung up for about ten hours—whereby it would go correctly ; but in the next succeeding fourteen hours, it would be worn, the general length of time, and if each vibration of the balance were retarded only by 0.0001, it would be equal to fourteen hours to 25.2 vibrations, or 5.01 seconds ; by a regular use, therefore, in one week, 35.28 seconds, and in one month, 2.52, or nearly three minutes.

By most watches, where the pivot holes are of ruby, the retard of a watch is far larger, and stands pretty well in ratio with the construction and finish of the movement.

A marine chronometer, regulated to an almost imperceptible difference, and having proved excellent upon a long sea voyage, would, when worn as a watch, in consequence of the external motion experienced, go too slow, and far more so than a good anchor watch. Beside all imaginable advantageous improvements, these chronometers are fitted into a separate box, in the so called compass suspension, and suspended in such a manner that they do or should remain in an equal position in all the different motions of a ship.

From the preceding remarks it is very clear that a careful treatment of any, especially a fine-graded watch, is of great moment, and only with such care it will go apparently correct. The winding should be performed slowly, and strong external motion be prevented, and always be done in the morning ; it thus will work well during the day, with the best traction power of its spring, whereby the external motions to which it is exposed during daytime, are pretty well counterbalanced, and immensely better than when wound at night, because it has only the weakened spring to offer as resistance next day. The breaking of the spring, also, need not be feared, as it is no longer at full tension during the night,

*Vibrations-18,000 per hour ; 432,000 per day 12,960,000 in 30 days (one month); 157,680,000 in 365 days. A seconds pendulum makes 3,600 oscillations in one hour ; 86,400 a day ; 2,592,000 in 30 days (1 month); 31,536,000 in 365 days—one year: A marine chronometer, which marks ½ seconds, makes 14,400 in an hour, 345,600 per day ; 10,368,000 in 30 days ; 126,144,000 in 365 days.

and can stand better the ensuing cold. The morning hour is also better fitted for such winding, because dressing takes place at nearly the same hour, more so than going to bed at night.

Keys of soft metal should be shunned; also those which fit badly, because ruining the winding square, and leaving metallic dust in the movement. If the watch is laid either at an inclination, or flat, or suspended at night, it should always be done in the same manner—not differing every night. The rate difference between vertical and horizontal is often significant; by second rate watches sometimes two or three minutes in one night; if it is suspended from a nail, in such a manner that it will rock to and fro with the vibration, an accident which occurs often, and a watch provided with a heavy balance will gain, and, *vice versa*, one with a light one will lose. Of conrse this is in the nature of things. Similar observation have been made by clocks which were not firm within their case.

The temperature difference between the heat of the pocket and a wall nearly to the freezing pomt, is about 20° or 25° Celsius, and a watch shonld, therefore, never either be suspended or laid npon it; the sudden change of temperature may produce the sudden breaking of the spring also the oil thickness, especially if no longer pure, which as aforesaid, produces irregularities of rate; if the balance of the watch is not compensated, it must gain from the above-mentioned carelessness, and if it possesses constructive defects, it may stand still from the cold.†

It is necessary to clean the watch pocket frequently, to free it from all accumulating dust and fibres. Even by the cleanest pursuits, a sort of fiber dust will gather in the pocket, caused by the friction of the watch case, and this is very easily transported to the interior of the movement, and is much more pernicious than common dust, by wrapping around the little component parts, and retards—sometimes prevents their motion, similar to the cobweb with flies.

† The author leaves his watch always in the vest pocket, and hangs this on a peg; the watch is thereby prevented from rocking, and escapes other misfortunes, especially when traveling and lodging at strange hotels, where one is called late at times, and something is generally forgotten in the hurry; it is also possible that the watch, instead of being placed in the watch shoe, may be immersed in the holy water vessel, as happened a friend of ours in a Catholic country.

No other article should be carried in the watch pocket, such as keys, coin, etc.; it is often done, yet highly detrimental and careless. Watch crystals may be broken, and the dials and hands be injured; if the case is not strong, parts of the train are liable to injury, but in the most favorable condition, the case itself may be injured. The watch should never be worn against the bony part of the body.

The dust cover shonld never be opened without necessity; dust and fiber is always located aronnd the rim, also the air is continuonsly charged with dust particles. The canons of the key equally may introduce dust, tobacco and other impurities into the movement, and it should be cleaned frequently. But by even the greatest of care, it is impossible that the watch can go forever without occasional repairs, and it should be cleaned at least once every year. All manner of machinery requires an occasional supervision, and it should be performed at least once a year on a watch, the oil has dried np by this time and become mixed with particles of metallic dust, which act like emery. The author, dnring a long practice, has had occasion to manipnlate costly watches, and several of them were almost ruined beyond repair by having run beyond the time. They generally belonged to people who were afraid to trnst their timepieces to bad workmen, and rather risked the consequences. In such a case, it would be better to lock the watch away.

We have endeavoured to give a few of the details of how a watch should be treated. Entire chapters could be written without exhausting the subject, but let the above suffice for the layman.—*Jewelers' Circular.*

HOW AGATES ARE CUT.

The variety of quartz known as Agate is a variegated chalcedony, with the color distributed in clouds, spots, or concentric layers. The variety called Moss Agate occurs in veins, while the banded agate is found in the form of geodes or balls, and occasionally there will be found in the side of these balls a sort of funnel through which was introduced the silicious matter forming the layers.

Judging from the number of these agates to be seen one might be led into the error of snpposing that they could be found almost anywhere along our shores, and as the prices at which they are sold are very low, it is evident that the cutting and polishing must be done in some country where labor is cheaper than here. However, the explanation is given when we are told that they are German Agates, for although for a number of years comparatively few agates suitable for cutting have been found on German soil, yet we may safely say that, at the present time, nine-tenths of all the commercial agates now in Sonth America, where, especially in Brazil, they occur in great numbers. They are shipped thence as ballast in vessels bound for Hamburg, and from this port and forwarded by rail to Oberstein, where they are sorted into lots, usually in the yard of some well-known inn, and sold at auction. When purchased, they are sent to the agate mills, where they are cut and polished on wheels turned by water power, though of late years steam has been introduced in a few mills.

Along the Idar River, between the towns of Idar and Oberstein, there were, in 1867, one hundred and fifty-three mills, working seven hundred and twenty-four stones. Each mill contains from three to five stones, set on a horizontal axle, one end running outside the workshop and communicating with the water-wheel. The mill-stones are usually red sandstone, about five feet in diameter, and rotate in a vertical plane, the broad edge of the wheel being kept moist by a stream of water trickling down upon it from above. The choice agates are usually cut into shape with steel wheels and diamond powder. The common ones, however, are not sawn, but roughly dressed with hammer and chisel, the workmen acquiring, by long experience, great dexterity in applying their blows so as to obtain the desired fracture.

The grinding is done on the broad edge of the wheel, which is furrowed with channels corresponding in shape with the form which it is desired to give the object in hand. The agate is usually attached to a small stick, and thus applied to the moving wheel.

Each stone accommodates two men, but these men, instead of sitting at the wheel, are stretched in an an almost horizontal position upon a wooden stool made to fit the body. The limbs are thus left free, the hands holding the agate to the wheel, while the feet are strongly pressed against blocks of wood fastened to the floor. After being ground, the agates are polished on cylinders of hard

wood, or on lead or zinc discs, fed with a mixture of Tripoli and water.

Many of the agates, beautiful as they are in nature, are artificially colored in the following manner: Having been well washed, they are placed in a sirup of honey and water, sometimes in olive oil; after this, they are exposed for some time to moderate heat in a vessel embedded in hot ashes, care being taken that the liquid does not boil. When removed, they are washed, placed in sulphuric acid, and exposed to gentle heat. After they have taken color they are again washed, and it is often the practice finally to lay them in a bath of oil, which improves the lustre. Some layers of agate are quite porous, while others are dense and well nigh impervious. When steeped in oil only the porous layers absorb the liquid, which, being deoxidized and blackened by the acid, makes the contrast between the layers more striking, thus enhancing greatly the beauty and value of the agate. Other colors are given agates by various processes; some, such as the reds, by simple exposure to heat; others by immersion in certain solutions; but these methods vary with the different lapidaries, and are more or less trade secrets.—H. L. Preston, *in Jewelers' Journal.*

GOLD.

Gold is the most malleable, ductile, and most brilliant of all the metallic substances; and, next to platina, the heaviest and most indestructible.

Gold is seldom found except in the metallic state. It has been obtained in every quarter, and almost every country of the globe; but North and South America supply a greater quantity than all the rest of the world.

Many laborious experiments have been repeatedly made by able chemists, who appear to have established the fact, that gold exists in vegetables.

A single grain of gold can be made to cover an area of more than 400 square inches; a wire of one-tenth of an inch in diameter will support a weight of 500 pounds; and Dr. Black has calculated that it would take fourteen millions of films of gold, such as cover some fine gilt wire, to make up the thickness of an inch, whereas the same number of leaves of common writing paper would make up nearly three quarters of a mile.

Though opacity is enumerated as one of the characters of the metals, yet gold, when the $\frac{1}{282000}$th of an inch thick, which is about the thickness of ordinary gold leaf, transmits light of a lively bluish green color. Perhaps all the other metals, if they could be equally extended, would show some degree of transparency, but none of them can be made so thin.

The specific gravity of unhammered gold is 19.258, and is increased but little by hammering. Its hardness is 6. It melts at 32° of Wedgwood; and, if pure, its color when in fusion is not yellow, but a beautiful bluish green, like the light which it transmits.

Gold cannot be volatilized, except at an extreme heat. The utmost power of Parker's celebrated burning lens exerted upon it for some hours, did not cause it to lose any weight which could be discovered; but Lavoisier found that a piece of silver, held over gold melted by a fire maintained with oxygen gas, was sensibly gilt; and perhaps the same delicate test would have shown its volatility by the lens.

After fusion, gold will assume the crystalline form. Tillet and Mongez obtained it in short quadrangular pyramidal crystals.

Gold unites with most of the metals. Silver renders it pale; when the proportion of silver is about one-fifth part, the alloy has a greenish hue. Silver separates from gold as from platina, if the alloy be kept for some time in fusion.

Gold is strongly disposed to unite with mercury; this alloy forms an amalgam, the softness of which is in proportion to the quantity of mercury. It is by mercury, that in South America, gold is chiefly obtained from the earth with which it is mixed, and the gold is separated by distillation. This alloy readily crystallizes after fusion. It is applied by gilders to the surface of clean copper, and the mercury is driven off by heat.

Gold unites freely with tin and lead, but both these metals impair its ductility. Of lead, one quarter of a grain to the ounce renders the gold brittle; but tin has not so remarkable an effect.

Copper increases the fusibility of gold, as well as its hardness, and deepens its color. It forms the usual addition to gold for coin, plate, etc. The standard for gold in America, Great Britain and her Provinces is twenty-two parts pure gold and two parts copper; it is, therefore, called "gold of twenty-two carats fine."

Iron forms an alloy with gold, so hard as to be fit for edge tools. Its color is grey, and it obeys the magnet.

Arsenic, bismuth, nickel, manganeze, zinc and antimony, render gold white and brittle. When the alloy is with zinc in equal proportions, it has a fine grain, takes a high polish, and from these qualities, and its being not liable to tarnish, it forms a composition not unsuitable for the mirrors of telescopes.

For the purpose of coin, Hatchett considers an alloy consisting of equal parts of silver and copper as the best, and copper alone as preferable to silver. The same distinguished chemist gives the following order of different metals, arranged as they diminish the ductility of gold, viz., bismuth, lead, antimony, arsenic, zinc, cobalt, manganese, nickel, tin, iron, platina, copper, silver. The first three were nearly equal in effect, but the platina was not quite pure.

The nitric acid will take up a very minute quantity of gold, but the nitromuriatic and oxy-muriatic acids are its only real solvents. The two latter acids are of a similar nature, and their effects on gold are increased by concentrating them, by enlarging the surface of the gold and by the application of heat. The solution is of a yellow color, caustic, and tinges the skin of a deep purple. By evaporation it affords yellow crystals, which take the form of truncated octahedrons. These crystals are a muriate of gold; they may be dissolved in water, and will stain the skin in the same manner as the acid.

Most metallic substances precipitate gold from its solution in the nitromuriatic acid; lead, iron and silver, precipitate it of a deep and dull purple color; copper and iron throw it down in its metallic state; bismuth, zinc, and mercury likewise precipitate it. When precipitated by tin, it forms the *purple precipitate of Cassius*, which is much used by enamellers and manufacturers of porcelain.

Ether, naphtha, and essential oils, take gold from its solvent, and from liquors which have been called potable gold, and are used in gilding. The gold obtained from these fluids by evaporation is extremely pure.

If diluted nitromuriatic solution of gold be used to write with upon any substance, and the letters while yet moist,

JOHN SEGSWORTH & CO.,

23 Scott Street, Toronto, Ont.

Our Stock is now complete, and embraces the following Goods, of which we have one of the Largest Stocks in the country. All bought for Cash.

COLORED GOLD, 15 KARAT JEWELRY: —Sets, Earrings, Brooches, Scarf Pins, Lockets, etc., etc.

" " 10 " " —Sets, Lockets, etc.

BRIGHT " 10 " " —Brooches, Earrings, Lockets, Scarf Pins, etc.

SILVER JEWELRY:—Sets, Earrings, Brooches, Bracelets, Bangles, Necklaces, Lockets, Scarf Pins, Gents' Suites, etc.

LADIES' GEM RINGS—A Splendid Assortment. **ENGLISH GOLD CHAINS.**

Also, we keep on hand the Largest Stock of American Waltham Watches in the Dominion, and have in Stock now the Prettiest Designs in Waltham made Gold Cases.

Our Stock of American Jewelry is also very complete in Sets, Brooches, Lacepins, Earrings, Rolled Plate Alberts, Guards and Necklaces of the Newest Patterns and Best Quality.

In addition to the above, we make a Specialty of finely finished Gold Chains of American Manufacture, of all the latest styles, unsurpassed by any stock in the country.

To prove that the above is correct, we would ask our customers and the trade generally to inspect our stock; if not in the City during the Exhibition IT WILL PAY YOU to wait till our Travellers call on you, which will be at an early date.

Yours truly,

JOHN SEGSWORTH & CO.

be afterwards exposed to a stream of hydrogen gas, the gold will be revived and the substance will appear gilt. Ribbons may be gilt in this manner. Sulphurous acid gas revives the gold in the same manner.

Lime and magnesia precipitate gold from its solution in the form of a yellowish powder. Alkalies do the same, but an excess of alkali re-dissolves the precipitate. The precipitate obtained by means of a fixed alkali appears to be a true oxide; it is taken up by the sulphuric, nitric and muriatic acids, but separates by standing with crystallizing. The precipitate by gallic acid is of a reddish color, and very soluble in the nitric acid, to which it communicates a blue color.

Gold precipitated from its yellow solution by ammoniac, forms a powder called *fulminating gold;* this dangerous compound detonates by friction, or a very gentle heat. It cannot be prepared or preserved without great risk. Macquer gives an instance of a person who lost both eyes by the bursting of a bottle containing some of it; and which exploded by the friction of the glass stopper against an unobserved grain of it in the neck of the bottle.

Green sulphate of iron precipitates gold of a brown color; but this soon changes to the color of gold.

The alkaline sulphurets precipitate gold from its solution; the alkali unites with the acid, and the gold falls down combined with the sulphur. The sulphur may be expelled by heat.

The alkaline sulphurets will also dissolve gold. Thus, if equal parts of sulphur and potass, with one-eighth of their joint weight of gold in leaves, be fused together, the mixture, when poured out and pulverized, will dissolve in hot water, to which it gives a yellowish green hue. Stahl wrote a dissertation to prove that Moses dissolved the golden calf in this manner.

Sulphur alone has no effect on gold. The process called dry-parting is founded upon this circumstance. This is used for separating a small quantity of gold from a large quantity of silver. The alloy is fused, and flowers of sulphur are thrown upon its surface; the sulphur reduces the greater part of the silver to a black scoria. The small remainder of the silver may now be separated by solution in nitric acid. The advantage of the operation consists in saving the large quantity of nitric acid which would have been required to dissolve the silver of the alloy in its original state.

The heat produced by the electro-galvanic discharge reduces gold to a state of a purple oxide.—*Jewelers Journal.*

WATCH OIL—CARE TO BE USED IN ITS APPLICATION.

Among the substances used by the watchmaker, oil is one occupying a first rank, being of the greatest importance. No matter how carefully has been the construction of a time-piece, its functions are subordinate to the continuous presence of a fatty body introduced into all the parts where friction occurs; without this precaution, the organs in contact would very soon be subject to early wear and destruction, thus producing the stoppage of the mechanism; the same would equally result if the oil employed were to loose its fluidity, and by its solidification seriously interfere with the rate. It is true that there exists no lubricating agent which indefinitely preserves its primitive conditions; all change with the lapse of time. The duration of the correct rate of a clock or watch is consequently limited by the time until the lubricator degenerates; clocks which possess a large motor and small resistance preserve their oil longer. Cases are not wanting in which they kept correct rate for ten or fifteen years, but as for watches, whose motive power is small, the least thickening of the oil in the last moveable parts, occasions a resistance which soon is impossible to overcome, and the watch stops. The timepiece must be taken asunder, cleaned and fresh oil applied. Its duration does not last beyond one and one-half or two years at most, and these little mechanisms are only in good order when in conditions of having been cleaned at short intervals, so imperfect is the agent used by the watchmaker for lubricating.

It will be seen that a judicious choice of oil must be all-important to him. Watchmakers and chemists have occupied themselves with the question, and more than once the results have, at least in theory, led to the anticipations that the grand desideratum was discovered at last, but practical experience very soon destroyed all hopes—no oil prepared by any new processes has as yet resulted in anything permanent.

Choice of Oil.—We will quote M. H. Robert by saying that the best watch oil is made of olives. Some prefer animal oils, notwithstanding its greater viscidity; they find it to withstand the influences of the sea better than that from olives. Experiments have been tried with neats', mutton, even ducks' foot oil, and all, with due care, have given good results.

Animal oils are submitted to a pretty high temperature, for extracting, while those from olives should not be heated beyond 50°.

There exists no other means, actually, than a sufficiently long experience for distinguishing good or bad oils. The watchmaker, consequently, is reduced to confidence when purchasing it. The good faith and renown of the manufacturer are his only guarantees. These remarks are specially applicable to olive oil.

It is believed that certain indications will betray the quality, from the manner in which it behaves when brought into contact with brass for several days. It would not be prudent to put too much faith in the presumptions, as they may occasion mistakes.

A good watch oil should have the following qualifications: 1. It must preserve its primitive fluidity for a long time; 2. It must not attack the brass with which it is brought into contact; 3. Possess a good fluidity; 4. It must not thicken on exposure to cold; 5. It be absolutely free from all glutinous or resinous substances.

Of all these qualifications, the preservation of its fluidity is the most important; of course, no oil preserves it forever, all thicken and solidify with time, and it may be expected that a retardation of rate will commence with the change. Oils prepared by the watchmaker himself may last for three years, and clocks may still continue to preserve a good rate for longer time. Astronomical clocks will go as long as twelve years before requiring a cleaning, but chronometers should never be let go more than three years; watches require to be cleaned every eighteen months at longest.

Brass oxidizes more or less in contact with oil this will even eat into it, and it assumes a clear green, and at times a black color. If these symptoms appear in a pronounced manner, at the end of a short time, the oil had better be thrown one side as unfit.

A fluidity more or less great is of no importance, but it is utterly indispensable

SIMPSON, HALL, MILLER & CO.

that the oil should preserve it without thickening. If attention were bestowed simply to the inconvenience occasioned by the resistance on the pivots, the most fluid would only be used, especially for the latter moveable parts, whose velocity is greater and power less; but we have on this side the fact that too fluid an oil does not keep. Thus, if one too fluid in consistency were used on cylinders, the parts would very soon run dry, but the same kind of oil would answer very well for the smaller pivots, by reason of their greater adaptability to the sinks. The consistency of the oil should therefore be in proportion to the pressure, and a thicker oil will be found better adapted for the first moveable parts. It is rare however, that the watchmaker uses all the care requisite, chronometers excepted; the same kind of oil is used at all train parts.

Animal oils, being generally thicker, are better adapted for large clocks; they could be well used for lubricating the blade and pivots of the mainspring. Some chronometers makers prefer them to that from olives, and think it is better preserved at sea.

Freezing.—Olive oil shows a very variable manner under the action of cold, even when appearing to be identical in their nature. It is not good to judge of the quality by the temperature in which it congeals. This change of state occurs from 4° to 20.°

Congealed oils neither have the same appearance nor the same state. Thickened oils are more viscid than fresh ones under the action of cold, and offer greater perturbations in the rate than the latter. In general, an oil curdling with an average degree of cold is not objectionable for the first wheels; it suffices it hould preserve its fluidity with—4°. The rate of the timepiece is not affected thereby. A contact with metal will keep oil fluid; and it may still be so at the pivots while that in the bottle from which it has been taken has already become congealed.

Many causes contribute to degenerate oil. Thus,

1. The nature of the oil itself. Every oil deteriorates after a while of itself, independent of foreign influences.

2. A contact with the air. The elements in the air combine little by little with it, and modify its nature.

3. An action of light. This influence singularly favors a degeneration.

4. Humidity.

5. A rise of temperature, or an intense cold; in fact, every sudden variation of temperature.

6. Emanations arising either from persons or localities; chronometers frequently deteriorate at sea, and on some vessels more than on others. Some persons are obliged to have their watches cleaned oftener than others.

8. Clocks enclosed in not thoroughly seasoned oak timber; the tanic acid given off slowly decomposes the oil.

8. The nature or composition of the metal or alloy employed.

9. The state of the lubricating surfaces.

10. The kind of friction. A pivot badly rounded or polished, or working in too large a hole, is liable to wear; also a high pressure, etc.

The different kinds of brass do not behave alike with oil; certain ones alter more or less, and are more or less affected by others; simple cast brass is very inferior to the drawn or hammered article. The same kind of brass even acts differently, in accordance with having been hammered more or less in a cold state.

The gilding of watch trains by means of mercury serves the double purpose of stopping the oxidation and keeping the oil from spreading; it is caused by the graining left by the gold amalgam on the parts.

Gold, of all metals, preserves oil best; next to gold, gilt brass. Brass of good quality, well hammered, alse gives good results. When simply cast, it alters the oil very rapidly. All other metals tried up to date, copper included, are inferior to brass, as far as regards their oil preserving qualities.

PRESERVATION OF OIL IN THE RUBBING PARTS.

It now remains to examine how oil behaves on subjects, and what precautions must be taken to prevent its spreading. This action, altogether mechanical, is regulated by natural laws, and may be determined beforehand; but these questions appear to have little engaged the attention of artisans, and we are forced to collate them from works of different authors, who have barely spoken of them.

The interior cylinder walls retain the oil well. This fact favored by the form of the club teeth of the scapewheel, has eminently contributed to the success of the cylinder escapement, and explains in a great measure the universal regard in which it is held. A number of escapements, obsolete to-day, do not deserve their fate, but for the difficulty with which they retain oil. A lack of this is followed by the wearing of the rubbing parts; destruction progresses, and the timepiece soon becomes unfit for use, giving rise to frequent repairs. Thus, a service of only short duration is obtained, which of itself is a capital offense of the mechanism subject to many other accidents. The cylinder escapement, if executed on sound principles, will go a long time without wear.

If the scapewheel teeth are pointed, the oil is kept from spreading by filing on the face of each tooth a little groove; it is well to extend it to the other side, it may be cleaned with greater dispatch. The oil tending to run to the wheel's center, is forced to stop at or near the point. Th. Reid, an English horologer, practised this disposition with success. Others have found it practicable to file a little cleft at the end of each tooth, to serve as sink. Mr. Robert, in his carefully constructed timepieces, pierces each tooth of the scapewheel for the same purpose.

Others make these teeth of concave form; the oil being driven from the two sides finds a place to lodge.

Cavities introduced for the purpose of storing oil at the pivot holes, to lubricate the rubbing part, are known by the name of sinks. Their forms must comply with three conditions, viz., Maintain the oil at the same place—without running; inclose the largest possible quantity; prevent an exposure to air of the oil.

A certain amount of oil, put into the sink will remain there without spreading; by increasing the quantity, it will run out and the pivot runs dry. Only use sufficient, for fear of running out.

As a contact with air changes the oil and forms a pellicle over it, this destructive agent must be guarded against by offering the least surface possible.

To apply oil intelligently, plunge a clean steel rod into the bottle, and withdraw it quickly; the oil remaining attached thereto is put into the oil cup; and with a little steel staff or drill apply it to the parts; put it exactly to the bottom of the hole, only in a quantity sufficient to be contained within the sink; taking care not to touch it elsewhere, it might call out the other oil, by offering it a facility to run.

Preservation.—It is not sufficient that the watchmaker be provided with good oil, he must seek to preserve it, as follows:

WE BEG TO CALL THE ATTENTION OF THE TRADE to the well known quality and elegance of finish of our Gold Cases, guaranteed by us to be of eighteen karat Gold, U. S. Mint assay, or of fourteen karat Gold, as may be stamped, and also to our mode of selling the same, charging only for the ACTUAL WEIGHT *of the gold used, and not for the base metal comprised in springs, key pipes, filling of crown, etc. To illustrate which we here show copy of tag accompanying each one of our Gold Cases, which plainly indicates not only the gross weight of the Case, but also the* NET *weight of the gold.*

AMERICAN WATCH COMPANY,

ROBBINS & APPLETON,

New York, August 1st, 1881. General Agents.

IN EXPLANATION OF THE ABOVE we desire to say that the old plan of charging for the gross weight of the case, as if it were all gold, worked well enough as long as the manufacturers were content with the amount of brass and steel actually required in its construction; but when the business was degraded into a contest as to who should get the most base metal into the least quantity of gold and call it a GOLD case, then the time came when, in the interest of dealers in American Watches, it became necessary to adopt a plan of selling, showing the buyer exactly how much GOLD each Case contained.

In adopting this method we act in conformity with the earnest wishes of the leading houses of the Trade, some of whom have already undertaken to carry out the same idea in their own business.

ROBBINS & APPLETON,

GENERAL AGENTS.

1. By keeping it in shelter, from contact with the air; the bottle must constantly be kept vertical, and it should be long, narrow, and carefully corked. Never tip the bottle to one side, to pour out; let none run on the sides. Let the cork be of the best quality.

2. Keep it in a perfectly dark place, and do not expose the bottle to the light any longer than necessary to take oil therefrom, in the manner prescribed.

3. Keep it under cover in a dry and sweet place; removed as much as possible from all agitations of the air and exposures to sedden changes of temperature.

We have endeavored to elucidate the question, and leave it to the practical experiment of the watchmaker to "charge, alter, and amend." Every intelligent horologer will concur in saying that we are not yet by any means in possession of the best lubricating agent possible.—*The Jewelers' Circular.*

BUSINESS CHANGES FOR AUGUST.

Rob. Wilson, Odanah, Hardware, style now Wilson & Harrison; Adam Hope & Co., Hamilton, Wholesale Hardware, Mr Adam Hope of this firm dead; Thexton Bro., Lindsay, Hardware, offering 50c on the dollar; A. D. Cooper, Midland, Jewelry, removed to Waubaushene.

BUSINESS NOTES.

H. Lafontaine, watchmaker of Sorel, is making a watch to indicate the seconds, hour, day of the week and month, and the moon's phases. It will be composed of 500 parts.

Mr. John Segsworth has just returned from his English trip, and looks much the better for the change. He brings with him a large stock of new jewelry, and intends to rush things during the next few months.

We are glad to notice the return from Europe of Mr. R. Y. Ellis, of the firm of P. W. Ellis & Co., Wholesale Jewelers, of this city. Mr. Ellis looks well, and says he had a splended time while away, and is now fit to do any amount of work. From present indications he will have plenty to do before the year is out.

As will be seen by our advertising columns, Mr. A. C. Anderson, Wholesale Jeweler of Hamilton has recently returned from England, where he has been on a business trip. His selections will be found of the latest styles and his customers may depend upon getting good value.

Says the *Monetary Times*, "An Oshawa hardware man, Mr. T. W. Gibbs, has been in trouble for a long time. Several years ago he got an extension of time and carried out the arrangement. Now, we are told that his Montreal creditors have again consented to favor him. He has made earnest efforts to succeed.

Mr. Samuel Stern, who has been absent in Europe for the past three months, is home again, after having personally supervised the shipment of his fall purchases. His stock of clocks and fancy goods will be unusually complete this year, and buyers visiting Toronto should drop in and inspect his goods before placing their orders.

The new telephone recently placed in Messrs. Zimmerman, NcNaught & Lowe's office is the first and only one in any jewelry establishment in the city. The firm find it exceedingly useful in many ways, and fully appreciate the saving in time effected by its use. Buyers visiting the city are invited to avail themselves of its assistance, where possible, in the transaction of their business.

The Toronto Silver Plate Co. are getting rapidly into shape, and expect to have some goods of their own manufacture upon the market in the course of the next few weeks. Under the able superintendance of Mr. J. A. Watts, the machinery is being put in, and the other arrangements pushed rapidly forward. They have already about thirty hands at work and expect to employ about fifty more when in full running order.

Hon. Adam Hope, who died last month of paralysis, was a well known and honored Canadian merchant, of amiable character and marked ability. He was born in East Lothian, Scotland, and at the time of his death was in his 70th year. Having been some six years in the counting-house of a Leith firm, in which Mr. David Davidson, formely General Manager of the Bank of Montreal, was then a partner, Mr. Hope came to Canada in 1834, and entered the office of Young, Weir & C., merchants, Hamilton. Beginning business on his own account in St. Thomas in 1837, he removed to London in 1845, where the firm was Hope, Birrell & Co., the late Mr. John Birrell being the partner, and subsequently to Hamilton in 1865, when the firm became Buchanan, Hope & Co. The deceased gentleman was senior partner in the wholesale hardware firm of Adam Hope & Co., Hamilton, President of the Hamilton Provident and Loan Society, and Director of the Canadian Bank of Commerce. He had been, too, the first president of the Huron & Erie Loan Co., founded about 1864 in London. M. Hope was called to the Senate by Hon. Alex. Mackenzie five years ago.

New Premises.—A Strathroy Exchange says: Mr. W. F. Snell can now be found in his new store two doors west of his old stand. Mr. S. has shown considerable taste in the arrangement of his new premises. In addition to the plate glass front the walls have been nicely papered and bordered, and the ceiling very handsomely frescoed. Tables of cherry with walnut trimmings are used in place of counters, on which rests his show cases; walnut bracket shelves are arranged on the east wall for to show off his stock of clocks and the west wall is to be filled up with glass show cases for silver and plated ware. In the rear is a large storeroom and workshop. When completed Mr. S. can boast of having one of the finest jewelry establishments west of Toronto.

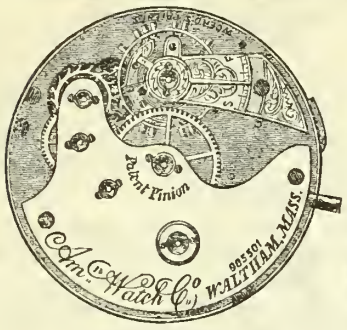
WORKSHOP NOTES.

Scarce Brass Alloys.—Bristol brass (Prince metal), 6 parts copper, 2 zinc; Japanese brass (Sinchu), 10 parts copper, 5 zinc. White brass, 1 part copper, 8 zinc, 1 iron — very suitable for statue casts in place of bronce.

Rust.—Nuts are oftentimes so tightly rusted upon screws that other means must be made use of to loosen them; kerosene or naptha, even turpentine, will in a short time penetrate between nut and stem. Next heat them in fire which quickly severs them.

Bronce.—Bronier claims to have discovered a simple method to make bronce malleable; it consists in the addition of from ½ to 2 per cent. of mercury, and appears to act rather mechanically than chemically. It is added to one of the metals of which the alloy is made.

Varnish for Pasteboard, Wood, Metal, &c.—Marine glue, 2 parts, yellow, gum lac, in scales, 1 part. Dissolve in wood spirits (pyroligneous spirits). This varnish may be applied to paper, pasteboard, wood and metals. If thick it may be used for gluing wood.



Bronzing Medals.—According to the *Revue ind.*, medals are bronced in the Paris mint by boiling them in a copper kettle, not tinned, however, in a solution of 500 grams pulverized verdigris, and 475 g. pulverized sal ammoniac, in 160g. strong vinegar and 2 liters water. The medals are kept apart by wood or glass rods.

Varnishes.—*Gold varnish for brass objects, physical instruments*, etc.: Gum lac, in grains, pulverized, 90 grams; copal, 30 g.; dragon's blood, 1 g.; red sandal wood, 1 g.; pounded glass, 10g.; strong alcohol, 600g.; after sufficient maceration, filter. The pulverized glass simply serves for accelerating the dissolving, by interposing between the particles of gum lac and copal.

Polishing Steel.—If the steel is of moderately good temper, use a zinc polisher with diamantine; a tin polisher is better for soft steel. The diamantine should be mixed on glass, using a beater also of glass, with very little watch oil. Diamantine mixed with oil becomes gummy, and quite unfit in a day or two, and turns black, if brought into contract with metal in mixing.

Cleaning Rags.—The rags, which are excellent for polishing metal surfaces, are prepared in the following manner: Dip flannel rags into solution of 20 parts dextrine and 30 parts oxalic acid in 20 parts logwood decoction, wring them gently, and sift over them a mixture of finely pulverized tripoli and pumice stone. The moist rags are piled above each other, placing a layer of the powder between each two. They are then pressed, taken apart and dried.

Wrapping Paper for Silver.—The *Archiv. d. Pharm.* gives the following for preparing a good wrapping paper: 6 parts caustic soda are dissolved in sufficient water until the hydrometer shows 20° Beaumé; 4 parts oxidized zinc are added to this solution and boiled until dissolved. Sufficient water is then added to dilute the mixture to 10°B. The paper or calico is dipped into it, and dried. All silver articles wrapped in it, are protected against the sulphuretted hydrogen, which, as is known, is contained in the air of all large cities.

SUPERIOR QUALITY. SUPERIOR FINISH.

SOLD BY LEADING JOBBERS.

CEMENT FOR CAOUTCHOUC.—It is recommended to macerate pulverized shellac in ten-fold its weight of a strong aqueous solution of ammonia, so-called spirits of hartshorn, whereby a transparent, gelatinous mass arises, which becomes fluid if the bottle containing the gelatine is immersed in hot water. It also becomes fluid after standing from three to four weeks. When to be applied, both surfaces to be united are moistened with the mass and pressed together. As soon as the ammonia is evaporated, the caoutchouc becomes as hard as the homogenous caoutchouc mass itself. The cement is also suitable for uniting caoutchouc to glass, metal, etc., in fact, upon all smooth surfaces.

SOFT GOLD SOLDER.—Melt equal parts of 14-karat gold and silver solder, and hammer it into a thin sheet upon the anvil. This solder will satisfy all the demands of a watch repairer. It is advisable to use silver solder for low grade, say 6 or 8-karat gold goods, which consists of 2 parts fine silver and 1 brass, with the addition of a gram of tin. Another nice soft solder for 8 and 14-karat gold, consists of 1.5 parts fine silver, 0.5 fine copper, 1.16 14-karat gold and 0.4 zinc: the first three metals are well melted and mixed together, and when well in a fluid state, the zinc is added, the whole left for a few moments in fusion, until it melts, not volatilizes, and then cast.

TO SILVER GLASS.—Dissolve 3 grains of ammoniacal nitrate of silver in 1 oz. distilled water, which solution must be rendered somewhat clouded by sufficient nitrate of silver, and then filted. Immediately before use, mix 1 oz. of this solution with 2½ grains Rochelle salt. The glass to be silvered having been cleaned to its utmost, is placed into a suitable vessel, the bottom of which is provided with a few cones, thus raising the glass about one inch above the bottom, and the fluid is poured over it. The vessel is placed on the northern part of the house, or in a place with deadened light, and the silver precipitated will be sufficiently thick in two hours. It taken out, washed and dried; if the glass with the silver pellicle is to be used as reflector or speculum, the coating must be protected by varnish.

CRYSTALS.—Dr. Bottcher publishes a very simple method of coating paper, wood, or glass with crystals: Mix a very concentrated salt solution, in cold, with dextrine, and apply the fluid with a broad, soft brush upon the surface to be decorated, spreading it in a layer as thin as possible. After drying, the surface will show a very handsome, pearl-lustrous coating, which on account of the dextrine, very tenaciously adheres to the surface. It may be made adhesive to glass by coating it with an alcoholic solution. Salts especially suitable for the purpose are specified Dr. Bottcher to be sulphate of magnesia, acetate of soda, and sulphurate of zinc. If paper is to be decorated in the same manner, it must be sized. Unsized paper absorbs the fluid, and prevents a regular formation upon its surface. Visiting cards of this style, by the name of alabaster cards have for some time been in high favor. Colored glass provided with such a coating, is very handsome if light can penetrate it.

CLEANING IVORY ORNAMETNS.—Ivory ornaments are quickly cleaned by brushing them with a new, not very sharp tooth brush, to which a little soap is given; then rinse the ornament in lukewarm water; next dry the trinket and brush a little, and continue brushing until the luster reappears, which can be increased by pouring a little alcohol upon the brush and applying it to the trinket. Should this have become a little yellow, dry it in gentle heat, and it will appear as if new. Ivory that has become yellow may easily be bleached in the following manner: The article is placed under a glass bell, together with a small quantity of chloride of lime and muriatic acid, whereby chlorine is developed, and exposed to sunlight. Be very cautious not to breathe the vapors, as they are very poisonous. The bleaching power of the chlorine destroys the yellow pigment upon the surface, and the article will be restored to its original luster.

CLEANING SILVER.—A correspondent to *La Nature* sends the following recipe, the practical value of which he has tested for years: Cyanide of potassium, 30 gr.; hyposulphite of soda, 20 gr.; water, 1000 gr.; ammonia, sufficient quantity. The liquid is prepared cold and the silver is immersed cold.

Another subscriber sends the following recipe water, 1 liter; sulphate of amonia, 5 gr.; sal ammonia, 10 gr.; cream of tartar 10 gr.; common salt,: 10 gr.; alum, 15 gr. Dissolve and boil, and plunge the articles therein for a short time.

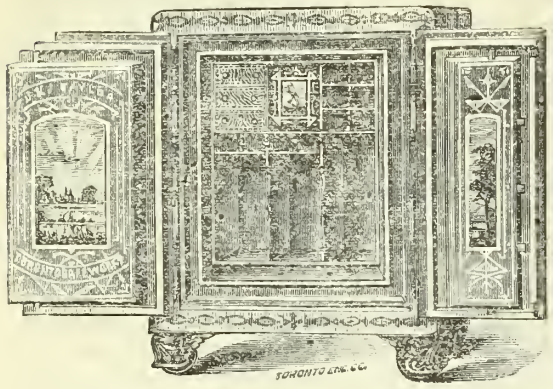
GOLD COLOR UPON BRASS.—To color brass gold color, dip it, after having been polished bright, into a diluted solution of neutral acetate of copper (crystalized verdigris), in which, however, must be contained no free acid.

Mat, greenish-gray upon same.—Paint it several times with a well diluted solution of chloride of copper.

Violet upon same.—Heat brass until you can barely hold it in your hands, and then, with a ball of loose cotton, paint it uniformly with ordinary officinal chloride of antimony, and it will color a handsome violet.

NICKEL-PLATING.—Dr. Kaiser describes a single process of nickel-plating. Preparo a bath of pure grannlated tin tartar and water, and having been heated to the boiling point, add to it a small quantity of puro red hot oxide of nickel. A portion will soon dissolve, and give a green color to the grains of tin. Articles of copper or brass plunged into this bath in a few minutes acquire a bright metallic coating of almost pure nickel. If a little carbonate or tartrate of cobalt added to the bath, a bluish shade, either light or dark, may be given to the coating, which becomes very brilliant, when properly polished with chalk or dry lime dust.

METALLIC objects may be colored by immersing them in a bath formed of 640 grains of lead acetate dissolved in 3,450 grains of water and warmed to from 38° to 90° Fah. This mixture gives a precipitate of lead in black flakes, and when the object is plunged into the bath the precipitate deposits on it. The color given depends on the thickness of the skin, and care should be taken to treat the object gradually, so as to get a uniform tint. Iron treated thus acquires a bluish aspect like steel; zinc, on the other hand, becomes brown. On using an equal quantity of sulphuric acid instead of lead acetate, and warming a little more than in the first case, common bronze may be colored red or green with a very durable skin. Imitations of marble are obtained by covering bronze objects, warmed to 100° Fah., with a solution of lead thickened with gum tragacanth, and afterward submitting them to the action of the above mentioned precipitato of lead.



SCIENCE NOTES.

DETONATING WATCHES.—Watches with alarm are an old contrivance, but one which at the appointed time fires a shot, certainly is a product of the present era, not much known yet, and still less "to Solomon in all his glory." The mechanism producing the effect is that in common use, and regulated at the dial; on the outer case rim is a spring which is cocked at the same time, a little piston protrudes upon which a cap is placed. At the appointed hour, the spring flies off, hits and explodes the cap with a noise sufficient to waken Rip Van Winkle himself.

AMALGAMATING salt for optical and mechanical use, is, according to the *Central Ztg.*, made by dissolving ½ kilo. mercury in a mixture of ½ kilo. nitrac acid and ½ kilo. muriatic acid. The solution is prepared in a porcelain dish in a sand bath, under a well drawing chimney like a blacksmith's furnace. Another good method is to dissolve 8 parts of oxyde of mercury in 100 parts water and 10 parts muriatic acid. Dip the zinc parts into this fluid for a moment, then rinse and brush them, and they will be found coated with a silver like coat. The application can be made with a small brush or sponge. Protect your hands against the poisonous properties of the salts of mercury; it might penetrate through the skin into the body and cause salivation and mercury poisoning.

PEARL fishing on the coast of Lower California is an important industry, no less than 1,000 divers being employed in bringing up the costly black pearl, which is found in a great state of perfection in the deep waters of La Paz. The pearl oysters are found from one to six miles off shore, in water from one to twenty-one fathoms deep. Merchants provide hats, diving apparatus, etc., for the prosecution of the business, on condition that they can purchase all the pearls found at prices to be agreed upon. These boats, which are usually of about five tons burden, sail up and down the coast from May to November, searching for treasures. The product of the year's work is about $500,000, [illegible] the pearls at their first value.

THE Berzelius pencil to cut glass is made in the shape of a pencil, red hot, and applied to the glass, which it cuts in the fire and the point of beginning is to be started with a file; It is composed of the following ingredients: gum arabic, 60 parts; gum tragacanth, 23; benzoin or benjamin, 23; lamp black, 180; water in sufficient quantity. The gum tragacanth is steeped in water for several hours, and the gum arabic is dissolved in a sufficient quantity of water, while the benzoin is pulverized very finely. The three components then are mixed, the lamp black and enough of water added to make a dough of a consistency to be moulded into pencil shape, which are finished by being rolled between two flat surfaces. With skill, a bottle may be cut into a spiral shape which draws out like a spring; the pencil is a very appropriate tool in the workshop of any tradesman.

J. & J. TAYLOR,

TORONTO SAFE WORKS.

Patentees and sole manufacturers of Taylor's patent Fire proof Safes with

Non-Conducting Steel Flange Doors.

ALSO MANUFACTURERS OF

Burglar Proof Safes, Vaults, Vault Doors, Bank Locks, Combination Locks, Prison Locks and all Kinds of Fire & Burglar-Proof Securities.

20 YEARS ESTABLISHED.

The Oldest and Most Reliable Safe Manufacturing Firm in the Dominion.

New Goods! New Goods! New Goods!

COLORED GOLD SETS, DROPS, PINS, LOCKETS AND RINGS.

Our New Goods in the above are the neatest and most tasty ever imported. Our Mr. Anderson has just returned from the European and American Markets, where he has personally selected our Fall Stock.

AMERICAN JEWELLERY. AMERICAN JEWELLERY.

We are still Head-quarters on the Newest and Latest Styles in American ROLL PLATE CHAINS NECKS and NOVELTIES.

A. C. ANDERSON & CO., Hamilton.

SPECIAL NOTICE.

BETTER THAN EVER!

Always Ahead! Buy the Best!

SHEFFIELD STERLING SPOONS & FORKS,

The best unplated flat-ware ever manufactured.

GUARANTEED TO RESIST ACIDS, KEEP THEIR COLOR AND IMPROVE WITH USE.

Every dozen done up in guarantee wrapper. They are the best goods for Dealers to handle because

They are Elegant in Pattern, and Reliable in Quality, Easily sold by the Dealer,

AND GIVE SATISFACTION TO THE BUYER.

Don't be imposed on by imitations, or "Goods as good as Sheffield Sterling," but get the genuine article from the Co.'s Canadian Wholesale Agents

ZIMMERMAN, McNAUGHT & LOWE.

All great pageants have their lubicrous side. At the last at Windsor, the "beef-eaters," in scarlet and gold, with their knotty joints protruding in all kinds of shapes beneath their white silk hose, their sad and sorrowful countenances contrasting with the wreath of red and white roses encircling the round flat cap of black velvet belonging to their costume, their stiff white ruffs standing out against their sturdy beards and wrinkled chin—all presented a mirth-inspiring aspect which would have been most precious to an caricaturist. In solemn silence they stood before the buffet where the $2,000,000 worth of gold plate was piled up, with Tippo Sahib's footstool, a tiger's head of gold, with eyes of rare and brilliant gems, and that cynical monarch's golden bird, whose eyes are of diamonds so brilliant that they seem to light every object aronnd, and whose claws are of pearl, pronounced by Rundell & Bridge, the great jewelers of the last generation, as being too valuable for any London goldsmith's tools to touch.

Another Monster Bell.—St. Paul's Cathedral, London, will at an early date be provided with a new bell, that may well rank among the monster bells of the world. It was cast on the 23rd day of November last, in the factory of M. Taylor, of Loughborough. The smelting occupied 8½ hours, and the casting, four minutes; but only after six days the cast was sufficiently cool to issue from the mould. The dimensions of the bell are, height, 2.692 m.; diameter, 2.896 m.— (0.91 meter=one yard). It has not yet been weighed, but it is presumed that it may be classed between the bell of Olmutz (18,182 kilog.), and that of Vienna (17,980 kg.). Next comes that of Erfurt, 13,960 kg., of Seus, 13,200 kg., and of Paris, 12,190 kg. The St. Paul Bell will cost about 75,000, francs in which is comprised the cost of putting it *in situ* in the northwest steeple of the church

An Indian Bronce.—The Hindoos possess a remarkable ability for making alloys of iron, copper, zinc and tin. Let us cite the *biddery;* the alloy is called after the city where it is mostly prepared, and is most encountered in its purity. The eminent qualities of this alloy are, that it is non-oxidizable in air, even if the latter is charged with humidity, under the burning tropical sun. It is ferfectly malleable and does not crack, except, perhaps, by violent blows. Objects of art manufactured from this alloy, are colored black by plunging them into a simple solution of saltpeter and sal ammonia, or sea salt and blue vitriol. One receipe for preparing the alloy reads as follows: 16 parts copper, 4 lead and 2 tin, melted together. Zinc is combined with this mixture in a proportion of 3 to 10. Dr. Hamilton gives another formula: zinc, 126 parts; copper, 460; lead, 414 (without tin). These parts are finely broken, and enclosed in a crucible with a mixture of beeswax and resin, to prevent calcination, and to simply effect fusion. The fusing alloy is run into an earth mold, and shaped into the desired form. To give it a black color, a solution of sulphurate of copper is used.

Correcting Brittle Gold.—As soon as a gold ingot shows sufficient ducility to withstand the first two or three annealings without breaking, and if by the effect of this first test it gives indications of brittleness, by the appearance of cracks and fissures upon its surface, resourse must be had to a sort of mold casting, what the French call "brassage." This operation is easily performed. It consists in taking a soldering coal, sufficiently large to receive the ingot, preparing it thus with a file that a deepened half-round hollow is worked in. The ingot is now heated upon a coal to nearly white heat, and in this condition it is laid upon the prepared coal, and covered with borax at all points, to faciliate the melting, which is about to be undertaken; the thus prepared ingot is exposed to the influence of a heavy wick of the soldering lamp, and by aid of a somewhat long blowpipe, the flame is directed upon one end; the fire is maintained until the surface begins to melt, whereby all cracks disappear, without raising the temperature sufficiently, however, to either shorten the ingot or separate it into several parts. The requisite degree of heat will be recognized, as soon as the bar begins to give way, and begins to conform to the smallest angles of the coal, as well as by the rainbow hues which begin to appear upon its surface, and finally, by the union of the cracks, which dipappear in proportion as the angles of the bar conform to the angles of the coal, under the heat of the flame. When the ingot has reached this degree of heat, in its entire extent, the operator may be assured of its malleability.

The Watchmaker, Jeweller and Silversmith,

A Monthly Illustrated Journal. Published in London.

The Representative Organ of the Watch, Jewellery and Kindred Trades in the United Kingdom.

It is full of original information and thorough practical instruction contributed by the leading writers on the various subjects connected with the above trades. The text is well illustrated by wood-cuts, and two supplements of artistic designs for jewellery, etc. accompany each number.

This important Trade Organ, now in its seventh year of publication is in the hands of every British Watchmaker, Jeweller and Silver smith, and is therefore a most valuable medium for manufacturers requiring publicity in Great Britain.

Our list of eminent contributors includes such names as: Baker, Henry Ganney, Moole, Richard Whitaker, Herrmann, E. J. Watherston, W. Ingmann, J. Hamilton, and is an ample guarantee for the sterling value of the journal. Subscription 5s. per annum.

Published by A. FISCHER, 11 Saint Bride Street, London, E. C., England.

NICKEL

SHOW CASES FOR SALE.

In consequence of their removal the undersigned have For Sale Very Cheap, Five First Class Nickel Show Cases, made by Millichamp, of Toronto. The Cases are square shaped, 12 feet long, 30 inches wide, and 20 inches deep, with Handsome Stained Stands. Are suitable for Fancy Goods or Silver ware. Cases and Stands cost $116. Will be sold for $80 cash.

Can be seen at the Wharehouse of

ZIMMERMAN, McNAUGHT & LOWE,

6 WELLINGTON ST. EAST, TORONTO.

THE WATCHMAKER

And Metal Worker

Is the official Journal of the

Watchmakers and Jewellers,

of the North west,

CONTAINING 56 PAGES OF

Illustrations and Reading Matter.

Whose columns are replete with choice articles upon Horology, Watch-making and repairing, written for this Jonrnal by practical and scientific men; also a large amount of general information of vital importance to the trade; also continued articles, or lessons in letter engraving, written by a celebrated engraver of this city. Subscription price, $1.50 per year. Single copy, 15 cents.

THE LARGEST

Clock House

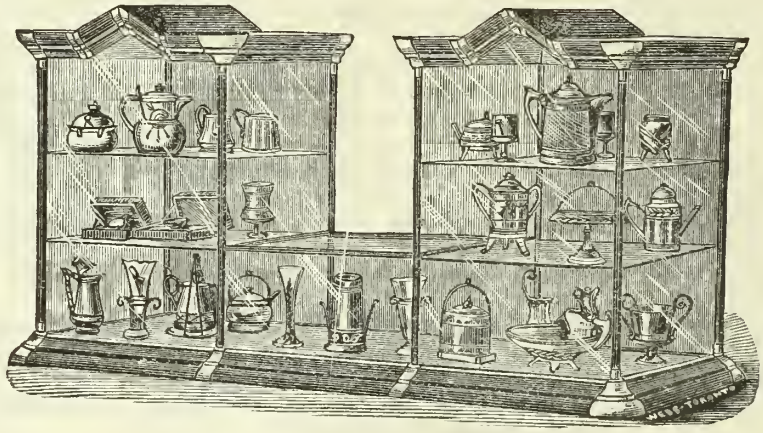
IN CANADA.

I beg to direct the attention of the trade to my large assortment of Clocks, from the following celebrated manufacturers, viz.:

SETH THOMAS, WELCH.
GILBERT AND ANSONIA,
INGRAHAM

I keep these Clocks in every style now manufactured, and show 200 different varieties of samples, besides Regulators of all kinds.

I will sell, only to the Trade, any of the above makes of American Clocks at prices lower than any house in Canada, and will guarantee to meet any competition either in quality, style or price. Also a large variety of Ladies and Gent's Swiss Watches, Gold, Silver and Nickel Cases, Key and Stem Winders.



SAMUEL STERN,

Sole Agent for SETH THOMAS' CLOCKS,

GOODS RETURNED.

Very few merchants, wholesale or retail, like either the principle or the practice of sending out saleable goods on approbation. But through the exegencies of business it has occasionally to be done, and this being the case the less trouble it makes to the dealer sending out the goods the better he will like the transaction. Any one at all conversant with the details of running a live business, knows that it is not a profitable thing for any merchant to send out saleable goods on approbation or sale. If he made a practice of doing such things he would certainly require double the amount of stock, for as a rule nearly one half of it would be away on approbation the whole time.

No live merchant cares about this kind of thing, it don't pay, and because it don't pay, it is seldom or never done unless by way of accommodation to some good customer, whose trade is worth the sacrifice. If the magnitude of the sacrifice were fairly estimated by the retail dealer, we are strongly of the opinion that the transaction would be attended, in many cases, with far less inconvenience to the wholesale merchant than is now the case. As a matter of fact many retail dealers treat this matter of approbation goods as if it were entirely a matter of right, and not a favor given by the wholesaler in order to oblige him, and it is mainly because of this way of looking at it, that this custom, right enough in itself, has become such a nuisance that many of the best houses on the continent have decided to abolish the practice entirely.

In fact in many cases this habit of getting goods on approbation has become so scientifically managed that by a judiciously worded "identical note" to half a dozen wholesale houses a very large and well assorted stock of goods are secured, from which the retailer can make his sale. While there may be nothing dishonest about such a transaction, it is hardly the square thing, to say the least of it. It is a kind of "getting goods under false pretences," a kind of business that should be discouraged by every possible means. As a matter of fact approbation goods should be a rare thing in a retail dealer's store, and when they are got they should be dealt honestly by, and any unsold ones returned as soon as possible.

We are sorry to say that this is not always the case, and that goods obtained in this way are sometimes used simply as a foil to help to sell the dealer's own stock.

Although in the present state of trade in this country it is inevitable that goods must occasionally be sent out on approbation, it is well however for retail dealers to remember that the use of a few simple business rules when returning such goods not only helps to facilitate matters but makes the transaction in every way more satisfactory.

Many persons when returning goods, simply do them up in a parcel and express or send them by post, without even notifying the house in any way that they may have done so. The result is that when the goods reach the wholesale dealer, there is neither mark nor means of any kind to help to identify the party from whom they come, and as a consequence they are often put into stock without being credited to the party sending them, and the mistake is never discovered until the sender raises a row about an error in his statement of account, which when examined turns out to be the omission of the unnotified goods.

Surely this mistake arises from want of thought, for no dealer can imagine for a moment that the wholesale merchant does business with no one else than himself, and therefore must of necessity know that the goods received came from him. The effect is the same however—it is annoying to the wholesale man and causes him much extra work, and if not properly credited it ultimately becomes annoying to the retailer by throwing his account out of gear, and rendering it troublesome to adjust.

If retail dealers would follow the few simple rules we give below they need never fear having any trouble about their goods not being properly credited, and we are certain it would make it so much easier for the wholesale dealers that they would be much more willing to grant a similar favor when again called upon to do so. The rules are as follows:

(1) In sending back goods, in addition to the name of the house to whom they are sent, the name of the sender should always be marked upon the outside of the case, so that when they come to hand there can be no mistake as to where they came from.

(2) An invoice should at the same time be sent to the house giving the particulars of goods sent, prices, how shipped, and any other particulars it is necessary to give.

(3) Goods got on approbation should be returned as soon as possible, and not allowed to lie around the retailer's store for weeks; they should either be returned or kept for good, and the wholesale merchant notified forthwith.

Nothing is more annoying to a wholesaler than when he draws on a customer for goods sent out weeks or months before to have them returned with a note stating that they did not suit. In conclusion we need only add that while we do not doubt that this kind of trade is at times necessary, its practice might be very much curtailed with decided advantage to both wholesaler and retailer. Much or little as it may be done however, the above rules if followed will make it more agreeable to both parties to the transaction.

RAILWAY MONOPOLY.

From present indications it seems probable that before many months pass over our heads, we shall virtually have but two railroads in Canada, the Grand Trunk and the Canada Pacific.

The present is an age of monopolies, and although they are not the same as formerly secured by favouritism or special and unjust legislation, they are none the less dangerous. There is scarcely any limit to the possibilities in the way of monopolies that may at present be secured

by aid of the almost unlimited combination of capital that can be effected. A good instance of this may be seen in the recent amalgamation of the Grand Trunk and Great Western Railways. These roads have been rivals ever since their construction, and their competition has in no small measure helped to advance the interests of the people of this country, owering the rates of inland and outward bound freight. In their passenger traffic also they have always shown an inclination to keep up the full rates, except at competing points, in which cases they invariably brought them to an even figure, no matter what the difference would have been at the ordinary rate charged. All this was of course brought about by opposition, and the healthy rivalry thus created did the public very much good, while it did the railroad companies little or no harm.

All this is now to be changed however, and in place of opposition and cutting of rates we are to have fusion and monopoly, and as a consequence a tightening of the screws as far as they can legitimately be turned. By their recent amalgamation the Grand Trunk and Great Western shareholders have virtually placed the people of this province at their mercy, and if they are as soulless as corporations are usually represented to be we shall not be long in feeling the effects of the change.

In fact in many places both the freight and passenger rates have already been advanced to more profitable figures for the railroads, and it is only a question of time when it will become general all along the line.

The necessity for a Railway Commission appointed by parliament to look after the rights of the people is becoming every day more apparent, and cannot be ignored much longer. Such a commission has been found necessary in Great Britain, and we think that they could find plenty of work in Canada in putting down the abuses connected with the railway management as at present practised.

CANADA'S GREAT FAIR.

As we confidently predicted in our last issue, the fourth Industrial Exhibition of the City of Toronto proved a greater success than any of its predecessors, and the management and the citizens of Toronto may be fairly congratulated on the splendid success they have achieved. This, the greatest of Canada's fairs, has already grown to be a recognized institution throughout the country, and it is hardly premature to say that its successful inauguration and steady prosperity has sounded the knell of the perambulating system of exhibitions heretofore in vogue in this country.

We have previously expressed in these columns our conviction that the day of itinerant fairs was past, and that although they had served a good purpose in the early days of our development, that they had outlived their usefulness, and should, therefore, be quietly relegated to some honorable niche in our agricultural museum.

If the head pushers of that almost defunct institution could be brought to realize that their pet show had outlived its usefulness, and that the sooner they throw what little energy they possessed into some live concern the better it would be for themselves and the country at large, they would have made long ago a step in the direction of advancement. But, singular to say, they still cling to the idea that they, and only they, are able to run such a gigantic concern as a Provincial Exhibition, and that if they were to let it go by the boards the British constitution would be endangered. They fail to see that in this age of electricity and steam their Government pap fed nursling is wholly unfit to compete against the healthy, wide-awake stripling that private enterprise has set up against it. They also fail to see that they are not keeping abreast with the spirit of the age, and that the people do not now see the propriety of subsidizing an institution that is always financially embarrassed, and one, moreover, whose work can now be accomplished, not only better, but without any expense to the country at large.

As a matter of fact, these great central fairs, which are the direct outgrowth of commercial rivalry and friendly competition, are so far in advance of the old provincial, that one can only wonder at the blindness which prompts the continuance of the latter. In an exhibition such as the Toronto Industrial one, where the buildings and other improvements are permanent, it can be easily seen that there is a great incentive for improving and beautifying it year by year. All this is entirely altered in the perambulating system where a great deal of money is expended upon a concern that exists only for a few days at the most and then destroyed, or left to return to its former natural state. You might as well expect to get as good protection from the sun from a lot of saplings planted each year and left in the ground for about a month, as from a grove of healthy growing shade trees which had seen both the storms and sunshine of half a century.

By the action of the directors of the Provincial last year in forcing themselves upon Toronto for the avowed purpose of killing its Industrial Exhibition, the last link in the chain which bound that valuable institution to this city was severed, and whatever be its ultimate ending, it is now practically defunct as far as Toronto is concerned.

We are sorry to notice a growing feeling of jealousy between the other large cities of Ontario and the Capital of the Province. They seem to think that Toronto's growth must mean their decay and that this city should go quietly to sleep and let every other place get the start of it. If Toronto goes into anything in a spirited manner they at once raise the cry of monopoly and centralization, and try to induce the public to beware of her grasping and selfish designs.

This should not so be. The Queen City of the West is no more selfish than any of its decriers; perhaps if the truth were told, hardly so much, but she is bound to keep in the van of Canadian intelligence and enterprise, and if by reason of her population, wealth and other attractions, she is able to make a success of what has hitherto proved a financial failure, her public spirited citizens should be praised instead of censured for it. This Industrial Exhibition is entirely an outgrowth of private enterprize, and now that its promoters have demonstrated to the country that such things can be run to pay without drawing on the public exchequer, their example ought to be imitated by many of the surrounding cities.

The large measure of success that the exhibition has met with this year, will no doubt have the effect of making the promoters put forth more vigorous efforts in the future, and there is every probability of the next year's fair outstripping all its predecessors in point of attractions and attendance. Its prize list, now the largest of any exhibition in the Dominion, is being increased annually, and it is no utopian idea to hope that before our exhibition is a quarter of a century old, it will have grown into such a vigorous manhood as to be recognized as one of the great attractions not only for Ontario alone, but for the whole of the Dominion.

Selected Matter.

THE LIEN LAW.

The dullness of the building trade in Toronto, there is ground for believing, is due in great part to the additional stringency which was given to the law of mechanics' liens, last session of the Ontario Legislature. This measure designed to afford a sort of paternal protection to mechanics in the building trades, is having economically a very different effect, if it be true that its mere existence has largely diminished the amount of building in Toronto and other places. Should the mechanics become convinced of this, it is probable that they will ask to have the severity of the law mitigated. The extent of the danger to money lenders is probably magnified in their own imaginations ; but the effect is the same as if the danger was greater. At least seventy-five per cent. of all the buildings erected in our cities is due to borrowed capital ; and any thing which, checking the movement of this capital, greatly diminishes the amount of building must be injurious to mechanics as well as to others interested. Indeed, the blow must be felt more severely by the wage-receiving class than by any other ; for enforced idleness means to it a drying up of the sources of existence, while to others it means only a suspension or at most a loss of profit. Any thing which diminishes the employment of capital, is injurious to the capitalist.

It is very desirable that mechanics should come to look upon this matter in its true light, and whenever instances occur of this law preventing the erection of buildings, the fact should be brought under their notice. The alterations of the law will probably depend very much upon the mechanics themselves; for neither political party is likely to take, unasked, any step that might cause the loss of the workingmen's vote.

The principle of a lien on the thing on which work is done is by no means new to the English law, though its operation is far from being universal. But between the old and the new lien there is a great difference. When a blacksmith claims a lien on a horse which he has shod, he simply uses an extraordinary remedy for collecting a debt from a man by whom it is owing. To such a lien as this—a lien which does not interfere with the rights of third parties—there can be no objection. But it is different when a third party is called upon to pay a debt which he never contracted, and to meet the demands of men with whom he has had no transaction. If it be necessary to assert such an exceptionable principle, its operation should be confined to the narrowest limits, and it should never be invoked to prevent the natural consequences of the negligence of the parties making the demand. Mechanics' liens we suspect of American origin ; but in the United States, owing to the salutary rule that no state can pass any law impairing the obligation of contracts, their operation is strictly limited. No law can be passed by any state of the American union which would take away, in any contingency the rights of a mortgagee. Everywhere contracts ought to be held sacred, where the means of carrying them out exists. We trust the Mechanics Lien law will not long be allowed to remain in its present unsatisfactory condition.—*Monetary Times.*

ALCHEMY.

[JEAN PFAFFRATH, *Journ. d. Goldsh.*]

By the name of alchemy is understood the art of changing baser metals into noble ones, such as, for instance, tin into silver, or copper into gold. The word alchemy comes from the Arabian *Cham*, the eye, this being the symbol of the secret, and chemistry penetrates into the hidden secrets of nature. *Al* is the article.

It may safely be assumed that gold is the oldest of all metals known to man, from the fact that it often occurs in a metallic state, and, stranger to say, is found in almost all parts of the globe. As gold is easily beaten and fashioned, not attacked by the common oxides, rust, verdigris, etc., it was from early stages adopted as standard for money. From this period forward, the cravings of man were directed upon its possession, as not alone purchasing the sustenance of life, but exchangeable as an equivalent for all its luxuries and enjoyments. Hence forward, the motto was, Gold; to obtain it was the sole object of all acts and deeds of man; gold was the enchantive rod, by the possession of which, everything could be accomplished; gold was the powerful ruler, before whom humanity bowed; gold purchased all desires upon earth, and with gold, blessedness of the future state itself could be purchased; gold was the theme of the poet, the preacher, the king, the beggar, and it is no wonder that the desire arose to produce it artificially.

It is probable that the conception first arose in the artisans of the races of antiquity, who observed that an alloy differing in color, texture, grain, etc., could be produced from two metals, say, for instance, copper and tin, from which arose a goldlike mass. According to the ancient and universally spread tradition, Hermis Trismegistes is said to have been the thrice greatest of all the founders of the Black Art. But doubt exists as to who he was. Some believe him identical with King Siphoas (2,000 years B. C.), others assume him to have been a son of the god Anubis (equal to Mercury of the Greek and Roman mythology) ; he generally is set down as a sage and high priest, 2,500—2,700 B. C He is said to have written more than 36,000 volumes on the alchemic and magic sciences, to have been the inventor of the gold test upon the touchstone, invented the alphabet, and several other useful sciences. His name has been preserved up to the present day, for instance, *hermetical*. Whether he was a tangible or merely an imaginary personage cannot now be decided, at any rate, all fables and traditions point to Egypt as the cradle of alchemy.

The alchemists, also called adepts, called all metals "sick gold." The further its properties were removed from those of gold, the "sicker" they were. Copper was not as sick as tin, and silver was almost well. For curing the infirmity they thought it necessary to have a material, a panacea, that must contain the primary substance of all things, whereby it had the power to dissolve all other metals into their primary components. If the metals could be decomposed at will, they might also be recomposed at will, and the missing ingredient, characteristically belonging to gold, either by melting or in any other manner, might be supplied to any other metal, in order to transmutate it into the genuine gold. This primary substance of gold was called the "stone of the sages," "lapis philosophorum," "menstruum universale," the "Great Elixir," the "Great Magisterium," the "Red Lion," the "Red Tincture," the "Philosopher's Stone." It was imagined to be a preparation of a compact body and red color, and if only the smallest particle were added to another fluid metal, it cured its

infirmity and changed it into genuine gold.

Some of the adepts also took the word "sickness," in its real meaning, and deemed the philosopher's stone to be a universal panacea curing all diseases, retaining the body in health and strength, and prolonging life to the hundredfolds of its natural limits. Hence it is often called the Panacea of Life, and Potable Gold, *aurum potabile.*

In every epoch and nation, if it arose to any eminence, we find Alchemists; the Spaniard, under Pizarro, found them even among the Peruvian priests.

From Egypt, it went to Greece; although history has preserved the name of no Greek adept; and in common with all sciences and arts, it soon made its way to the Romans. During the time of the most senseless luxury under the tyrants, when all the treasures of the world were wasted recklessly at Rome, gold was often wanting, and the pretended discovery of the transmutation of metals was hailed with joy, by which gold was promised in boundless proportions. Emperor Caligula, 37—41 A. C. instituted such experiments. Diocletian, 285—304 A. C. on the contrary, ordered that all books treating on the art of gold-making should be burned. Since, however, the persecution of an idea, always contributes to spreading it, we find alchemy flourishing about this time. The suppression, however, effected that the adepts enveloped their science in a mysterious fold, they called themselves the "hermetical chain," and in aught bearing on their art expressed themselves in mysterious representations and language. At a subsequent date, the alchemists found it of advantage to retain this secretmongery, in order to shroud their secrets from the vulgar.

The signs and names used by them to designate the seven old metals, were as follows:

Gold, ☉ Helios.	Silver, ☽ Selene.
Mercury ☿ Mercurius.	Copper, ♀ Venus.
Tin, ♃ Jupiter.	Lead, ♄ Saturn.
Iron, ♂ Mars.	

Which symbols have been retained in metallurgy until the present day.

About this time also arose among the adepts the so-called Theurgy, that it, the power, by mysterious ceremonies, to summon the departed, and to press them into service, when the master could compel the spirit to reveal to him all secrets, especially the preparation of the Philosopher's stone. To do this, the most horrible crimes against the life of a fellow-man was often committed, the quintessence requisite for this ceremony was human blood; because it was even then well known that "blood is a peculiar juice."

After the destruction of the Roman Empire, the art flourished in the Byzantine. Later it was adopted by the Arabs, who, together with other sciences, raised it to a high standard. The first Arab who wrote of Alchemy, was the doctor and chemist Geber, in the eighth century, in whose works already occurs a method for mercury preparations. The most celebrated of all Arabian chemists was Lullus; according to his system, all metals consist only of sulphur and mercury; correctly proportioned, all metals might be composed of these two ingredients—also gold (not alone Zinnabar.)

During the middle ages, the monks were often occupied with Alchemy, although it was forbidden by the Popes; the Franciscan friar, Berthold Schwarz, as is well known, in one of his alchemical experiments, invented powder. But we find adepts even among the Popes; John XXII, and many churchmen high in authority, dabbled in the goldmaker's art. Among the temporal rulers, also, we find seekers for the Great Magisterium, Rudolph II., German Emperor, 1576—1612. In general, the adepts found their warmest supporters during the middle ages in the both great and small potentates, for the simple reason that they always found themselves in a chronic state of impecuniosity, and thought to obtain the much coveted prize quickest through these alchemists. What of it, if, after having been disappointed by them, they should deal out summary punishment—the rack and the gallows. Thus the adept John F. Bottcher, druggist, was kept imprisoned by his Saxonian ruler, and barely escaped death, when in the place of the philosopher's stone, he discovered the Meissen porcelain. Frederic I., of Prussia, caused an alchemist, because he was not successful in the transmutation business, to be suspended from a gallows decorated with gold paper.

The most celebrated adept of the middle age was friar Basilius, a monk, living in Erfurt, in the 15th century. His system rested upon salt, sulphur and mercury, (*sal, sulphur, et mercurium*). In the 16th century we find the celebrated Swiss doctor, Paracelsus; in the 17th, Beuther, in the court of August I, of Saxony, sharing the fortunes of most of the alchemists, who entered into princely service. He was tortured, maimed, and imprisoned for life. The Dutch Dr. van Helmont, who in the enthusiasm for the art, christened his son "Mercurius," who also died an adept in 1699. Dr. Helvetius, who was at first a bitter enemy to alchemy, but finally died one of its most devoted followers. Kunkel, who discovered the ruby glass and phosphorus, and many others might be named.

The researches, extending over 4,000 years, of these adepts have led to the most important discoveries and inventions in the field of chemistry, technic, and medicine. The first raised the condition of the people, and the latter has reduced sickness and disease to a minimum, and prolonged life, therefore the Philosopher's stone has been partly discovered, but in another form than was imagined by the alchemists.

There may have been many frauds and pretenders in the guise of alchemists, a few really are said to have been able to transmutate baser metals into gold, for instance, a stranger caused such a transmutation in presence of Helvetius, who thereupon changed his opinion. That there were as many cheats among the adepts as history records, is undoubtedly one of its well known lies; a person who lived as retired as they did, only in communion with and in pursuit of his idea, with but few necessities, like the majority of adepts, is generally no cheat and swindler.

THE TRIBULATIONS OF A CONSCIENTIOUS EDITOR.

(Jewelers' Circular.)

Candor and professional pride compel us to affirm that all editors are conscientious, truthful and honestly intent serving their fellow men. Some of them, however, are wofully tempted to stray from the path of rectitude—not for filthy lucre, for that your true editor scorns, but through the intensity of his ambition to do just the right thing, oblige his friends, and extend a helping hand to impecunious but deserving merit. He is more often misled through his good-heartedness and human sympathy than other cause. We have had editorial experience with all classes of journals—daily, weekly, monthly, semi-occasional, political, religious and profane, but nowhere have we experienced

such trials and tribulations as beset the pathway of the editor of a trade journal. In the conduct of *The Circular* we are actuated by the highest motives, and seek to promote the best interests of the legitimate trade; our ambition is to make an art journal, not only elegant in its typographical appearance, but that shall contain such instructive articles as shall stir the ambition of all persons who honestly seek to advance the arts of the goldsmith, the watchmaker and the jeweler, and make them emulous of better things than have heretofore been accomplished in their respective fields of labor. In this publication it is necessary, in addition to instructive articles treating of the technicalities of the business, for us to give to the news transpiring in trade circles, and to comment editorially upon the varying conditions of the business; in short, to give such information as shall be of value commercially to the merchants in the trade, as well as to its artisans. This we seek to do in a dignified manner, abjuring personalities, seeking to offend no man, but striving to tell the truth fairly, squarely and manfully.

No one, however, who has not attemted to conduct a trade journal, can imagine the difficulties interposed to swerve us from our purpose. For instance, we pen an editorial exposing the unbusinesslike practice of certain jobbers, who seek to cultivate, by surreptitious means, a retail trade, and so rob the retail dealers of that patronage to which they are justly entitled, when forthwith some jobber who feels that the cap fits him, writes us an indignant letter, threatening to withdraw his patronage and use his influence against us. Not content with abusing us, he assails the retail dealers, declares they do not pay their debts, that they are unscrupulous in their dealings with the public, palming off bogus goods for genuine; he charges them with being responsible for the degradation of the quality of goods by their constant demand for cheaper articles, and, in fact, holds them responsible for all the ills the trade is heir to. On some other occasion we read the retail dealers a lecture on the bad practises of which they are guilty, and forthwith we are overwhelmed with indignant protests from dealers, who declare that the articles are inspired by unscrupulous jobbers, and that the paper is "run" in their interests and that of watch companies. If rumor is to be believed, every advertiser in the paper is its sole proprietor, while the gentleman whose name appears as editor and proprietor is a mere figure head, and his position is that of a cheap clerk. This, however, is comparatively trifling; they are annoyances that every editor has to submit to, and go to verify the old adage that he who tries to please everybody will please nobody. The special province of a journalist is to criticise, and he must expect to be criticised in turn; but if he be honest, and manfully maintains his convictions, his opponents will respect and sustain him, however much they differ from his expressed views.

The greatest difficulty the editor of a trade journal has to contend with is the bitterness engendered by active rivalry in business, and spirited competition. It is unfortunate that active, energetic rivalry generally degenerates into bitter personalities. Misrepresentation of one another's goods is a practice frequently indulged in, and crimination and recrimination result. Both the contending parties are probably friends of the editor, and patrons of his paper; each, therfore, feels that he has a right to demand that the influence of the paper shall be employed in his behalf to expose the alleged rascality of his rival. They forget that the general readers of the paper care nothing for their petty personal quarrels, but insist that its columns shall be used to gratify their private animosity. Knowing the parties to the quarrel to be honorable men in their private capacity, the judicious editor refuses to parade their grievances before the public, or to prostitute his paper to the level of an individual organ. That competition is good for trade is unquestionably a fact, as the adage says, but when one seeks to build up his own trade by misrepresenting the goods of a competitor, he passes the bounds of legitimate competition, and becomes absolutely dishonest. Misrepresentation of this kind is exposed sooner or later, and is sure to react upon the person indulging in it. A salesman who disparages the goods of his competitors, declares them to be degraded in quality and fraudulent in construction naturally invites a closer inspection of the articles he himself is offering, and the intending purchaser soliloquizes to himself, "if those other travellers were liars, how can I believe this one?" More ill feeling is engendered in the trade by indulgence in this kind of misrepresentation and back-biting than from any other cause. And the worst of it is, the editor of the trade journal must listen to all these grievances, and is expected to take both sides in the quarrel. How to steer his craft successfully past Scylla, escape Charybdis is a problem that has caused many a hair in the editor's head to turn gray, and he expects to be carried to an untimely grave and leave it still unsolved.

An important function of the the trade journal is to notice all new inventions or devices that are introduced in that branch of business to which he caters. In the jewelry trade, for instance, if a manufacturer obtains a patent for a new style of ring or pin, or designs a new form of setting for precious stones, it is a legitimate part of our duty to note the fact, and pass criticism upon the merits of the goods, and, where necessary, to speak of the enterprise of a person to whom the trade is indebted for a novelty. We do this gratuitously and cheerfully as a matter of news. But scarcely will the item be printed before a score or more persons come clamoring for a notice of their goods, which have neither the merit of newness nor originality. They argue that they patronize the paper as well as he whose new device was noticed, and are as much entitled to a "puff" as he. They fail to recognize the difference between a deliberate "puff," the giving of which we seek to avoid, and a notice of something new and desirable, of which the trade knows nothing. The one is a legitimate piece of news, while the "puff direct" is a fulsome piece of flattery, given without just cause or provocation, and is as discreditable to the person named therein as to the paper printing it. Items of news, even though they involve personal mention, belong to the legitimate sphere of journalism, while puffery does not. But there are many persons in the trade who seem to feel that if they patronize a paper, they are entitled to frequent notices in reading matter columns. No such obligation is imposed upon the editor by the advertising contracts entered into. Those call for advertisements, and the advertiser gets the worth of his money through the circulation of the paper. But some men are so eager to see their names in a notice that they get indignant when the editor refuses to insert "puffs" of them. We could sell

our reading columns every month at liberal prices, but can truthfully say that never, since *The Circular* was established, has an article in its editorial columns been paid for. Advertisers may say what they please in their business cards, but their patronage cannot influence the expression of our editorial opinions.

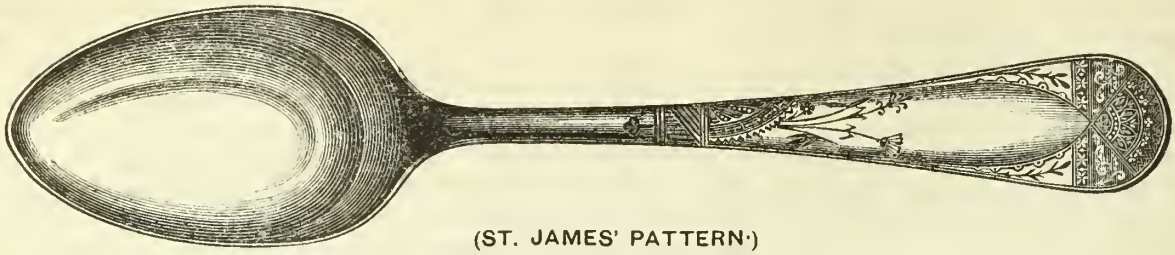
A daily journal caters to the multitude, and is naturally oblivious of special interests; the trade journal, on the contrary, caters to a special interest, and ignores the general public. Within his special field the editor of the trade journal finds a great variety of individual interests, clashing at times like Chinese cymbals, and he is a skillful pilot who can steer his craft so successfully as to avoid all the breakers. The difficulty lies with his patrons, who, each seeking his own personal welfare, ignore the general interests of the trade at large, and who regard everything as an attack upon themselves unless it harmonizes with their views. Judging from the advice we receive from one and another, we are sometimes inclined to think that the editor of *The Circular* is the worst possible that could be found for the position. Yet we keep right along in the even tenor of our way, maintaining the stand we took at first, to seek to promote the interests of the entire trade, and not those of individuals; if in so doing individuals are benefitted, we rejoice at their success, and feel thankful at having been permitted to contribute to it. As a moral to this article, we desire to suggest that our critics strive to view matters pertaining to the trade from our disinterested standpoint before writing us denunciatory letters; sink your individuality for a moment and consider the welfare of the trade in general; then, as you believe in the sincerity and honesty of your own purposes, give us credit for the same qualities. You may differ from our conclusions, but at least admit that we may be honest in them.—(We say amen to the above.—Ed. TRADER.

We propose to publish from time to to time, extracts from the very valuable work recently published by Mr. Edwin Streeter, of London, England, on the historic diamonds of the world. The particulars relating to the "Koh-i-Noor," and the "Pitt or Regent" diamonds will be especially interesting to every person acquainted with the crown jewels of England and France.

THE KOH-I-NOOR.

I

EARLIEST HISTORICAL FACTS ABOUT IT.



"This is pre-eminently the 'great diamond of history and romance.' Its stirring adventures, when divorced from all connection with Travernier's Great Mogul, become intelligible enough. The first distinct and authentic reference to the Koh-i-Noor occurs in the subjoined passage from the 'Memoirs of Sultan Baber,' the author of which was a direct descendant of Tamerlane, the founder of the so-called Mogul Empire in Hindustan. Under the date of May 4, 1526, the Sultan writes:

"'Bikermajit, a Hindu, who was Rajah of Gwalior, had governed that country for upward of a hundred years. In the battle in which Ibrahim was defeated, Bikermajit was sent to hell. Bikermajit's family and the heads of his clan were at this moment in Agra. When Humaiun arrived, Bikermajit's people attempted to escape, but were taken by the parties which Humaiun had placed upon the watch and put in custody. Humaiun did not permit them to be plundered. Of their own free will they presented to Hamaium a "peshkesh," (tribute or present,) consisting of a quantity of jewels and precious stones. Among these was one precious diamond, which had been acquired by Sultan Ala-ed-din. It is so valuable that a judge of diamonds valued it at half of the daily expense of the whole world. It is about eight mishkels. On my arrival, Humaiun presented it to me as a peshkesh, and I gave it back to him as a present.'

"That the diamond here referred to is the Kok-i-Noor there can be no reasonable doubt, nor indeed has the fact ever seriously called into question. It will be noticed that although he speaks of it as already 'famous,' Baber gives it no particular name, and it did not take its present designation till it passed into the hands of Nadir Shah. The illustrious historian mentions, however, that it 'had been acquired by Sultan Ala-ed-din,' which enables us to trace its existence some 200 years further back. The Ala-ed-din here spoken of belonged to the Khilji dynasty, which succeeded that of the Ghuri, and which ruled over a large portion of Hindustan for 33 years, from A.D. 1288 to 1321, when they were replaced by the Toghlaks. Ala-ed-din Khiliji had obtained possession of the 'famous diamond' in the year 1304, when he defeated the Rajah of Malwa, in whose family it had been as an heirloom from time out of mind. One tradition carries it back to the somewhat legendary Vikramiditya, and ancestor of the Rajah of Malwa here spoken of, and of Baber's Bikermajit, Rajah of Gwalior. This Vikramaditya flourished in 57 B.C., and is said to have driven the Saca (by whom are no doubt meant the Scythians) out of India. But no value can be attached to the tradition, which is evidently sort of an afterthought suggested by the similarity, or rather identity, of the two names Likermajit and Vikramaditya. At the same time the association is significant, as it serves to show that the gem was at all times regarded as the property of the Rajahs of Malwa, who are sometimes spoken of as the Rajahs of Ujein and Gwalior; for all these places were formerly included in the territory of Malwa which has since been subdivided among the states of Bhopal, Indore and Gwalior—the dominions of Scindia. We now understand how it happened that the diamond, after being acquired by the Sultan Ala-ed din in 1304, is found in the possession of Bikermajit, Rajah of Gwalior, in 1526. It had evidently been restored to Bikermajit's family by the Khilji ruler, after peace had been established between the two states.

"A still more obscure and extravagant tradition identifies this stone with one discovered first some 5,000 years ago in the bed of the Lower Godavery River, near Masulipatam, and afterward worn as a sacred talisman by Carna, Rajah of Anga, who figures in the legendary wars of the Mababharata. That such a stone should have been found in such a place is likely enough, as it may well have washed down to the delta of the Godavery, which flows through one of the oldest and richest diamantiferous regions in the world. But its identification with the stone under consideration rests on no solid foundation, nor will it readily be believed that a gem which remained unnamed till the eighteenth century, could be unerringly traced back to prehistoric times.

"Its subsequent history from the time when it fell into the hands of Baber to the present day is inseparably associated with many of the most striking and romantic events of modern days. But, to quote Maskelyne, though 'one long

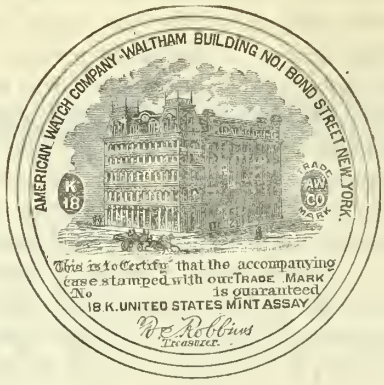
romance from then till now, it is well authenticated at every step, as history seems never to have lost sight of this stone of fate, from the days when Ala-ed-din took it from the Rajah or Malwa, five centuries and a half ago, to the day when it became the crown jewel of England.'

"Bernier tells us that, on the death of Shah Juhan, Aurung zeb 'set out immediately for Agra, where Begum Sahel received him with distinguished honor. On arriving at the woman's apartments, the Princess presented him with a large golden basin full of precious stones, her own jewels and those which belonged to Shah Jehan.' The Princess here referred to was Jihanira, the too well-beloved daughter of Shah Jehan, who remained with him to the last, and who had used her influence to prevent him from destroying his jewels rather than surrender them to Aurung-zeb, as mentioned in our account of the Great Mogul. It is uncertain whether Baber's diamond was one of those contained in the golden basin, or whether it had already been given to Aurung-zeb during his father's life-time. The former supposition seems to have been the most probable; for among Aurung zeb's treasures exhibited to Tavernier, Nov. 3, 1665, there was only one diamond of great size—the Mogul—and Shah Jehan, already afflicted by a fatal disease, died in the following February. But the point is of little consequence, as in any case the stone remained in the possession of the Mogul dynasty until Nadir Shah's invasion of India, during the reign of Mohammed Shah, in 1739."

II.

HOW IT GOT ITS PRESENT NAME.



"In our account of the Orloff diamond it was stated on the authority of Whittaker that Aurung-zeb made use of the Koh-i-Noor as one of the eyes of the peacock, adorning his Peacock Throne, and that Nadir carried off and broke up his throne, thus gaining possession of the famous gem. But according to another and apparently more trustworthy account, when he seized on the Delhi Treasury, this stone, which he was bent on securing, was found to be missing, and for a long time all his efforts to obtain it were baffled. A last a women from Mohammed's harem betrayed the secret, informing Nadir that the Emperor wore it concealed in his turban, which he never on any occasion laid aside.

"Nadir had now recourse to a very clever trick in order to secure the coveted prize. Having already seized on the bulk of the Delhi treasures, and concluded a treaty with the ill-fated Mogul Emperor, he had no further pretext for quarreling, and could not, therefore, resort to violence in order to effect his purpose. But he skillfully availed himself of a time-honored Oriental custom, seldom omitted by Princes of equal rank on state occasions. At the grand ceremony a few days afterward, held in Delhi for the purpose of reinstating Mohammed on the throne of his Tartar ancestor, Nadir suddenly took the opportunity of asking him to exchange turbans in token of reconciliation, and to cement the eternal friendship that they had just sworn for each other. Taken completely aback by this sudden move, and lacking the leisure even for reflection, Mohammed found himself checkmated by his wily rival, and was fain, with as much grace as possible, to accept the insiduous request. Indeed, the Persian conqueror left him no option, for he quickly removed his own national sheepskin head-dress, glittering with costly gems, and replaced it with the Emperor's turban. Maintaining the proverbial self-command of Oriental potentates. Mohammed betrayed his surprise and chagrin by no outward sign, and so indifferent did he seem to the exchange, that for a moment Nadir began to fear he had been misled. Anxious to be relieved of his doubts, he hastily dismissed the durbar, with renewed assurances of friendship and devotion. Withdrawing to his tent he unfolded the turban to discover with selfish rapture the long-coveted stone. He hailed the sparkling gem with the exclamation Koh-i-Noo, signifying 'Mountain of Light.'

'At Nadir's death most of his treasures were dispersed, but the Koh i-Noor, henceforth known by this title, passed, together with many other jewels, into the hands of his feeble son and temporary successor, Shah Rohk. On him it brought nothing but misfortune; yet he clung to it with amazing tenacity, refusing to part with it under pressure of the most atrocious tortures including even loss of sight. After his overthrow he had been permitted to reside at Meshd, as Governor of that city and district. Hither he brought the Koh-i-Noor, together with many other gems of great value, which formed part of the plunder carried off by his father from India. Aga Mohammed, who had an insatiable appetite for such things, determined to get possession of them, and in order the more easily to effect his purpose, he advanced with a large force toward Meshd, under the pretext of visiting the sacred shrine of the Inam Riza, which is annually resorted to by many thousands of Shiah pilgrims. He thus succeedes in quitely occupying the city. After performing his devotions at the tomb of the saint, suddenly throwing off his disguise, he ordered the blind Prince to deliver up his concealed treasures. As the infatuated Shah Rokh still protested that he had already parted with them, he was ordered to be put to fresh torture, which had the effect of bringing to light several costly gems. But as neither the Koh-i-Noor nor the immense ruby known to have been in the crown of Aurung-zeb were among them, Aga Mohammed devised a truly diabolical expedient to get hold of them. He ordered his victim's head to be closely shaved and encircled with a diadem of paste, and boiling oil to be poured into the receptacle thus formed. But even the frightful agony of this torture could only induce the victim to surrender the ruby. He still retained his hold of the great diamond. The miserable monarch never recovered from these injuries. Before his death, Ahmed Shah, founder of the Afghan Empire, came to [illegible] his army, in 1751, concluded an alliance with [illegible] and received in return the fatal [illegible] whose brilliancy could no longer relume the lack-lustre eyes of Shah Rokh.*

"Possession of the unlucky gem proved no less disastrous to the Durani dynasty than it had to the Mogul Emperors and to Nadir's family. At his death Ahmed Shah bequeathed it to his son and heir, Taimur Shah, who removed the seat of government from Kandahar to Kabul, and who died in 1793. From Taimur it descended, with the crown, to his eldest son, Shah Zaman, who was disposed and deprived of his sight by his next brother, Shah Shuja-ul-Mulk. The usurper thus became possessed of the Koh-i-Noor, which he retained almost to his death; but which, nevertheless, involved him in an uninterrupted series of calamities and sufferings. After having remained for many years concealed in the wall of

[illegible] display-silver goods [illegible] inary kind. this enter-brought [illegible] ie City

a stronghold, where Shah Zaman had been confined, the diamond was brought to light by the merest accident. Shah Zaman had, as we supposed, securely imbedded it in the plaster of his prison wall. But in course of time a portion of the plaster crumbled away, leaving one of the sharp angles of the crystal exposed, or slightly protruding on the surface. Against this, one of the officials happening to scratch his hand, his attention was attracted to the spot, his eye fell on the sparkling facet, and the Koh-i-Noor was once more rescued from its hiding-place. At all state ceremonials Shah Shuja now wore it on his breast, where it glittered when Elphinstone was sent by the Indian Government as Envoy to Peshawur during that Prince's troubled reign."

III.

LAST DAYS OF ITS CAREER IN ASIA.

"In his turn dethroned, deprived of his sight, and driven into exile by Shah Mahmud, third son of Taimur, Shah Shuja had contrived, amid all his disasters, to retain possession of the great diamond, with which he now withdrew to the Court of the famous Runjit-Shingh, the 'Lion of the Punjaub,' accompanied by his brother, Shah Zaman, whom as stated, he had himself already rendered sightless, according to the brutal fashion of the Durani Court.

"Rujit at first received the two ill-starred brothers with open arms, and even declared war on their behalf against Shah Mahmud, from whom he took the territory of Kashmir, which at that time formed part of the Afghan dominions. He, however, not only forgot to restore their possessions to the unfortunate brothers, but began to oppress them in every way, and to extort from them all the treasures they had brought away from Kabul. Among these the Koh-i-Noor was coveted more than all the rest, and Runjit spared no efforts to get hold of it. How he at last effected his purpose is thus related by Kluge:

"'Driven from Peshawur to Kashmir, and hence to Lahore, Shah Shuja became apparently the guest, but in reality the prisoner, of Runjit Singh, who, though no connoisseur of precious stones none the less attached great importance to their possession. Of the Koh-i-Noor he had heard only by report, and employed every means to secure it. Wuffo-Begum, consort of the unhappy King, had also sought and obtained protection from Runjit, and was consequently now residing in Shadra. Runjit ordered her to deliver up the stone, which, however, she protested was not in her possession. Thereupon he caused all her effects to be seized and brought to Lahore, thus acquiring jewels of greater value than any he had ever possessed before. Supposing that the Koh-i-Noor was among them, the bulk of the property, including shawls, carpets and gems, was retained, and a few trifles returned to the Begum. But soon ascertaining that the Koh-i-Noor was not to be found among the jewels, he had the Begum closely watched; two of her most intimate attendants were thrown into prison, and the other members of the Zenana deprived even of bread and water. No one, without being first searched was allowed to approach or leave the Princess, and it was at the same time intimated that nothing but the surrender of the diamond would satisfy Runjit. Thereupon the Begum sent him some very costly stones, and among them a ruby of considerable value. Having, as stated, no personal knowledge of gems, the tyrant of the Panjaub now fancied that this ruby, which surpassed anything which he had yet seen, must be the real stone. But, in order to make assurance doubly sure, he sent for a person acquainted with the Koh-i-Noor, placed all the stones before him, and said, "Which is the Koh-i-Noor?" He received answer that it was not among those gems, which, compared to it, were of little value. This made him all the more eager to procure it, and he again began to treat the Begum and her family with great harshness. After keeping them without food for two days, finding that she still held out, he gave up the hope of bringing her to terms by such means, and had recourse to more insinuating ways. She now promised to give up the stone, provided Runjit released Shah Shuja from captivity in Kashmir, and conferred a life pension on him, besides sundry favors on herself and friends. Shah Shuja was liberated at once, but some of the conditions not having been fulfilled, the Begum declared that the stone was not in her keeping, but that it had been pledged to a merchant in Zandahar. Ranjit thereupon returned to the former coercive measures, and the Princess was once more deprived of food, but all to no purpose. At last Shah Shuja himself volunteered to surrender the stone, and a time was fixed on which he promised to produce it.

* Early in 1751, Ahmed was recalled to Mesh by the revolt of Mir Allum Khan, (Aga Mohammed) Chief of Kauin, who had seized on the treasure at Meshd and blinded and dethroned Shah Rokh Murza. Ahmed restored Shmed Rokh and soon after took Kauin and put Mir Allum to death. Elphinstone's "Kabul," page 579. But according to other accounts Shah Rokh had already been blinded before the events here related.

(To be continued.)

BUSINESS CHANGES FOR SEPTEMBER.

Hexton Bros, Lindsay, Hardware, assigned in trust; J. Trotter, Toronto, Tins, &c., dead; G. M. Butchart, Rapid City, Man., Hardware, deceased; Arms & Quigley, Toronto, Watch Case Manufacturers, have dissolved, R. J. Quigley continues alone; Woltz Bros., Toronto, Jewelers, dissolved, John Woltz retiring, Jacob F. and George continue under same style.

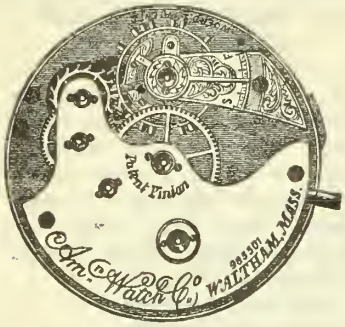
BUSINESS NOTES.

THE fastest trip across the Atlantic is now claimed for the *Alaska* of the Guion Line, namely, six days, fifteen hours, twenty minutes.

ORDERS to the amount of some $70,000 have been received in Montreal from Australia, principally for railway supplies, including two parlor cars such as are in use on the North Shore R. R.

GEORGE TODD, a jeweler and watchmaker, having been in business at Newcastle, N. B., a couple of years, has failed, and assigned in trust to E. P. Williston. Liabilities small, and assets still more so.

THE other day we were shewn a curiosity in the shape of a gold chain just made to the order of a Winnipeg jeweler by the firm of Zimmerman, McNaught & Lowe. It was an 18 K., fine trace pattern guard, weighing almost 200 dwts. of gold. Somebody up in that direction had surely struck a bonanza in corner lots.



BURGLARS have been giving trouble to storekeepers in central Ontario. Jno. McRae & Co's. store at Beaverton was broken into, the safe blown open, and seven watches abstracted but no money. At Bethany, Armstrong's store was entered and the safe blown open, $50 being stolen besides some promissory notes.

THE new show cases lately received by Messrs. Zimmerman, McNaught & Lowe, for showing their silverware, are pronounced by all who have seen them to be the finest kind going for displaying this class of goods. They make silver goods look doubly as attractive as the ordinary kind. Retail dealers should take a leaf out of this enterprising firm's book.

THE Winnipeg excursion last week brought to this city the greatest part of the Prairie City jewelers. Among them we noticed Mr. Thompson, Mr. Ormond, Mr. Radford and Mr. Fowler. Although some of them thought that Toronto was a very quiet little city, they seemed to take kindly to our monotonous way of living to enjoy themselves thoroughly.

THE silverware exhibit of the Meriden Britannia Co. at the late Toronto Industrial Exhibition was very fine, and deservedly attracted a great deal of attention. The Company went to the trouble and expense of removing their show cases from their factory to the exhibition, and the result was highly satisfactory both to the public and the Company themselves. The exhibition goods were disposed of *en bloc* to Messrs. Zimmerman, McNanght & Lowe, the well known wholesale jewelers, of Toronto.

NEVER play practical jokes on a customer, no matter how well acquainted you may be with him. He will have his revenge by going somewhere else to trade.——Do not praise the

ties of any article more than it will bear. Boats are often sunk by being overloaded.——Persuading a customer to buy goods when he does not need them, is an unprofitable operation in both parties.——"Didn't think" will cause just as many troubles for the clerks to-day as it did before the telephone and electric light were invented.——The clerk who knows more about business than his employer, is a much scarcer individual than the one who thinks he knows more—*Talks to Clerks*, by P. F. Felker.

Several merchants are known to have lost their lives on the unfortunate steamer *Asia*, which foundered last week in the Georgian Bay, during a gale, when out of some eighty souls on board, only two are known to have escaped. Among these merchants was Mr. A. Duncan, wholesale dry goods merchant, of Hamilton. Mr. Duncan came to this country in 1858, and engaged with Messrs. Adam Hope & Co., of London, remaining in their employ until the firm removed to Hamilton, when he became a buyer. He was associated with the old firm of Messrs. Buchanan throughout its numerous changes. Since 1878 he has been the leading partner of the wholesale house of A. Duncan & Co. He was largely interested in manufactures as well, being a shareholder in the Ontario Cotton Company, Hamilton Knitting Company. Mr. Duncan was esteemed in mercantile as well as social circles. Messrs. H. B. Gallagher, and J. H. Tinkiss retail storekeepers at Manitowaning, lost their lives by the disaster. A nephew of the latter, and a Miss Morrison are, according to the latest accounts, the only survivors of the wreck. Another victim was Mr. Wm. Henry, who had lumber mills at Mudge bay. By a sad coincidence, Mr. Henry's brother was drowned at the burning of the *Manitoulin*, the steamer which was replaced by the *Asia*.

WORKSHOP NOTES.

To Remove Rust.—If you immerse the articles in kerosene oil, and let them remain for some time, the rust will become so much loosened that it will come off easily.

Diamond Files.—Shape your file of brass, and charge with diamond dust, as in case of the mill. Grade the dust in accordance with the coarse or fine character of the file desired.

Cleaning-pith.—The stalk of the common mullen makes the best pith for cleaning pivots. The best time when to gather it, is winter, when the stalk is dry. Some use cork instead of pith, but it is inferior.

To Frost Watch Plates.—Watch plates are frosted by means of fine brass wire scratch brushes, fixed in a lathe, and made to revolve at great speed, the end of the wire brushes striking the plate, producing a beautiful frosted appearance.

To Case-harden Iron.—If you desire to harden to any considerable depth, put the article into a crucible with cyanide of potash, cover over, and heat altogether, then plunge into water. This process will harden perfectly to the depth of one or two inches.

To Draw Temper.—If you wish to draw the temper from part of a small steel article, hold the part from which you wish to draw the temper with a pair of tweezers, and with your blowpipe direct the flame upon them—not the article—till sufficient heat is communicated to the article to produce the desired effect.

To Temper Clicks, Ratchets, etc.—Clicks, ratchets, or other steel articles, requiring a similar degree of hardness, should be tempered in mercurial ointment. The process consists in simply heating to a cherry red and plunging into the ointment. No other mode will combine toughness and hardness to such an extent.

To Temper Gravers.—Gravers and other instruments larger than drills may be tempered in quicksilver, or you may take lead instead of quicksilver. Cut down into the lead, say half an inch, then, having heated your instrument to a light cherry red, press it firmly into the cut. The lead will melt around it, and an excellent temper will be imparted.

Restoring Watch Dials.—If the dial plate is painted, clean the face off with spirits of wine, or anything else that will render the dial perfectly clean; then heat it to a bright red, and plunge it into a strong solution of cyanide of potassium, then wash in soap and water and dry in box dust. Repeat if not a good color. India ink, ground with gum water, will do for the figures.

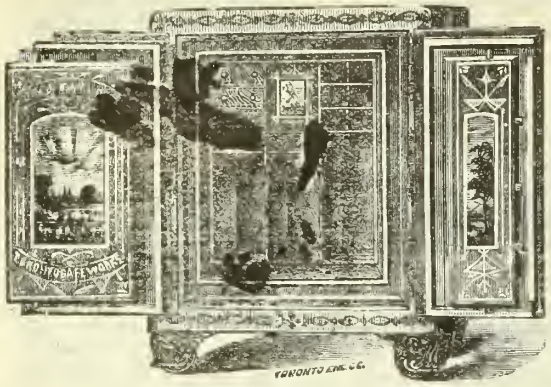
To Blue Screws Evenly.—Take an old watch barrel and drill as many holes into its head as you desire to blue screws at a time. Fill it about one-fourth full of brass or iron filings, put in the head, and thus fit a wire long enough to bend over for a handle, into the arbor holes—head of the barrel upward. Brighten the heads of your screws, set them point downward into the holes already drilled, and expose the bottom of the barrel to your lamp till the screws assume the color you wish.

Jeweling.—In using the broaches, press but lightly upon the jewel hole, and turn the broach rapidly with your fingers. For polishing, use a bone or ivory point lightly coated with the finest diamand dust and oil, and, while using it with the one hand, accompany the motion with a slight, oscillating motion of the other hand, in which the jewel is held. This will insure a more even polish to the hole, with less liability to press the jewel out of its place in the plate, than if held firm and steady.

To Temper Drills.—Select none but the finest and best steel for your drills. In making them, never heat higher than a cherry red, and always hammer till nearly cold. Do all your hammering in one way, for if, after you have flattened out your piece, you attempt to hammer it back to a square or round, you will ruin it. When your drill is in proper shape, heat it to a cherry red and thrust it into a piece of resin or into mercury. Some use a solution of cyanuret of potassia and rain water for tempering their drills, but the resin or mercury will give better results.

SCIENCE NOTES.

According to the London *Times*, Mme. Modjeska wears in a ring a large diamond, cut with a flat face and rising with a spring. Under it is a portrait of her son. She calls the ornament her two jewels." Mr Modjeska doesn't seem to cut much of a figure in the family.



The smallest circular saw in practical use is a tiny disk about the size of a five-cent nickel, which is employed in cutting the slits in gold pens. They are about as thick as ordinary paper, and revolve some 4,000 times per minute. Their high velocity keeps them rigid, notwithstanding their extreme thinness.

The progress of the great bell for St. Paul's cathedral from Loughborough to London was followed with an interest somewhat short of that following the movements of Jumbo, but still with interest. The bell, which weighs nearly seventeen tons, has been transported a hundred miles on a car with a traction engine. After sticking in the mud several times, and having to be protected from the people, who insisted on scratching their names on the surface, it has arrived safely, and will soon be placed in the southwest tower of the great cathedral and add its terrific E flat to the numerous other noises of London.

The Princetown, N. J., telescope of twenty three inches aperture nears completion. Its object-glass was finished and approved more than a year ago, and the spectroscope was received from London last autumn. The work upon the mounting, clock-work, and accessories, has been going on steadily at Cambridge, and in Princeton the preparations for receiving the instrument in the Halstead observatory are nearly finished. Though a little smaller than the Washington telescope, and considerably smaller than the enormous instruments now constructing for Poulkowa and Nice, it will be one of the great telescopes of the world, and abundantly powerful for the work it is designed for—stellar spectroscopy.

Short-sightedness has increased to so great an extent among the youths at the great government schools in France, that a committee was appointed some time ago to enquire into the subject. In their report, which is now published, the committee point out that in their opinion the cause of the prevalence of the infirmity is to be found in the fact the school books are printed in type which is too finely cut; and further, that the custom of printing upon white paper is still more hurtful. It is recommended, therefore, that the authorities will consider the advisability of substituting thicker characters in the books, and also of printing in white letters upon tinted paper.

The most valuable diamonds are not those which are entirely colorless, but those known to merchants as "blue-white." Of blue diamonds, the finest known is the "Hope," valued at $150,000, and formerly in the collection of Henry Thomas Hope, of England. This is in color of a beautiful sapphire blue, and there are only three or four other diamonds known in Europe which can really be termed blue. The only known specimen of a red diamond is now in the hands of a great connoisseur residing in London. It weighs about three grains, and is valued at $4,000. The finest green diamond—a pure emerald green—is the property of a West End, London, merchant, and weighs about four grains. There is no other stone known at all, approaching this for depth of color. It is valued at $5,000. Diamonds that contain a slight tinge of color are numerous, but have no special value.

ZIMMERMAN, McNAUGHT & LOWE.

A CORRESPONDENT of the *Engineer*, London gives information of the fact that watch making by machinery is a growing industry in Birmingham, England. At the factory of the English Watch Company, of Villiers street, London, there is as much as 500 feet of pulley shafting. Among much delicate machinery there is a milling machine, a wheel-toothing machine, and a drill as fine as a human hair for the regulator holes. One valuable automatic, whose construction the firm keep private, is an apparatus for the cutting at one operation, of a dovetail slot and dovetail "jewel-slip" over a jeweled hole. The cutter, set by a micrometer gauge, and running at 2,000 revolutions per minute, can cut a hair stretched upon a jewel without touching the stone itself. The firm claim to employ the most minute steam-power lathe work in the world for turning the tiny balance-staff pivots for the jewel holes. The company report considerable success in the competition which they are carrying on with American and other machine-using watchmakers. Last year the company secured the contract for watches on the Indian State railways.

ONE of the results of the late disastrous war waged in South America, has been the sale of a large number of gold and silver church ornaments set with precious stones, and old personal jewelry sent from Lima by patriotic persons, in order to procure funds towards the defence of Peru. Of nearly 500 lots, which realized various prices, the following were sold at the highest rates: A pair of long pearl and diamond ear rings, with four large Oriental pearl buttons, and a pair of extraordinary large pearl drops, £235; a curious silver gilt mitre, enriched with scrolls of diamonds, emeralds, rubies and other stones, £273; a magnificent old chased fine gold monstrance, enriched with a large number of precious stones, including fine emeralds, rubies, sapphires, diamonds and amethysts, likewise pearls, total weight, 378 oz. 10 dwt., £2,000; an old gold monstrance, with a centre of large diamonds and topazes, with rays of diamonds, rubies, and topazes, £940; fourteen gold rays for a monstrance, set with topazes and diamonds, £640; a gold crescent of eighteen brilliants, £200; an old silver-gilt monstrance, with a gold door and lining, 298 oz. 10 dwt., £200; a life-size silver figure of a pelican, with an enamaled gold breast, the eyes and aigrette set with large emeralds cut *en cabochon*, three silver-gilt figures of young pelicans, £380; an old enameled frame in three pieces, enriched with emeralds, £275. Total of the prices, £10,778.

THE London *Times* describes a recent trial of a new musical instrument invented by Mr. Bailie Hamilton, which resembles in shape and in the means of producing sound, the harmonium or cabinet organ. There is, however, one important difference. Mr. Hamilton employs what is technically known as "free reeds," but instead of acting upon them singly, he divides them into groups of three, connected by a bridge, which so modifies their individual sounds as to emit a single note of great sonorous beauty and power. To each group of reeds belongs a sounding-box or cavity through which the air passes much as the breath in singing passes through the throat, the intention being to produce a quality of tone resembling the human voice. In this attempt Mr. Hamilton has been remarkably successful, by means entirely different from those employed in the "vox humana" stops of ordinary organs. The timbre of the new invention varies somewhat between the voice and the softer wind instruments, such as the French horn, clarionet, etc., partaking of the qualities of both, the beauty of the sustained notes being indeed remarkable. The chief defect of the instrument is its slowness of speech, which makes the execution of rapid passages a matter of extreme difficulty, if not impossibility. This drawback, however, does not appear to be structural, and may no doubt be remedied in subsequent specimens.

THE "Man About Town" in the Buffalo *Sunday News* is responsible for the following: "'Do you know that lady?' I asked of a friend who lifted his hat as we were passing along the avenue the other day. 'I ought to know her,' was the answer, 'when I gave her a gold dallar, for a button, on her dress.' I had noticed the gold buttons, and I learned later that each one bore the monogram of some devoted admirer. More than that, as I learned on the best authority, this lady had made a practice of asking each of her admirers for a monogram dollar for the purpose. And I am told it is quite a common custom. It is a very popular idea as far as the ladies are concerned, but I can't say that the young men I have talked to like it. They say it too communistic, and the conpliment isn't worth the cost. The coin is only a dollar, but it costs from $1.50 to $2 to have it smoothed down, and the monogram of giver engraved on it, and sometimes more, and when done the giver is not specially honored, but put on a par with a dozen or so of other fellows, each of whom is similarly mulcted. If it was a locket or ring or some other one-of-a-kind trinket. I doubt not any gallant youth would go to the bottom of his pocket with great heroism if not pleasure, but there's no distinction in this button scheme, and any one of a dozen admirers is as much honored as the best of the throng. The girls like the trophies, however, and suppose they will get them whether their admirers really like it or not.

Editorial.

FAILURES FOR 1882.

In spite of our abundant harvests and other circumstances favourable to national prosperity, it is apparent that the tendency to speculate recklessly is on the increase, and that if it is not promptly checked, we shall ere long have another of those periods of depression, which are the inevitable results of overtrading.

We are no alarmists, but with every confidence in the present stability of the country and its future prosperity, we may say that in many quarters we notice a growing tendency to carry too much sail, a state of affairs which, if persisted in, must result in embarrasment and final disaster.

If anything were wanting to confirm our views of the commercial outlook, the bankruptcy returns given below would surely furnish substantial proof. The figures are as follows:—

THIRD QUARTER OF 1881.

No. of Failures.	Amount of Liabilities,
130.	$787,889.

THIRD QUARTER OF 1882.

No. of Failures.	Amount of Liabilities.
166.	$1,715,982.

NINE MONTHS OF 1881

No. of Failures.	Amount of Liabilities.
479.	$4,690,747.

NINE MONTHS OF 1882

No. of Failures.	Amount of Liabilities.
537.	$5,832,552.

From this it will easily be seen that the number of failures during the nine months of the present year exceed those of the same period in last year by 58 in number, and $1,141,805 in amount. This is hardly the worst feature of these figures however, for they indicate that in spite of an assured good harvest and consequent prosperous trade that the bulk of their failures occurred in the third quarter, the number being 36 and the amount $928,093.

"The increase in the number of failures, though not sufficiently great to be alarming, is full of warning to speculators, for such are, no doubt, the majority of those who have lately gone to the wall. With the return of prosperity the mad haste to be rich seizes on multitudes, and proves their ruin. They incur liabilities beyond their means, trust their all upon a throw of the dice, and a slight rise in the money market or a slight decline in their specialties is sufficient to bring them to the ground. In the United States the proportion of increase in liabilities is relatively larger for the nine months of the year than for the last three. The reverse is the case in Canada. Here out of a total increase of 58 in the number of failures for the nine months 36 belong to the last three, and out of the total increase of liabilities of $1,141,805 the tables show that $928,093 belong to the last quarter. Thus it appears that while the worst stage of the speculating fever has passed in the States, and business is becoming soberer and safer the reverse is happening in Canada. It is to hoped that the effect will be found to have culminated during the third quarter of the year, and that the returns for the fourth will show an improvement. Meanwhile the lesson is plain. Let our merchants and other business men avoid speculation and give their energies to legitimate business and failures, will be few. It is in striving to grasp too much that so many lose their all."

IRREGULAR CUSTOMS ENTRIES.

A great deal of annoyance and loss of valuable time is experienced by Canadian wholesale importers, especially those dealing in jewelry, on account of the careless way that American shippers have of sending goods to this country.

The average Yankee, smart as he may be in general matters, finds it extremely difficult to get the fact through his head, that Canada is an independent country, and not a mere state belonging to their great and glorious Union. Although perfectly cognizant of the tribute levied by the United States' customs, he fails to comprehend that any such kindred institution exists on this side of the line, and as a consequence, his shipping of goods is a very mixed and muddled piece of business.

Perhaps it would not be very wide of the truth to say, that there are not in all the myriad exporters of the United States, one hundred of them who know how to ship goods properly to this country.

Many of them have been told how to do it a score of times, but still with presistent carelessness, or worse, they will insist on pursuing the even tenor of their way, and shipping as before.

Tell them that invoices should always be sent *in duplicate* by mail, and never enclosed with the goods themselves, and they think you are joking; they send bills in packages in the States, and because it suits their home customers, they seem to imagine that everybody else also should be satisfied. For the information of any such, we may here say that the Canadian importer has to leave one invoice with the customs' authorities when he enters his goods, and the other is necessary for his own use.

Some firms send one invoice by mail and enclose the other in the package. This should never be done, because the importer not being aware that it is there, or if he is, not being sure of getting it, is compelled to make a duplicate for his own use before he puts the original out of his possession. The name of the sender should always be marked on the outside of the package, as it will often help the importer to decide what goods are waiting for entry, without the trouble of getting a permit to examine them.

Then again, a great many shippers have a habit of enclosing sundry small packages sent there for packing, without notifying the consignee that they have been so enclosed, and the result is, that when such a package comes to be examined, the enclosures on which duty has not been paid, on account of the ignorance of their presence by the importer, are seized, and a great deal of worry and trouble are occasioned before the error can be rectified.

Such things are not only very annoying, but in many cases actually damaging to the importer, who, though he may be

entirely innocent of any complicity in the affair, has yet to shoulder some share of the odium attached to having goods seized for want of being entered.

Shippers enclosing packages should always make a memorandum on the bottom of their own invoice of any such enclosures. Such a memorandum will save a great deal of worry, annoyance and probably loss, as it enables the importer to tell at a glance what goods are in each package. As we said before, although American exporters have been warned time and again about the danger of such absurd ways of shipping goods but few of them pay any regard to it.

The Canadian customs' authorities recogizing the fact that the fault rests mainly with the shippers, have decided in future to enforce the law which enables them to seize all goods not mentioned in the invoice, or any goods that are improperly invoiced for the purpose of evading the payment of the full amount of duty.

This we imagine, is about the most thorough and practical way of bringing such people to their senses, and we are satisfied that when any of these gentlemen once get a package seized and confiscated, they will for ever after that event have a thorough recollection that Canada is a separate country, and has customs' laws which have to be complied with.

If this lesson can be thoroughly learned, by the loss of a fifty or one hundred dollar package of goods, it will probably be cheap enough at the price, and certainly the Canadian importer will have no cause for complaint, seeing that he will be benefitted by its application, and that the consignor will have to foot the bill.

The customs' officials will now be doubly on the alert to detect enclosures, and "such like," and no doubt they will be happy to *initiate* American exporters at the rate of fifty or one hundred dollars per head into the mysteries of Canadian customs' laws.

We think, however, that prudence should dictate a strict adherence to the customs' laws of this country, and thus at once make it easier for the importer to whom they sell the goods, and safer for themselves.

In order that there should be no misapprehension upon this subject, we give below the full text of the circular referred to, and would merely add, that in all such matters "a word to the wise is sufficient."

CUSTOMS DEPARTMENT,

Ottawa, 6th October, 1882.

Sir,

In consequence of the very frequent discovery of enclosures, which are not noted in the invoice or entry, in packages sent for examination, I am desired by the Minister of Customs to furnish you with the following copy of the fiftieth section of the Customs' Act relating thereto, with instructions to distribute the same generally to all the principal importers of goods at your port, not only for their own information, but that they may communicate the same to their correspondents in foreign countries and in Great Britain, with a view to the future prevention of this most dangerous practice :—

"40 Victoria, chap. 10, sec. 50 :

"The Collector shall cause at least one package in every invoice, and at least one package in ten, if there be more than ten in any invoice, and so many as he or any appraiser deems it expedient to examine for the protection of the revenue, to be sent to the warehouse, and there to be opened, examined and appraised,—the packages to be so opened being designated by the Collector ; and if any package is found to contain *any goods not mentioned in the invoice, such goods shall be ABSOLUTELY FORFEITED*, and if any goods are found which do not correspond with the description thereof in the invoice, and such omission or non-correspondence appears to have been made for the purpose of avoiding payment of the duty or of any part of the duty on such goods, or if in any invoice or entry any goods have been undervalued with such intent as aforesaid, or if the oath made with regard to any such invoice or entry is wilfully false in any particular—then, in any of the cases aforesaid, all the packages and goods included or pretended to be included, or which ought to have been included in such invoice or entry, shall be forfeited."

By this it will be seen that the mere fact of an enclosure being found, which was not mentioned in the invoice under which the package under examination was entered, the goods so enclosed are *absolutely forfeited*, and no room is left for the consideration of extenuating circumstances.

I am, Sir

Your obedient servant,

J. Johnson,
Commissioner.

Selected Matter.

"A GOOD FELLOW," AS A GROCER.

Mr. Joseph Brown was as well acquainted and had as many friends, as friends are usually reckoned, in the village in which he lived as any other man in the place. So familiar was he with the townspeople, or rather they with him, that he was commonly known as "Jo" Brown. No man was better natured than he, and his assistance was always asked, and never in vain, in any undertaking from a church festival to a Fourth of July celebration which might occur in his little city. If any one was in trouble, Jo would help them in some way, and for doing good deeds to the poor his name was, no doubt, often recorded by that guardian angel which is said to watch over the destinies of each individual.

In fact, Jo was a "good fellow" in the eyes of all the people, and everybody wished him well. So, when he purchased the stock of a retiring grocer and started in business for himself, his friends predicted an unusually successful career for him. He was such a good fellow and had so many acquaintances that he was certain to have a "big trade" from the very start. Jo, no doubt, had about the same opinion of his success, for he was promised trade enough to turn the head of a much less sanguine man than himself; and if goodness in this world is to be rewarded he thought he stood a pretty good chance. He had injured no man as far as he knew, and he might have been of benefit to many ; he had cast his bread upon the waters, and now he thought the time had come for the prophetical part to be fulfilled.

And so, with bright visions of coming wealth, poor Jo opened his grocery. We use the adjective poor on purpose ; for the revelations which came to him in the course of time were a severe shock to his faith in human nature, for a half-dozen *dead beats* in a town is sufficient almost to bring every man, woman, and child under a cloud of suspicion. But to return to our story. Sure enough, Jo had a big trade from the very first morning he opened. It seemed as though every inhabitant in the surrounding country was among his customers. Men would come in with a hearty "Hello Joe, glad to see you in business," though he had little recollection of seeing their faces before. But of course it must be all right, so their orders would be duly taken.

His trade was fairly booming; his "friends" were true to their promises and patronized him liberally. Of course he could not refuse old acquaintances who asked "credit for a few days" just for groceries, for he was too good a fellow to serve them in that way. And so his account book soon contained the names of A——, B——, C——, D——; indeed, ran the gamut of the alphabet, while his cash entries were yet at the beginning of the scale.

Our friend Joe was indeed a popular merchant, and was a regular Charity Bank for impecunious acquaintances. To the festivals, dinners, benefits, etc., of a long line of church organizations and secret societies Jo was always a liberal giver, and the more he gave the more was expected from him. The army of "solicitors" always struck him for a good sum to head their subscription list, with the remark, "'Twill be a good advertisement for you, you know." Yes, the bread he had cast on the waters when he was a good fellow, was being returned to him—but was there some mistake in the kind of bread?

Of Mr. Brown's further business career, and his efforts to collect what was due him, we will not write at length. It is sufficient to say that in his character of a good fellow he did not make success of the grocery business, but he did learn a great deal about human nature, the depth of which he had never before sounded. How hard men will strive to get something for nothing, how many lies they will tell and to what little meannesses they will stoop to beat the groceryman out of his goods, no man can fully comprehend until he has stood behind the counter for a few years and had it revealed to him. And with this state of mind we will take leave of our friend, and simply remark that a tradesman needs to be something more than a good fellow. As Sam'l of Posen says in the play: "becsiness is beesinc.ss."—*Monetary Times.*

SENDING A TELEGRAM.

One man reached a long arm over the little crowd clustered at the operator's window, and asked for a "blank telegraphic form," explaining that he "wished to send a telegraphic despatch to his family." Now, when a man speaks of a "telegraphic despatch," I always wake up and look at him, because the cumbersome title is all at utter variance with the spirit of the the telegraph. It's too long. The use of it betrays a man who has little use for the telegraph. The more he uses the wire, the shorter his terms. The more nearly he can come to saying "msg" the more content he is. And he dosen't call it a "telegraphic form;" he asks for a "blank" black or red as the case may be. And he never "telegraphs" anybody. He "wires" them. And he dosen't explain to the operator what he wants to do with the blank. Presumably he wants to write a message.

So I watched this passenger write his "telegraphic despatch." First he asked the operator "what day of the month is this?" There was nothing unusual in that. All men ask that. It is the opening line in the regular formula of sending a "msg." He spoiled three blanks before he got a "telegraphical despatch" written to suit him. But even that is not very uncommon. A man always uses stationary more extravagantly in another man's office than he does at home. Then he wrote every word in the body of the despatch very carefully and distinctly but scrambled hurriedly over the address as if everybody knew that as well as he did, and dashed off his own signature in a blind letter style, as though his name was as familiar to the operator as it was to his own family. But even this is not uncommon.

Well, my tall man with the thin neck got along a little better than that when he handed the operator the following explicit message:

Mrs. Sarah K. Follinsbee, Dallas Centre, Iowa:

My Dear Wife: I left the city early this morning after eating breakfast with Prof. Morton, a live man in the temperance cause. I expected to eat dinner with you at home, but we were delayed by a terrible railroad accident, and I narrowly escaped being killed; one passenger was terribly mangled and has since died, but I am alive. The conductor says I cannot make connection so as to come to Dallas Centre this morning, but I can get there by 8 o'clock this evening. I hate to disappoint you, but cannot help it. With love to mother and the children, I am your loving husband.

Roger K. Foolinsbee.

The operator read it, smiled and said: "You can save considerable expense and tell all that is really necessary, I presume, by shortening this message down to ten words. We have no wire direct into Dallas and will have to send this message part of the way over another line, which adds largely to the cost of transmission. Shall I shorten this for you?" "No, oh, no," the man with the shawl replied, "I'll fix it myself. Ten words, you say?" "Yes, Sir." It was a stunner, for a fact, and the man heaved a despairing sigh as he prepared to boil his "letter" down to ten words. He sighed again after reading it through once or twice, and then scratched out "Dallas Centre, Iowa," as though everybody knew where he lived. Then he erased "early" and drew his pen slowly through "breakfast with" and "in the temperance." Then he scratched over "dinner with" and went on to erase "and narrowly escaped." And at last after much scratching and erasing and with many sighs, he came to the window and said, "here is this telegraphic dispatch to my wife. I have not been able to condense it into 10 words, and do not see how it can be done without garbling the sense of the dispatch, but if you can do it, you would oblige me greatly, as I do not wish to incur any really unnecessary expense. And with that he handed the operator the following expunged edition of his original message.

Mrs. Sarah H. Follinsbee:

My Dear Wife: I left the city—this morning after eating—Prof. Morton alive—cause I expected to eat—you at home. But we were delayed by a terrible railroad accident on the railroad. I—being killed—terribly mangled and since died; but I am—the conductor.—I cannot—come to Dallas Centre—but I can—I hate—mother and the children. Your loving husband,

Roger K. Follinsbee.

The operator smiled once more, and in his quick, nervous way that grows out of his familiar association with the lightning, made a few quick dashes with his pencil, and without changing or adding in the original message, shriveled it down to its very sinews, like this:

Saran A. Follinsbee, Dallas Centre, Iowa.

Left city 'smorning; delayed by accident; all right; home 'sevening.

Roger K. Follinsbee.

"There, that is all right," he said in the cheery, magnetic way these operators have. Fifty cents, sir; only 25 cents if we had our own wire into Dallas, sir; we'll have one next spring too; saves

you several dollars, sir. That's right, thank you." And the man went and sat down on a chair by the stove and stared at the operator until the rescuing train came along, as though he were a worker of miracle. And when he got off the train at the junction for Dallas I heard him whispering softly to himself: "Shfollinsbee—clishn smorning; nothin smatter; home saftnoon. And I knew that he was practising his lesson and had "caught on."—*Burlington Hawkeye.*

BENVENUTO CELLINI.

Four hundred years passed by before the prophecies and expectations uttered by Bishop Bernward (1008), who was the first to recognize the grand future of the art of goldsmithing, were fulfilled in a manner little forseen by him. In order to understand the epoch of which we are about to speak, it is necessary to examine history somewhat.

The crusades instilled into christendom an ardor for a creed, from which emanated the romantic spirit both in Church and knighthood, with its ecstatic, beautifying, ideal desires. As evidence of this religious sway and romantic spirit, aroso the gothic churches, the gigantically-constructed domes, within the halls of which all artists could compete, and exhibit their masterpieces wrought for the glory of God—be it in painting, architecture, carving, sculpture, bronze casting, or in the adornment of altars with works of gold or silver. Knights and priests had seen in the Byzantine Empire and the cities of the conquering Turks, the artistic works in arms and coat-of-mails, enamating from Oriental workmanship, and brought them home as patterns worthy of being imitated. In the cities, the citizens had, after ceaseless strife, obtained independence and power in guilds and armed unions; the single trades and guilds followed their vocation with ambition; commerce and trade enriched the citizens. And that spirit of romance also passed from the church and knighthood over to them, and was impressed even into their daily work. A thrifty life was visible everywhere, in which a high, exalted sense of duty mingled with a truly humane, merry and happy sensuality, giving an additional zest to life. Science was rejuvenated in their contact with the Orient, with the country of the ancient Greeks; it called into the graves of antiquity, and listened to the echo of its voice. The antique was studied again, and the spirit of the middle age threw itself on to its maternal bosom, to eagerly draw sustenance from its blessed abundance. Powerfully strove with the whole the individual genius, and with its inventions, for instance, the art of printing and copper plate engraving, produced a renaissance, a revolution within the domains of literature, art and study, which, by fresh discoveries and inventions, should open the doors to humanity, disclosing new and boundless fields and purposes.

Italy, with its rich and mighty cities, was the first to initiate this marvelous elevation. Upon the soil, on which antiquity had left a thousand and one traces and mementoes, the spirit of humanity rejuvenated quickest, promoted with the contact with its honored ancient culture. Simultaneously, many sons of the soil had grown into eminent masters of their art since the fifteenth century, and their co-operation caused the immense, ever-increasing influence upon those paths which they, as individuals, had been the first to open and to tread. Bellini and Leonardo da Vinci, Perrugino and Michael Angelo, Peruzzi, Titian, Giorgone, Bartolomeo, Rapheal, Del Sarto, Correggio, Caravaggio, inscribed their names in the stella world of immortality, and behind them, in sombre array, became visible the forms of the second race of heroes—Volterra, Bassano, Salviati, Vasari, Tintoretto, and a host of others, whose fame was destined to fill the 16th century.

And commensurate with this spiritual growth, also the goldsmiths' art strove manfully, as an art, to assume its appropriate position. Personal adornment was common; it charmed the eye of the patrician, while it educated his taste, and caused him to ever exact something more beautiful, more perfect, more pure and elevated from the goldsmith.

In such an epoch was born that man who stands as an phenomenon in the art world, who might be called the Phidias of Italy, and, reaching over an interval of two thousand years, might shake hands, as a worthy confrere, with the great Greek. It is Benvenuto Cellini, the goldsmith from Florence, the proud artistic city, where he was born at a time when his great countryman Christopher Columbus had discovered the new country.

His father, a piper, destined him to become a musician. Young Benvenuto was bound to learn the flute. But the father at an early day recognized the son's aptness for everything mechanical, and had sense enough to place no obstacles in his way, except that he had to learn the flute. He was articled with a master goldsmith, Antonio Sandro, of Florence, and after a few months, excelled his capable master. He was of a very rowdy nature, however, always giving way to his passions, and was soon forced to flee from his native city. He went to Rome, and astonished the Pope with his skill. He still wrought in smaller works, adornments, leaves, flowers, masks, medals, which, although betraying his fertility of conception and dexterity, yet caused him little to be expected as a future creator of such masterpieces. He was still a goldsmith, and happy to be one, because this guild was highly esteemed in Italy, and its members were often thrown into the company of the princes and nobility. He did not remain in Rome, but went to France, and entered Paris with the proud knowledge that a goldsmith was an artist everywhere. Already had the most excellent sculptors and architects, a Donaltello, Bruneschi, Ghiberti, Verrochio, Pollajuolo, emanated from the goldsmith's atelier, had constructed immortal works, and young Benvenuto was ambitious of imitating, yea, when he remembered Michael Angelo, who still constructed his works of gigantic proportions, he resolved to excel his patterns.

A large number of gold and silver figures, partly life size, were constructed by his hand, the last one of which, a sample of his skill, was a model colossus, the head of which, constructed separately became a wonder and a marvel to the people.

Gold and honors, offered by Francis I., of France, could not tempt him to remain in his service. In his boundless ambition, he dreamed to find in Italy, the choosen country of art, in the beautiful Florence of the Medicis, his recognition, as the greatest artist of his age, because he entertained that proud opinion of himself. He showed it by everything his skillful hand fashioned and worked, small as well as large, and he obtained this courted recognition, in spite of all the cabals and artifices of his enemies in Italy, who waged a relentless war against him, and the doubts of the Duke Cosmus I., of Medici, into whose ser-

vice he had entered since 1546. The doubts of this ruler were directed especially against his inability for the execution of the bronze statue of Perseus, with the head of Medusa, as Cosmus had ordered and Benvenuto executed in model. The latter wounded in his self-vanity, desired to show that he understood how to make it, although it was declared to be an impossibility by all art connoisseurs. How he executed his work is at large described by him, with his great self-vanity, peculiar to him, in his romantic, adventurous autobiography which also must be accounted to the great works of Cellini as a literary fact of characteristic peculiarity.

Benvenuto first made a clay model of his Persens, burned it, and covered it with wax, giving it the exact shape of the statue. He next coated the wax with a sort of earth, and burned this second coating, whereby the wax melted and ran out, leaving room for the reception of the metal between the two layers. The casting itself was to take place in a pit dug in the immediate vicinity of the furnace in his shop. Everything was carefully prepared. But the resinous pitch fire shot up in a gigantic flame in the furnace, the shop caught fire, and a part of the roof was consumed. Rain and storm raging outside, moderated the intensity of the furnace. The metals would not fuse, in spite of his endeavors. He was seized by despair, and thrown into the sick bed, leaving his workmen to continue alone the work of smelting. They were unable, and sent word to the master that Perseus was irredeemably lost.

Cellini, in high fever, sprang from his bed, rushed to the shop and furnace, in which the metal had become solid. He sent to the neighbors for dry oak wood, closed the hole of his roof with carpets and tapestry, threw metal into the smelting, and finally saw the mass at the point of fusion. Suddenly, at the moment of intensest expectation, the furnace cracked with a noise of thunder. Cellini heeded it not—because the metal was in fusion. To sustain and accelerate it, he rushed into the kitchen, fetched all his copper and tinware, over two hundred pieces, and threw them into the seething mass. Thus the casting was conducted to a successful issue, and better, even, than he anticipated. When the bright bronze statue (it is seen to-day standing in the market place of Florence, covered with a beautiful patina, the admiration of the world), was unveiled to the people, they raised a deafening cry of applause, which recompensed the artist for all his loses and vexations. "The people," he says, "did not cease to pin sonnets on my door, giving it the appearance of a day of festivity."

When presenting himself, the Duke said with great friendship: "My dear Benvenuto, you have satisfied me and the whole people, but I will requite your merits in a manner little suspected by you." The Duke kept his promise in a not very princely manner and munificence, only paying 3,000 gold florins, in irregular monthly payments, with which the artist, who had demanded 10,000 scudi, was not satisfied by any means.

Cellini lived until 1570, and created the most admirable chefs d'œuvre of his time. His funeral attested the great respect in which he was held by the people, although, as a man, he had continually lived in quarrel and strife.

Of his chased works in gold and silver, comparatively little has been preserved that can directly be traced to him; many works of art are ascribed to him wrongly on account of his celebrity. Several of his drawings are in existance. One genuine piece of his works exists—a gold salt cellar, which includes all the merits and peculiarities of the jewelers' art of the 16th century. It is said to be in Belvidere of Vienna.

He also worked with the pen, not alone his highly interesting biography, but also poems and scientific treatises. Especially to be mentioned are the two treatises on the goldsmith's and sculptor's art, in which he gives full details. They treat on jewels, their settings, niello, filigree, enamel, chased work, etc.; on bronze casting and sculpture.—*Jewelers' Circular.*

THE KOH-I-NOOR.

Continued from Last Month.

"'On June 1, 1813, the appointed day, Runjit, accompaned by several confidental friends and some experts acquanted with the stone, proceeded to Shadera, where Shah Shuja was then residing. At the ensuing interview, after both were seated, a profound silence prevailed, which neither side seemed disposed to break. An hour was thus spent, and Runjit, notwithstanding his impatience, still abstained from interrupting the solemn stillness. He, however, hinted to a confidant that he might quickly remind Shah Shuja of the object of their interview. Thereupon the latter nodded to a slave, who withdrew, and presently returned with a packet, which he placed on the carpet, at an equal distance from the two Princes. Deep silence again ensues; Runjit's impatience grows to a fever heat; no longer able to control his feelings, he directs one of the attendants to take up the packet; it is opened, and a glittering gem of unusual size is revealed, and recognized by the experts as the true Koh-i-Noor. At sight of the long-coveted prize, Runjit forgets the past, and breaks the silence with the question, "At what price do you value it?" To which the Shah Shuja replies, "At good luck, for it has ever been the associate of him who has vanquished his foes." And he might have added with equal truth, "At bad luck, for sorrow and suffering have ever followed in its wake!" But by his answer he betrayed the true secret of the mysterious reverence, akin to worship, with which choice gems of this sort have ever been regarded in the east, and till recently in the West.' Much in the same way Marbœuf, Bishop of Rennes, in the eleventh century, described, in barbarous Latan verse, the virtues of the agate, thus translated by King:

"According to the account of a trustworthy eye-witness, Shah Shugja's bearing throughout this interview was such as to command the deepest respect, and produced a marked effect on the audience. He received from Runjit a sum of 125,000 rupees, and soon after this occurrence he withdrew with his brother, Shah Zaman, to Lidianah, in British territory, where they resided for some time on an annual pension of 60,000 rupees each, and 6,000 to each of their eldest sons. Here Whittaker tells he saw them in 1821, and he adds that Runjit at that time had the diamond at Lahore, capital of the Sikh states. A Benjali shroff, or banker, named Silchurd, resident at Ludinah, having occasion to visit Lahore on the Rajah's business, asked his Highness for permission to see the jewel, which being granted, Silchurd fell on his face and worshipped the stone.

"The further adventures of this splendid gem are soon told. Runjit caused it to be set in a bracelet which he wore on all public occasions. On his

WATCHES.

Just received, a large shipment Silver Swiss Watches, Ladies' and Gents' Key and Stem Winders; also a fine line of Ladies' 10 kt. and 14 kt. Watches. Best value in the market.

JEWELLERY.

Our Stock for the CHRISTMAS TRADE is now more complete than ever before, and in connection therewith we call the attention of the Trade to the following lines, viz.:

COLORED GOLD JEWELLERY,
BRIGHT GOLD JEWELLERY,
AMERICAN AND ENGLISH GOLD CHAINS,
GOLD SCARF PINS, LOCKETS, ETC.

Also a fine assortment of Rolled Plate Albert Necklets and Guards of the best quality, and Jewellery of every description.

Canadian Wholesale Agents for American Watch Co., Waltham, Mass.

death-bed, in 1839, an attempt was made to induce him to conciliate the favor of the gods by presenting the stone to the famous shrine of Jahanath, (Juggernant). He is even said to have given his consent by an inclination of the head; but the crown jeweler refused to surrender the treasure without a duly signed, written warrant, which was being prepared when Runjit breathed his last. It thus remained in the Lahore jewel-chamber till the young Rajah Dhulip-Singh was recognized by the British Government, (after the murder of Shu-Singh,) when an English agent was stationed with a strong body-guard in Lahore. Then followed the mutiny of the two Sikh regiments, which brought about the final annexation of the Punjaub in 1849, when as related by Hunt, 'the civil authorities took possession of the Lahore Treasury, under the stipulations previously made that all the property of the state should be confiscated to the East India Company, in part payment of the debt due by the Lahore Government, and of the expenses of the war. It was at the same time stipulated that the Koh-i Noor should be presented to the Queen of England. After the company became possessed of the gem, it was taken in charge by Lord Dalhousie, and sent by him to England in custody of two officers.' Thus this great historical diamond passed with victory from east to west, and was presented to the future Kaiser-i-Hind on June 3, 1850. It was shown at the first great exhibition, held the following year in Hyde Park, on which occasion it attracted a great deal of attention, although it had been so unskilfully treated by the Indian cutter that it looked little better than an ordinary crystal.'

IV.

RECUT BY ORDER OF THE PRINCE CONSORT.

"When brought to Europe the Koh-i-noor was found to weigh exactly 186 1/16 karats. We have seen that Baber gives the weight of Bikermajit's diamond at 'about eight mishkels,' or somewhat over 187 karats, while Tavernier repeatedly declares that the Great Mogul was reduced by Borgio to 279 karats. Again, the two stones were of totally different form, and the Mogul was without a history, having been quite recently discovered in the Kollur mine, whereas authentic records carried the Koh-i-noor back to the year 1304, beyond which date it had a tradition giving it an antiquity of some 50 centuries Several recent writers still, however, persist in regarding these two distinct stones as one and the same gem. Even Prof. Nichol, in the last edition of the 'Encyclopædia Britannica,' revives this theory, and goes the length of suggesting that the Great Mogul, the Koh-i-Noor, and the stone found in Cucha in 1832, were all pieces of one original crystal. Speaking of the Koh-i-Noor, he remarks that 'its lower side is flat, and undoubtedly corresponds to a cleavage plane. Hence it has been conjectured that it and the Russian Orloff diamond are portions of the original stone belonging to the Great Mogul, while a stone of 132 karats obtained by Abbas Mirza at the storming of Cucha, in Khorassan, in 1832, may be a third fragment. This portion was long used by a peasant as a flint for striking fire. The three united would have nearly the form and size given by Tavernier, and the Koh-i-noor would then surpass all known diamonds in its magnitude and in its eventful history.' For a refutation of this theory the reader is referred to our account of the Abbas Mirza diamond.

"In consequence of the clumsy way in which the Hindoo cutter had handled the Koh-i-noor, at a time when the art was still, doubtless, in its infancy, Prince Albert consulted Sir David Brewster as to how it might be recut to the best possible advantage. He found in it, as is the case with many other large diamonds, several little caves, which he declared (according to his theory) to be the result of the expansive force of condensed gases. This, together with the flaws already noticed, he considered would make the cutting of it, without serious diminution, a very difficult thing. Messrs. Coster, however, of Amsterdam, thought that in the hands of skillful workmen, the difficulties might be overcome. Several patterns of cuts were laid before her Majesty and the Prince Consort, and after due consultation, selection was made of the form which it now has, and which may be described as that of a regularly cut brilliant.

"Mr. Voorsanger, of Mr. Coster's establishment, was the workman intrusted with the responsible task of recutting the famous gem, and his labors were conducted in the *atelier* of the crown jewels, in London. To assist his object a small four-horse machine was erected, and the cutting commenced by the Prince Consort placing the diamond on the mill on the 6th of July, 1852. The operation was completed at the end of thirty-eight days of twelve hours each. The Star of the South, a much larger stone, was afterwards cut by the same hand in three months. But the Pitt, or Regent, treated by the slower hand process of the eighteenth century had occupied no less than two years.

"One of the flaws in the Koh-i-noor gave great trouble. In order to remove it the number of revolutions of the cutting wheel had to be increased to 3,000 per minute, and even then the object was only attained very slowly. During the process of reduction the diamond lost exactly 80 karats in weight, having been reduced from 186 1/16 to its present weight of 106 1/16 karats.

"After all, the result was far from giving universal satisfaction, although obtained at a cost of no less than £8,000. The Prince Consort, who took the greatest interest in the operation, and whose sound advice had probably prevented a total failure, openly expressed his dissatisfaction with the work.

"On the treatment which the Koh-i-Noor received in the cutter's hands, King is very severe, remarking that owing to the flattened and oval figure of the stone, the brilliant pattern selected by the Queen's advisers 'entailed the greatest possible amount of waste.' He adds that Mr. Coster would have preferred the drop form, but that, 'in a historical relic like this, the sole course that would have recommended itself to a person of taste, was the judicious one pursued some years before by Messrs. Rundell and Bridge, in their recutting of the Nassak, both in its native and artificial figure. In this by following the trails of the Hindoo cutter, amending his defects and accommodating the pattern to the exigencies of the subject matter, they transformed the rudely faceted, lusterless mass into a diamond of perfect brilliancy, at the sacrifice of no more than ten per cent. of its original weight.'

"It may also be remarked that, although said to be cut as a brilliant, this great Oriental talisman is really only such in name, being much too thin to have satisfied the Jeffries, Ralph Potters, and the other great dealers of the last and beginning of the present century.

Please do *not* associate us with goods made in Hartford, Ct., with which we have no connection. We make all the goods we sell, and have our own especial patterns.

SIMPSON, HALL, MILLER & CO.

In fact, the cutting of the Koh-i-Noor on this occasion revealed the painful fact that the art was then extinct in England, while even the Amsterdam and Paris operators had lost much of their former cunning. They followed a system of mere routine, betraying little inventive power, and showing themselves incapable of grappling with the problem of how best to reduce a stone with the least sacrifice of its weight, and the greatest display of its natural luster.*

"The Koh-i-Noor is preserved in Windsor Castle. A model of the gem is kept in the jewel room of the Tower of London, to satisfy the laudable curiosity of her Majesty's faithful lieges. Although not of the very finest water, and of a grayish tinge, the stone was valued before being recut at about £140,000. But Barbot considers it far from being worth such a sum. He allows, however, that it is still an extraordinary stone, 'but more on account of its great surface than for its play, which is almost neutralized by its great spread.' It must, however, be remembered that this is the criticism of a Frenchman, naturally alarmed for the hitherto unrivalled reputation of the Regent. Since Barbot's time it will be seen in our account of the English Dresden that the luster even of the Regent has been somewhat dimmed by the absolutely faultless character of the Bagagem crystal.

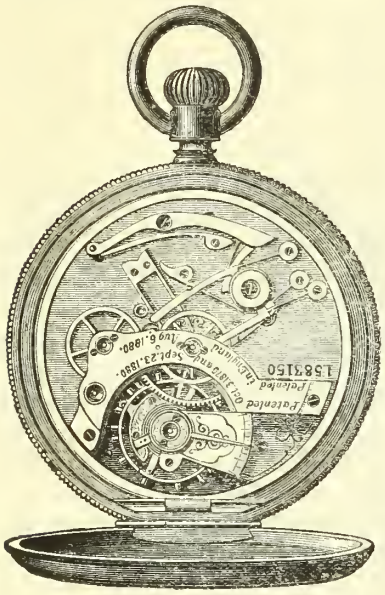
"Although yielding to these and perhaps one or two others in brilliancy, as it does to several in size, the Koh-i-Noor must ever remain without a rival for the intense interest attaching to the sanguinary and romantic incidents associated with its marvelous career. A strange fatality presided over its early vicissitudes, but its alleged 'uncanny' powers have now ceased to be a subject of apprehension. Its latest history eloquently demonstrates the fact that extended empire is a blessing, just in proportion as it finds hearts and hands willing to fulfil the high duties which increased privileges involve."

* The art, however, has within the last few years not only been revived, but now far surpasses anything ever hitherto accomplished.

HALL-MARKING.*

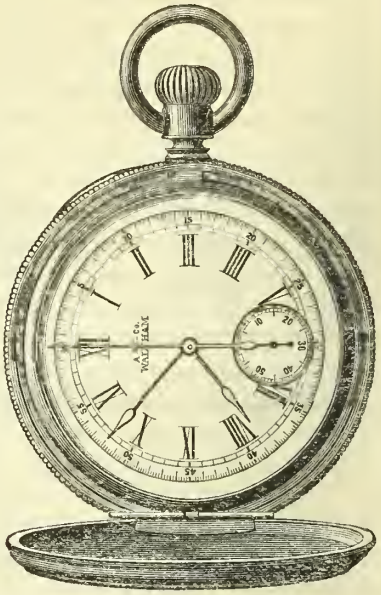
BY G. E. GEE, IN THE WATCHMAKER, JEWELLER AND SILVERSMITH.

The question of compulsory hall-marking will, in all probability, receive additional attention now that the vexed question of the duty has been so prominently brought forward. It has been said that the abondonment of the duty would also do away with the hall-marking system, and that the result would be the flooding of the country with wares unworthy of the name of the precious metals. This opinion is, we think, more theoretical than practical, and manifests a great want of that knowledge of the system which is essential to a proper understanding of it. The removal of the duty need in no way whatever interfere with the hall-marking of gold and silver articles.



Hall-marking has been practised for more than 580 years, and was instituted long before the duty was enacted. It dates as far back as the year 1300, whilst the duty has existed from the year 1719; the latter, therefore, was imposed 419 years subsequent to the system of hall-marking. It also continued during the period between 1758 and 1784, at which time the duty was temporarily removed. The buyers of gold and silver wares need not be under the slightest apprehension as regards the abandonment of the hall-mark, beyond the removal of one of the cabalistic characters from the present set of hall-marks, viz., the Queen's head, which now represents the payment of the duty. This argument, then, like a great many others connected with this subject, is an unwarrantable assumption, and based upon an imperfect knowledge of the facts connected with the English hall-marking system. It is true the duty question is closely interwoven with with hall marking system, as it brings into force the compulsory powers of our laws relating to this matter; but that is the only point where the two can be made a part of the same question.

It is compulsory that all duty-paying articles shall be hall-marked, the one cannot at present be separated from the other, and this is precisely what the trade and its adherents are seeking to reform. We think few people will object to hall-marking pure and simple, but it must be without the payment of duty on wares submitted to that process to be at all satisfactory to our present requirements.



At the present time we have compulsory hall-marking and voluntary hall-marking, and the question is, which of these two the trade and those affected by it will in the future prefer. There is something to be said in favor of both systems when the matter is brought to bear upon special articles. For instance, there is the manufacture of watch cases, which in this country must be hall-marked. Whether this regulaiton is to be continued in the future requires calm consideration and a practical insight into the business; it is not to be decided off-hand. There is this much to be said in its favor, that compulsory powers to mark tend to keep up the standard quality of the cases themselves, whilst it also prevents unscruplous people from putting inferior cases to their work, which can have but one tendency, and that is, a lowering eventually of the quality of the movements in point of workmanship as well as superiority of finish, which things are all in all to a watch in so far as its time-keeping properties are concerned.

Another point of some importance to the English watch-case trade is, that the compulsory hall-marking of them shuts out the home market from American manufactures. Whether this is an advantage or not to the English workman is not yet decided by those engaged in it; but this much is an established fact, that it is impossible for the English manufacturer to take a colonial order for watch cases other than hall-marked ones, on account of the compulsory enactment of our existing law, which will not permit of the work being done in this country without being hall-marked; consequently many orders have been refused, but whether the English artisans have the best of this arrangement is an open question and one that is certain to come to the front for practical discussion, and that, too, in the immediate future; for it is not always that watch cases are ordered to be hall-marked, some buyers prefering them otherwise when the quality can be depended upon, and under such circumstances the English case-makers cannot be competitors for the work in consequence of our system, which necessitates the hall-marking of every case made in England.

The hall-mark on a watch case is a guarantee of the standard quality to a certain degree, but is not an absolute one. There is so much solder run in under the rims of some, and other inferior metal employed in the connecting of them together, that watch cases actually put into the melting pot and melted down do not assay at more than from 3s. 10d. to

THE NEW WALTHAM WATCH CHRONOGRAPH.

The Best Watch now in the Market for General Use.

SOLD IN GOLD CASES ONLY.

Fourteen and Eighteen Carat Fine. Quality Stamped and GUARANTEED by the Company.

This watch is of medium size, and made to indicate and register the fifth second.

By new inventions and the applica ion of American Machinery, THE AMERICAN WATCH Co. has so simplified the manufacture of these Watches as to greatly reduce their cost, and they can now be obtained at prices which make them the MOST DESIRABLE time-piece for all classes of watch wearers.

NEW YORK.

4s. per ounce, being equivalent to from 16dwts. 12grs. to 17dwts. of fine silver per ounce, instead of 18dwts. 12 grs., which is the hall-marking standard. Anyone who has had anything to do with the melting and assaying of old watch cases for re-manufacture can bear out these observations. In the United States they have no hall-mark, but this has not prevented their manufacturers from making their mark after a certain fashion all over the world. But the fact is, manufacturers should care more for their reputation than for the trifling gain to be obtained through the selling of an article of inferior quality, which a slight deviation from the standard might bring to them.

There are comparatively few persons outside the jewellery and watch trades that know the hall marks when they see them. They are so fantastically varied in their character that to most persons they are positively confusing and misleading, especially as many of them are more or less spurious imitations of the genuine marks; these being allowed to be put upon the various manufactures by makers or other interested persons, and in some cases they have been found to be positively fraudulent.

CANADIAN MANUFACTURES.

As Canada progresses and becomes more and more a manufacturing country, and enters into competition with the manufactures of the world, it must become of greater importance that the motive power of our factories be cheaply produced and be so regular and perfect in its action as not to injure the quality of the goods turned out.

Quantity of production is all very well in the way of providing dividends for the shareholders, but if the quality be deteriorated in order to increase the quantity, the dividend-paying powers of the factory will not be long-lived. Excellence and uniformity in quality, combined with honesty in the nomenclature of the goods produced, are the pillars upon which the world-wide reputation of many an old business to-day stands. Whether it be in the manufacture of cottons or woollens, the production of pig iron or boiler plate, or the construction of a reaping machine, or the building of a steam engine, the same principle will be found to apply.

The interest of the general public must be *served*. The public may be easily gulled and deceived for a time, but it is only for a time. While it takes years of patient and presevering, honest labor to establish a good reputation, the reverse can be rapidily and easily obtained. Our manufacturers should never lose sight of this view of the subject. Their business, from the amount of capital invested in buildings, machinery and plant is intended to be a durable and lasting business. While looking to government legislation to help them and protect them in their efforts to establish their industries, they should never forget that, to deserve help and protection, they should produce goods as excellent in quality and as serviceable to the public as any that could be imported. If they do not do this, how can they ever expect to extend their business to other countries? If the quality and price be as satisfactory, what difference should it make to the West Indian, or the native of Brazil, whether the goods he buys be manufactured on the north or south side of the line dividing Canada from the United States?

The manufacturers of Canada must be able to satisfy the reasonable demands of the Canadian public ere they can hope to establish a foreign reputation. It is a short-sighted policy, and one which won't pay in the long run, to send off to some distant place goods which cannot be sold at home because of their inferior quality. Upon what does the quality of the goods depend? This is a question which every manufacturing firm, whether a private enterprise, or a joint-stock concern, should carefully consider and find the correct answer to. To aid them in doing so we offer a few suggestions.

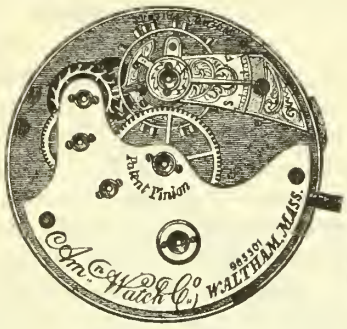
In the first place, the factory should be managed by one head, who has a thorough knowledge of the goods to be produced and a definite standard of excellence constantly before him. In the second place, the machinery employed should be adapted for the work. It will pay to "get the best," though often there is difficulty in deciding which is the best. In some English factories no machine is kept in use or allowed floor space which has got to be behind the age, or so far out of repair as to necessitate a mechanic being kept after regular hours to adjust it. No machine allowed to run down, its fittings half gone, its bearings worn out, and its journals running loose and out of truth, can produce good work. Another requisite is to have the right kind of work-people well treated, contented in their situations, interested in their work and in the general success of the business. Still another is the constant supervision as to the quality of the raw material brought into the factory, and over every stage and process in its manufacture, combined with a continual aiming at improvements, and keeping ahead; not merely supplying the demands of the purchasing public but creating demand by placing on the markets new designs and improved qualities.—*Canadian Manufacturer.*

BUSINESS CHANGES FOR OCTOBER.

Adam Hope, hardware, Hamilton, Ont., suspended; James Farrow, hardware & tins, Innerkip, removed to Ayr; James Foster & Sons, hardware, Toronto. assigned; Simon Armstrong, hardware, Moorefield, Ont., sold out; L. A. Lesperance, jeweler, Montreal, assigned; J. D. Northgraves, jeweler, Rat Portage, Man., giving up business; Fowler & Vick, jewelers, Winnipeg, Man., dissolves, W. A. Fowler retires; W. H. Roberts, jeweler, Stratford, Ont., sold out to P. Woods.

BUSINESS NOTES.

J. R. Cole, a Montreal Jeweler, has assigned in trust. He owes about $2,000, and has assets to about the same figure.



The town council of Brockville has agreed to furnish Messrs. McDougall, Logie & Co., of Montreal, a site for a paint mill and exemption from taxation for a period of ten years, providing they give employment to fifty hands, and erect a building 100 by 35 feet to start with.

E. A. Lesperance, a Montreal jeweler, of recent establishment, has assigned in trust to his father; this step being precipitated by a seizure before judgment on the part of a creditor. Liabilities are stated at $2,800, with assets of about $1,600. The business will likely be wound up.

Kind Words—Our clever contemporary, the *Merchant & Manufacturer*, of Toronto, gets off the following concerning The Trader:—"*The Trader* is a monthly journal, published at Toronto, and is devoted exclusively to the jewelry trade. It gives good hints to the trade worth remembering and presents a very neat appearance." We say "Amen," with thanks.

A meeting of the creditors of the estate of James Foster & Sons, hardware merchants in this city, was held last week. The statement then submitted showed that the direct liabilities amounted to $31,000 with $18,325 of assets. One of the firm made an offer of 30 per cent., but this was declined. At the same time it was intimated that an offer of 40 cents on the dollar, secured, would be favorably considered, provided that Richard M., one of the brothers, retired from the firm. This, we understand, he is anxious to do.

Among all the residents of Brantford, probably none is better known to the business com

munity of Canada than Mr. Ignatius Cockshutt, who has been a merchant for fifty years in that place, and has seen it grow, and helped its growth, from a village into a prosperous town and a busy city. That now venerable gentleman has retired from active business, and his retirement was made the occasion of the presentation to him last week of an address and a silver casket by his fellow-citizens. There are many outside of Brantford who will join us in adding our congratulations upon his long and prosperous business career, and our hopes that he may long enjoy his well earned leisure.

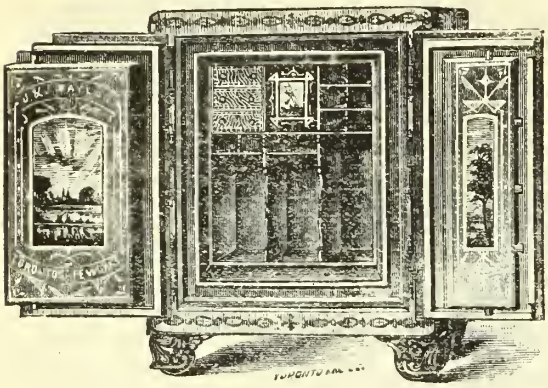
The premises of Messrs. Zimmerman, McNaught & Lowe, were badly damaged by water from one of the upper flats, on Sunday, 22nd inst. The loss being valued by the firm as high as $500. It appears that the top flat of the building is leased to a tenant, who carelessly left the tap open, and allowed the water to flood the building from top to bottom. The principal sufferers are the firm above mentioned, who claim damages from the landlord, on the ground that the accident was due to neglect on the landlord's part, in supplying this tenant with a water tap, without making any provision whatever for the waste water. The firm have again got straightened up, and are now ready to serve their customers as usual. They have just completed fitting up their premises with steam pipes and radiators, and have now one of the neatest and best equipped jewelry warehouses in Canada.

The way of the transgressor is hard," and fully justifies the truth of the old saying, that a rogue is sure to come to grief as last. This has been well exemplified in the case of Aljo, the jeweler, whom our readers well recollect we had occasion to dish up, over a year ago, for his swindling operations in Hamilton, Ont. After leaving Canada, it appears he took refnge in Chicago, and from thence drifted no one knew whither. The following paragraph from the *Watchmaker & Metalworker*, of Chicago, Ill. will give some clue to his subsequent career. "W. Aljo, a silversmith employed in H. J. Young's jewelry store, Joliet, Ill., was arrested last month for stealing jewelry, etc., from his employer. Young has missed different articles from the store for the last two months, and has been on the watch. Young thinks from $500 to $600 has been taken. Aljo was bound over in the sum of $150, and, not able to secure bail, was consigned to the jail. He is a Canadian, and has been here four months. He formerly worked in a pawnbroker's shop in Chicago." We don't know whether Aljo is a Canadian by birth or not, if so, his native country is well rid of him, and we trust that our friends across the line will keep him in durance vile, until he can keep his hands out of other peoples' pockets. "He that being often reproved and hardeneth his heart, shall suddenly be cut off, and that without remedy."

A meeting of the creditors of Messrs. A. & C. J. Hope & Co., was held in Montreal last Friday, and was largely attended, but little business was transacted beyond appointing a board of trustees composed of Messrs. Winn, Reford, Cotten, Simpson and Wilson, with Mr. P. S. Ross as accountant, to investigate matters and report at a further meeting. The statement submitted showed gross liabilities of $423,714, but after deducting bills under discount considered good, &c., the net liabilities are figured at $175,458, with net assets of $85,883. No offer was submitted, though the Messrs. Hope were understood to say that they did not consider the estate worth more than forty cents; $35,000 of the liabilities are due to seven Canadian houses. In consequence of this failure, the suspension of the old firm of Adam Hope & Co., Hamilton, hardware importers, is announced. The house was founded some twenty-five years ago. The business was then located in London, Ont., and the Messrs. Hope were partners in the firm. After this the business was removed to Hamilton, and the firm was successively connected with Buchanan, Harris, & Co., and Buchanan, Leckie & Co. The senior member of the firm died only a few months ago. A meeting of creditors has been called for the 14th prox. It appears that the creditors of A. & C. J. Hope, of Montreal, have refused to complete a settlement with that firm upon the basis of their own assets, but demand, in addition, an inquiry into the affairs of the Hamilton firm of Adam Hope & Co., one of the partners being also a partner in the Montreal house.

One of the most valuable inventions of the day for preventing danger to life and limb from machinery may be seen in operation at the Dominion Bolt Works, Toronto. In the engine room is a weight suspended by a wire rope, which latter is coiled around the throttle valve of the engine. As long as all is right, however, the weight does not *pull* upon the rope, a rest that just holds it being provided. The whole is so placed that the passing of the electric current along a wire releases the rest, when instantly the weight falls, pulls upon the wire rope, which in its turn pulls upon the throttle valve and cuts off the steam, thus stopping the machinery. In different parts of the works are placed buttons, with wire connections. On pressing any of these buttons the electric current takes its instantaneous spring, the weight falls, the wire rope pulls on the throttle valve, and the steam is cut off in less time than the engineer would require for walking across the room to do it. Of course in any factory the electric buttons could be placed in every room, or several of them in a large room, or wherever necessary. Whenever anyone happens to get caught by the machinery, the simple pressing of a button, in the most distant part of the factory, will stop the whole as quickly as could be done were the engineer standing ready to jump at a signal given. We should say that no factory should be without it. This really valuable invention is to be patented by Messrs. Nesbett Bros., electricians, Toronto.

WORKSHOP NOTES.



Making Pivot Files.—Dress up a piece of wood file fashion, about an inch broad, and glue a piece of fine emery paper upon it. Shape your file then, as you wish it, of the best cast steel, and before tempering, pass your emery piece several times heavily across it, diagonally. Temper by heating to a cherry red and plunging it into linseed oil. Old worn pivot files may be dressed over and made new by this process. At first thought, one would be led to regard them too slightly cut to work well, but not so. They dress a pivot more rapidly than any other file.

To Make a Diamond Mill.—Make a brass chuck or wheel, suitable for use on a foot lathe, with a flat, even surface or face about 1½ or 2 inches in diameter; than place a unmber of the coarsest pieces of your diamond dust on different parts of its face, and with smooth-faced steel hammer drive the pieces of dust all evenly into the brass to nearly or quite level with the surface. Your mill, thus prepared, is now used for making pallet jewels, or for grinding stone and glass of any kind. For polishing, use a bone or boxwood chuck or wheel, of similar form to your mill, and coat it lightly with the finest grade of your diamond dust and oil; with this, a beautiful polish may be given to the hardest stone.

Diamond Broaches.—Make your broaches of brass the size and shape you desire; then, having oiled them slightly, roll their points into fine diamond dust till entirely covered. Hold them then on the face of your anvil, and tap with a light hammer till the grains disappear from the brass. Great caution will be necessary in this operation. Do not tap heavy enough to flatten the broach. Very light blows are all that will be required; the grains will be driven in much sooner than one would imagine. Some roll the broach between two small pieces of steel to imbed the diamond dust. It is a very good way, but rather more wasteful of the dust. Broaches made in this way are made for dressing out jewels.

Drawing Temper.—The following method is said to be excellent for drawing the temper from delicate steel pieces without springing them: Place the articles from which you desire to draw the temper into a common iron clock key. Fill around it with brass or iron fillings, and then plug up the hole with a steel, iron or brass plug made to fit closely. Take the handle of the key with your pliers, and hold its pipe into the blaze of a lamp till nearly hot, then let it cool gradually. When sufficiently cold to handle, remove the plug, and you will find the article with its temper fully drawn, but in all other respects as it was before. You will understand the reason for having the article thus plugged up, while passing it through the heating and cooling process, when you know that springing always results from the action of changeable currents of atmosphere. The temper may be drawn from cylinders, staffs, pinions, or any other delicate pieces by this mode, with perfect safety.

Other Methods for Tempering Springs.—Having fitted the case according to your liking, temper it hard by heating and plunging into water. Next polish the small end so that you may be able to see when the color changes. Lay it on a piece of copper or brass plate, and hold it over your lamp, with the blaze directly under the largest part of your spring. Watch the polished part of the steel closely, and when you see it turn blue, remove the plate from the lamp, letting all cool gradually together. When cold enough to handle, polish the end of the spring again, place it on the plate, and hold it over the lamp as before. The third bluing of the polished end will

leave the spring in proper temper. Any steel article to which you desire to give a spring temper may be treated in the same way. Another process, said to be good, is to temper the spring as in the first instance, then put it into a small iron ladle, cover it with linseed oil, and hold over a lamp till the oil takes fire. Remove the ladle, but let the oil continue to burn until nearly all consumed, then blow out, re-cover with oil, and hold over the lamp as before. The third burning out of the oil will leave the spring in the right temper.

SCIENCE NOTES.

A ROYAL commission has been examining into the guilds of London to see if they are making proper use of their enormous funds. The guilds admit the possession of property yielding $3,750,000 per annum. The sum spent by the companies in dinners is said to amount to nearly $365,000 per anuum, the Goldsmiths' Company alone being reported to have spent $300,000 in that way within ten years.

A DECISION has been rendered by Judge Lowell in one of the United States Courts to the effect that coins with holes in them are in no wise fraudulent so long as they are full weight. Even pluggiug them with base metal does not impair their value provided no silver is lost. Coins with holes in them are nevertheless open to the suspicion that the silver has been puuched out. As it is inconvenient to weigh them, their withdrawal from circulatiou would be a good thing.

HE was a very nice and a very fresh young man, making his first trip for a Provideuce cheap jewelry house. He was on a steamboat going from St. Louis to New Orleans, and was decidedly under the influence of bad whiskey. He persisted in singing at the top of his voice, and it was the poorest kind of singing. After a brief pause he removed his hat and said: "Now I'm going to sing something sad." "Hadn't you as soon wait until we get to Vicksburg?" inquired a passeuger. "Wh—what f'r?" gasped the young mau. "Because, I've got a young mule on the lower deck, and if he gets an idea that he can sing as good as you, he'll never be worth a nickel to bray." There was no more singing.

A NEW YORK exchange relates the following incident which is said to have recently occurred iu a town not 100 miles from that city. An old farmer had just returued from town, and for the first time in his life possesses a watch, which he "bought in the Bowery, and the man sed it was a stunuer for time-keeping." Turning to his son, he says, "Come here, Jed, and see the inside of the thing. There, that thing," pointing to the regulator, "the man sed, made it go just as yer wauted it ter, but what do yer s'pose that F and S means on that piece that's marked off? Hauged if I cau make it out." "Let's see, dad," says Jed, "I'll bet I know; it's ter regerlate the thing, and tells yer when ter do it. F is for forenoon and S is for 'sarftnoon." The old farmer gazed at his son with admiration, and says, "There ma, didn't I allus tell you Jed was a born watchmaker?"

IN proportion to the number of inhabitants there are more diamonds bought and worn in Denver than in the east or in San Francisco. The people who buy diamonds do not do so from hoarding up scanty earnings. If they are not able to buy them easily they do without. Then again, very little shoddy jewelry is worn. People do not ape what they cannot afford; and when they can afford they must have only the best quality—solid gold and the purest gems. It is not an uncommon thing to see a lady in silk purchasing jewelry at one couuter, while at another is the cowboy in buckskin buying a diamond pin or a gold watch, or the lucky miner in California "duck" selecting a set of jewels for his temporary inamorata. Seme of the jewelry stores in Denver carry very large stocks of the finest goods made iu the market.

A CURIOUS set of silver, which once belouged to Charles Fletcher, the actor, is displayed for sale in the window of a Bowery jewel-r. It was bought by the present owner in a Philadelphia pawushop, where it had been left by an actress. The set consists of 135 pieces of solid silver, and originally cost $1,000. There are three dozen knives, iucluding dinner aud tea knives, fish knife, game knife and pie kuives; gravy ladles and soup ladles; three dozen forks, a dozen table spoous, a dozeu desert spoons, mustard spoon, sugar spoous, salt spoons, tea strainer and sugar spriukler. The set was made in Paris, and is contained in a handsome case. From the same pawnbroker two of Fechter's watches were bought, and a silver mug which was presented to Fletcher iu Boston. The latter was bought by William Warren, the actor, and first presented to Joseph Jefferson, the actor.

A DIAL-OGUE.

"Mr. S——will you please tell me what *time* it is?"

"I'll hand you my watch and you can see for yourself."

"The *movement* might be too much of an exertion for you."

"You might as well tell me that I am *too slow* for any use."

"Well I think you are rather a hard *case*."

"You are always *hunting* for some way to annoy me."

"You can't *point* out a single time."

"Well, you had better *stem* the tide of your abuse."

"You will never *wind* me up in that way."

"I never expect you to *stop* when you can say anything mean."

"Yes, I have the *face* to say most anything."

"I wonder what you will *spring* on me next."

"If you wait a *second* you'll see."

"Your *main* object in life seems to be to make people uncomfortable."

"You think you have found the *key*-note to my character."

"I have a whole *chain* of evidence to prove it."

"Still my society seems to have a *charm* for you."

"O, yes; I think you're a *jewel*."

"The fact is *patent* to all."

"Maybe you are the *lever* that moves the world."

"No, but I am the *pivot* on which it turns."

"One would never think you could *regulate* the universe."

"Well, its clear as *crystal* that I am only wasting precious *hours* chinning you. Ta, ta."

Editorial.

THE COMPLIMENTS OF THE SEASON.

The present is the season of congratulations and good wishes, and for the fourth time we have pleasure in availing ourselves of the opportunity of saying a few kind words to each of our readers. Looking back on the year that has just passed away, we think most of our friends will agree with us that, as a people, Canadians have very much to be thankful for. Our country has enjoyed the blessings of peace and prosperity within its borders, our fields have furnished an abundant harvest to the husbandmen, prices for most kinds of produce are high enough to amply repay the grower for his toil; our manufacturing industries have greatly increased in number and in the quality and variety of their productions. Our great North-Western country has developed with an almost amazing rapidity, and the Trans-Continental railroad, which is to unite our scattered Provinces into one solid confederation, has been pushed ahead with a speed that has outstripped the anticipations of even the most sanguine.

In a word, our affairs are in a highly prosperous condition, and though there is and must always be exceptional cases, the great mass of our people are much better off than they were at this time last year. Of course all of us have had our trials and troubles, and no doubt many of us thought that perhaps we had more than our share; but, in spite of all that is past, we think most of us will look back to the year 1882 as one of the best and brightest in our lives. Life is not all saccharine matter, as some would have us believe, neither on the contrary is it all vinegar; but we think most of us will agree that the sweets are more plentiful than the bitter, and the memory of our many joys dwells with us longer than the recollection of our sorrows. It is well that this is so, for it would be ill for us if the paralyzing influences of sorrow failed to be chased away by the soothing influences of our more cheerful surroundings.

This being the case we think that most of our readers as they look back on the year that has just passed, will, taking it all together, regard it as a good year and a bright one. May the new year on which we are about to enter prove equally fruitful to us of prosperity and happiness. And now in this season of mirth and good-fellowship, although we cannot shake them all by the hand, we desire to wish our readers one and all a Happy New Year, and to say like little Tiny Tim, "God bless us every one."

TORONTO AS A TRADE CENTRE.

We have frequently felt called upon to draw the attention of our readers to the wonderful growth of Toronto as a commercial city, and have pointed out the fact that its geographical position and unrivalled facilities for communication with the richest provinces of Canada, are bound to make it in the near future one of the most important trade centres on this continent. Containing as it does with its suburbs, a population of nearly one hundred thousand inhabitants, its purely local trade is in itself no small item, but when to this is added the large and ever growing wholesale trade that this city now possesses, it will easily be seen that its residents may safely congratulate themselves on being "citizens of no mean city." It is now an almost admitted fact that Toronto now controls the wholesale trade of Ontario, at present the richest province of our great Dominion. In addition to this she is making a strong bid for a goodly share of the immense trade that must shortly spring up in the fertile prairie lands of our wonderful Western Provinces. As these fertile belts consist mostly of agricultural lands, and must of necessity be peopled mainly by immigration, it can be easily seen that for many years to come it will be almost an impossibility for manufacturing centres to spring up in a country where wages and living of all kinds are as high as they must necessarily be there. This being the case, these western agricultural provinces will have to look to the populous Eastern Provinces for the manufactured goods that they will for many years be compelled to buy with the product of their farms. This trade, which must shortly grow to gigantic proportions, will have three strong competitors: Montreal, Toronto and Winnipeg, three cities that are bound ere another decade to rank among the commercial centres of the world. In this race for commercial supremacy, Montreal has a slight advantage from its proximity to the seaboard, but against this, Toronto has the command of the trade of the magnificent Province of which it is the capital, and its advantage in distance to the prairie provinces. Winnipeg, although having many drawbacks, has one great advantage, it is like the man in possession, on the field and always ready to do the business. So far as present appearances go then the chances of those three cities for the possession of this market seem almost equal, and we very much doubt if any one of them will ever get much more than its legitimate share of the immense trade that must very soon spring up in that wonderful western country.

Any one looking at the Toronto of to-day and the Toronto of twenty, or even ten years ago, can hardly fail to be struck by the great strides it has been making. Its buildings are larger, costlier and of greater architectural beauty, its streets are better drained, better paved and better lighted, its public buildings are worthy of the province they represent, and its private residences vie with those of any city on this continent, and worthy of the city "whose merchants are princes and whose traffickers are the honourable men of the earth."

As a manufacturing centre, Toronto, although at present probably the second city in the Dominion, bids fair ere long to lead the van in this department of Canadian enterprize. In every quarter of the city, tall chimneys may be seen belching forth the smoke and smut, that

although disagreeable to residents, is a sure indication that within those mammoth factories are toiling thousands whose labours are ever tending to enrich the city. We think we are safe in saying that Toronto is progressing more rapidly as a manufacturing than even as a commercial centre, and it is the side by side growth of these two interests that we think must ultimately place it in the van of all Canadian cities.

The Globe, a few days ago, in the course of a very interesting article upon the commercial growth of Toronto, has the following table shewing in concise form the estimated total volume of trade or amount of sales in the various branches for the year, 1882. The figures will be found approximately correct :—

Dry Goods	$12,000,000
Groceries	8,000,000
Hardware	3,600,000
Boots and Shoes	2,000,000
Leather	2,000,000
Millinery	2,000,000
Hats, Caps and Furs	1,000,000
Clothing	1,200,000
Fancy Goods & Fey Dry Gds.	2,000,000
Jewelry	1,000,000
Stationery	2,100,000
Paints, Drugs and Oils	2,300,000
Crockery and Glassware	800,000
Total trade for 1882,	$40,000,000

It will be seen by the above figures that the wholesale trade of Toronto at first hands, irrespective of produce, will for the present year, 1882, total $40,000,000, as compared with $35,600,000 in 1881, and $31,000,000 in 1880, or an increase in two years of $9,000,000. The 150 houses give employment to about 4,000 persons.

The value of the imports for the first three-quarters of the calendar year amounts to $15,132,426. A low estimate will place that for the current quarter at $3,600,000, making a total import value for 1882 of $18,732,426, as compared with $13,500,461 for 1880, and $17,565,890 for 1881. The value of imports in 1876 was $12,637,239."

"WE CAN'T CHECK MANITOBA."

"That the road shall be allowed full play from twenty years from now, and only ten years after construction, and that it should be protected from the chance of being robbed of all the profits, robbed of all the gain, the legitimate gain which the company expects to get from this enterprise, and the employment of their capital. This was done only to protect them for the first ten years of their infant traffic. We know perfectly well it will take many years before that country is filled up with a large population, and the first ten years will be most unprofitable ; we know perfectly well that it will require all the exertion, all the skill, and all the management of the Company to make the eastern and western sections of this road fully compensate them, and fairly compensate them for their responsibility and for their expenditure during these two years. In order to give them a chance we have provided that the Dominion Parliament—*mind you, the Dominion Parliament ; we cannot check Ontario ; we cannot check Manitoba*—shall for the first ten years after the construction of the road give their own road, into which they are putting so much money and so much land, a fair chance of existence." *Extract from Sir John Macdonald's speech in Parliament on the Pacific Railway Charter.*

The Local election in Manitoba which comes on now in a few days, is being fought out entirely on the question, "shall we have railroad competition, or shall we be left to the tender mercies of the Canada Pacific Railway for the next twenty years as proposed by that corporation." This issue, as every one knows, has been brought about by the disallowance by the Dominion Government of the charter of the Manitoba & South-eastern Railway charter, lately passed by the Local legislation of Manitoba. This road, which, as every one knows, was intended as an opponent to the Canada Pacific, by enabling the Grand Trunk and American railroads to gain admittance into Manitoba and the North-west Territory, would have been a great boom to the people of those western Provinces, because, as soon as it was completed, the exorbitant rates charged by the St. Paul & Manitoba, and the Canada Pacific Railway, which are really owned and run by the same company, would have to be lowered to something like reasonable rates.

This monopoly, the Pacific Railway Company of course will seek to preserve at all hazards, and it seems that in spite of the explicit declaration of Sir John Macdonald, as quoted above, that the Dominion Government is bound to stand by their railway friends and see them through. Whether this be a wise policy, or whether they cannot help themselves it is hard to say, but the result as far as Canada is concerned is not hard to determine. It is only a matter of time when public sentiment on this question of railway competition for the North-west will force the government to concede to the people of Manitoba, what they ask and grant them the inalienable right that every people have of self government. As a matter of fact, this disallowance of the Manitoba & South-western Railway is a matter that the Dominion Government has no connection with whatever, and belongs purely to the Province passing it. It is therefore a question for the people of Manitoba to decide, shall we have the right, the same self-government as is accorded the people of the other Provinces, or shall we suffer the Dominion Government to trample upon our rights as they seem inclined to do?

We shall be more than suprised if the verdict is not against monopoly, and in favor of free railway communication with the rest of Canada. If this is the case the fight will then be transferred from Manitoba to Ottawa, and we shall have the Federal Government at loggerheads with both Manitoba and Ontario. The question of Dominion interference with Provincial rights is getting to be a very important one, and it seems not improbable that if it is not exercised very discreetly and sparingly that we shall have trouble before our people will submit to it.

So far as Manitoba is concerned, we think that that Province is in common fair play entitled to railway competition, just as much as is Ontario or Quebec, and we all know that if the Intercolonial were handed over to a company and Canadian traffic over American railways to the seaboard interdicted, a rebellion would very soon follow.

Whatever be the result, we trust it will be brought about in a peaceable manner, and that by convincing the eastern Provinces that they are in all justice entitled to this demand, they may secure this much desired and needed competition. If they fail in their attempt, they will be entitled to the sympathy of the rest of the Dominion. While the speedy construction of the Canada Pacific Railway is a great national necessity if we are to have prolonged prosperity, the shutting off from it of all honest competition, while enriching its owners at the public expense, will act as a clog on

colonization and all kinds of merchantile pursuits.

We are of the opinion, that in the original contract with the Canada Pacific this monopoly clause was never intended to apply to Manitoba, and that when the Dominion Government find that the people of that Province won't stand it, they will find some plausable way of getting around it, and giving the company something else in its place. In our opinion, the sooner this takes place the better for Canada, and our prospects in the North-west. "We can't check Manitoba," neither should we try.

Selected Matter.

A SIMPLE BAROMETER.

A correspondent of *The English Mechanic* thus describes a simple barometer: Take a glass tube about 7 in. long, and about $\frac{2}{3}$ in. internal diameter, and draw out one end before the blowpipe to a point, leaving a very small orifice, about $\frac{1}{100}$ to $\frac{1}{60}$ of an inch diameter. This end of the tube should not be quite sharp, but somewhat rounded. A cork is prepared to fit tightly the wide end of the tube, and if the cork is made of cork, its sides and upper ends should be greased or coated with parafine, the lower end being left uncoated. A rubber cork would answer better. The tube should now be about half filled with distilled water, although the exact height is of no consequence, and the cork firmly inserted. The tube should be suspended with the point downward near the window, and it should never be shaken. When the barometric pressure is low, indicating rain, a drop of water will appear at the orifice, and hang to the lower end of the tube. When the barometric pressure rises, the drop will disappear, and a bubble of air may sometimes be seen in the act of entering by the narrow opening. If more than one drop is extruded, of course they will fall, but one drop will always remain suspended.

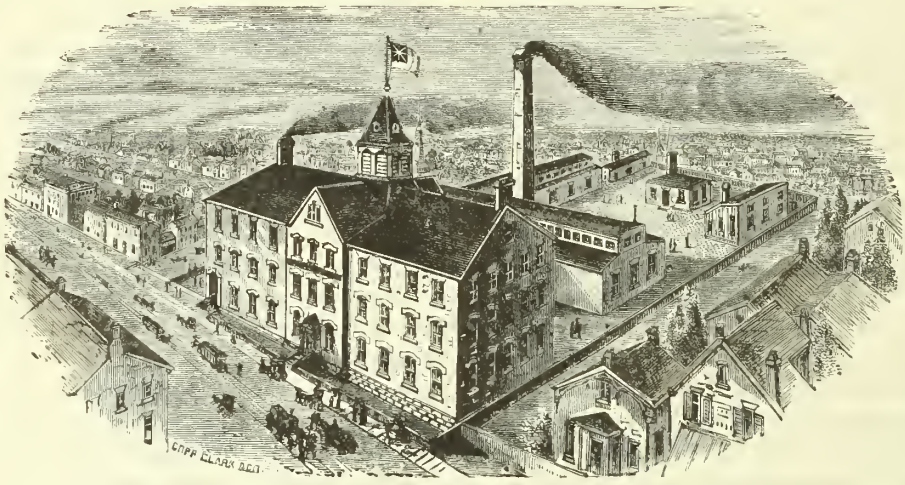
I have had a tube of this description hanging in my laboratory, says the writer, for two years, and I find its indications for rain and dry weather most unerring. The only error arises from extremely sudden rise of temperature, which will sometimes force a drop of water out by expansion, although the barometric pressure is high; but in that case the drop soon dries up; in the other case it hangs persistently, and will in many instances indicate the approach of rain thirty hours before the appearance of the storm. Before rain the drop does not dry up, because then the atmosphere is saturated with moisture. The sensitiveness of this weather-glass depends upon the difference of tension between the surrounding atmosphere, and the air within the tube, the latter expanding or contracting according as the barometric pressure is low or high.

ATTRACTIVE STORES AND KEEPING TRADE.

The first requisite, though by no means the only one to render a store attractive, is to have a good supply of daylight. It is impossible to show goods to an advantage in a dark, dingy place, even were it possible at all times to ascertain if the proper measure of weight is given, or the labels on shelf goods properly deciphered. Nothing will go further, apart from polite and ready attention, to draw new customers, or keep old ones, than a well-lighted, orderly kept store. It is not absolutely necessary that the front windows should contain simply one or two large panes of glass, but they should certainly be as large as possible, irrespective of the number of panes, so as not only to give good and sufficient light, but that articles may be displayed in them to good account. The store fixtures need not be of an expensive nature, but should be of a suitable kind; and the shelves ought to conform in size to the class of goods they are meant to hold. The door, the outside of the counter, and the edges of the shelves should be painted in a uniform, bright, but not gaudy, color.

Windows ought to be kept thoroughly clean at all times, tastily dressed, and the articles displayed therein changed at least once a week, if not oftener, if convenience will allow. If the front of the store is made use of to show certain classes of goods, nothing but the very best should be permitted to appear, and great care should be taken in their arrangement, as many people naturally look upon this as an index to the interior. Every kind of goods should have a special place allotted to keep them, so that they can always be found there when wanted. When serving customers with goods do not, on any account, allow the remainder of those shown if any, to crowd the counter, but return them immediately thereafter to the drawers or shelves from which they were taken. This practice, if strictly adhered to, will not only prevent confusion, but the occurrence of any unpleasant circumstance. In the evenings the windows and inside of the store should be illuminated as bright as possible. To do otherwise, for sake of economy, is, to say at least parsimonious, and it would be far less damaging to the business to close the store door at an early hour than to keep it open, but dimly lighted.

Stock should never be allowed to run low, especially in staple goods: for, should you happen to run out of a particular kind, the chances are ten to one that that article will be the very one most often and first called for. This may probably result in some good customers finding their way to your neighbor's store, where, if they get their wants supplied on the first visit, they may forget to find their way back.—New York *Review*.



BANKRUPTCY LAWS.

Few subjects have been found so difficult of legislative settlement as that of the administration of insolvent estates. This has been the experience not only of England, United States and Canada, but of all civilized countries. What has increased this difficulty has been that nearly all the laws enacted on the subject have had a double object. They aimed at the equitable distribution of the debtor's assets, and at the same time made provision in one form or other for his discharge from his liabilities. There is evidently no absolutely necessary connection between these two matters, and it is believed that a very great deal of the difficulty experienced in the practical working of such laws is due to their being coupled together.

In the United States the General Bankruptcy law was repealed some years ago, and since that time there has been no law for the discharge of bankrupt traders from their debts. As to the administration of their estates each State has been left to enact its own law. The result is the greatest diversity in the rules of law existing in the different States. The evils of this condition of things have long been a

ground of complaint on the part of the mercantile community. Especially with reference to the debts constituting preferential claims in the the different States, have complaints been frequent and loud.

Several times since the repeal of the general law, attempts have been made to have a new one enacted, but so far without success. During the present session the attempt has been renewed, no less than three bills having been introduced upon the subject. Whether they will result in a new law remains to be seen. Certain it is that before long the demand for a general enactment securing uniformity of administration throughout the whole Union will have to be met.

In Canada we have for two or three years been without any general bankrupt law, and in this Province, without any law whatever for the distribution of the estates of insolvent debtors whether traders or otherwise. Mr. Beaty, the member for West Toronto, has brought a bill into the House of Commons to provide for the distribution of insolvent estates. He does not, however, propose to grant the insolvent a discharge. There was some opposition to the first reading of the bill, but its introduction was finally allowed. The present state of the Canadian law is very discreditable, and some such measure as Mr. Beaty proposes is necessary to put an end to the existing confusion. It is doubtful, however, whether the bill will pass this Session.

Under the present state of things there is no provision for ratable distribution of assets in this Province, except in the single case of absconding debtors. The law, so far as they are concerned, is in so imperfect a state that it is seldom indeed that anything at all is realized for creditors after payment of expenses. The late Insolvent Act was no doubt open to some objections on the score of expense, but it was cheapness itself compared to the present process for the liquidation of such estates. This is well exemplified in an estate now being wound up by the Sheriff of York County. In the case in point some fifteen attachments have been issued, and, according to the requirements of the law, each of these fifteen creditors has taken all the necessary steps in a suit down to judgment, and the courts have taxed some six hundred dollars, or about one-half the total amount realized by the sale of the assets by the sheriff, as solicitors' fees in recovering such judgments. In other words, it costs that sum to prove fifteen claims about the correctness of which there is no dispute. Under the Insolvent act it would have cost only one dollar for each claim or one-fortieth of the present expense. In addition to this, sheriff's and bailiffs' charges have to be paid. The fraction which the unfortunate creditors will receive will be infinitesimal indeed.—"*Monetary Times.*"

CELEBRATED HOROLOGISTS.

ADOLPH LANGE, OF GLASSHUTTE.

Incited by the flourishing of the organization of the watch industry among a mountain population like that of the Jura, Switzerland, and the Black Forest, whose inhabitants had formerly lived in woe and misery, and by their new vocation were raising themselves to a comparative state of prosperity, the governments of Prussia and Saxony contemplated making a similar trial with the poor population of the mountainous districts of Silesia and the Laustitz. These districts were exclusively inhabited by the poorest weavers, among whom the well-named "weaver's misery" was at home, and appeared to be indestructible; sometimes, as in the years of forty, their need and misery became so great that they cried aloud for succor, that they implored heaven-born charity of kindly-disposed fellow men in more blessed situations in life, for mercy and alleviation of their over-great misery.

At that time, in 1845, a man submitted a definite plan to the Saxonian government, specifying in what manner the foundation of such a watch industry for the suppression of woe and starvation in the "Erz Gebirge," might be conducted to a successful issue. As stated, the idea had been favorably entertained before by the Governments, but the right man was wanting for the undertaking. He must not alone be a good watchmaker, but also he endowed with the talent of teacher and organizer; he must understand how to deal with a people like that of these districts, which, by prolonged misery and woe, had become distrustful, bodily enfeebled, mentally withered, and dull of apprehension; he must understand how to infuse new hopes, confidence and activity.

Such a man had apparently offered himself, and everything promised that he would discharge these onerous functions. His name was Adolph Lange, born in Dresden in 1815, the son of a gunsmith. His childhood had been unhappy, owing to the unfriendly relations of his paternal home; poverty had limited the field of his education, and when he entered his instructor's shop, only then the talents with which nature had gifted him, began to develop. The boy quickly collected his capacities; he saw a destiny before himself, and retained it in his eye. Applied mechanics contains a subtle, occult spirit that causes many a man to devote himself to its study, in order to lure him into phantasmagorial longing, to waste himself in infruitious nothings. Not so with Lange; he was practical; his nature demanded definite metes and bounds—it required the practical fruits of mental exertions. He suppressed the proclivities of visionary phantasy, and steeled his inclinations while learning—not alone his occupation of watchmaker, but also those sciences by the aid of which he might befit himself for higher performances.

He went to Paris, after serving his time. It is unnecessary to follow him step by step, since it is less our purpose to write an everyday biography, than to show what a man *can* do. After acquiring all the branches of higher horology—chronometry, astronomical clocks, etc.—he returned to Dresden, and married his former instructor's daughter. He soon became famed as one of the first watchmakers of the day, and obtained orders far and near.

Such was the man who had proposed himself to the Governments for the undertaking. Most honourably had he shown his capacity, and his character, his life, his energy, offered safe guarantees that he would be the man for conducting the undertaking to a successful issue, and breathe the breath of life into the plan. He proposed to manufacture only good watches, and the very first step would be a horological school, in which to educate the suitable forces that should furnish the first skilled heads and hands.

Assisted by the Government, Lange erected this school at Glasshutte, until then, one of the most impoverished towns in the Saxonian Erz Gebirge, to-

wards the end of the year 1845. He himself became its teacher. But it was not so easy to find a few smart, intelligent boys in the place that were willing to become his pupils, or whose parents were willing to acquiesce. They deemed that beside weaving and straw plaiting, such as had been pursued since ages bygone, nothing could be remunerative. With incredulity they listened to the representation of the, to them, stranger, who endeavored to explain to them the future prospects of such an industry in their remote valley. Ignorance is enemical to all innovation; accustomed misery resists every endeavor to alleviate it.

Finally, Lange succeeded in collecting a few dozen of sickly and weakly boys in a small house, in which he had established his school and shop. They had to learn the making of the parts of a watch movement from A to Z, to put them together, and to regulate the ready movement. Much patience was necessary, but Lange possessed it, and not all the many difficulties could cool his ardor, with which he had gone to work and pursued his plan. It did not require years before the first watches were sent from Glasshutte, of excellent, fine workmanship, constructed according to the latest scientific principles, and, above all, manufactured by those ignorant, sickly boys, his first pupils. It may rightfully be said that they became the fathers of the watch manufacture of Glasshutte—men who gradually convalesced both in body and soul, who acquired self-knowledge, executed their work with ambition, and were enabled to support their wives and children with honor, while several established in business for themselves.

But the beneficent influence of the humane watchmaker from Dresden, in years, became more and more visible in the town and vicinity of the Saxonian Erz Gebirge. His first pupils became teachers for other children when the factory manufacture was undertaken. Lange procured machinery and perfected tools; he obtained both the best and most perfect for his workshops, and invented and constructed others himself. Five years after the establishment of the factory, a fly wheel turned the finest parts of the watch, its pivots, pinions, etc. He was the first to construct the depthing theoretically correct, simple, and without show of artifice. The good fame of these watches has maintained itself to this day. In 1879, there were 160 people in Glasshutte that lived from this industry, occupying journeymen and apprentices. Of course, the main business, on a far larger scale, has remained in the hands of Lange & Sons.

The man who produced all this work, was permitted to witness its growth and flourishings for thirty years. He died December 5, 1875, heartily mourned by the entire town. The Government of Saxony, which also watched his endeavor with pleasure, honored his memory by establishing the well-known horological school at the place, which had been the great desire of his life.

When we see the rapidity and correctness to-day, by aid of divided labor, to make a watch, the perfection of which once the deepest study and the most painstaking artistic skill were not able to produce, the thinking mind will at once perceive the extraordinary technical development, and the assistance human labor has received at the hand of science. The watch is also an indicator of the science of our times. Its perfections, as it were, shows the progress of work, and also expresses its increase in value. Time, once so cheap, has become of much value. And as the hands of the clock, indispensable to-day in every house, accomplish their course in a mysterious manner, thus also courses civilized humanity, from progress to progress, higher and higher, to the ideal which draws it onward, upward.—*Jewelers' Circular.*

THE PITT OR REGENT.

III

JOHN LAW AND THE FRENCH PURCHASE.

"Even after refuting the calumnies of his enemies, Pitt knew little rest until he was quit of his costly jewel. He was constantly haunted by a morbid fear of losing or being robbed of it, so that it was with great difficulty he could ever be induced to exhibit it even to his most intimate friends. The German traveller, Offenbach, when visiting England in 1712, anxious to see all the sights of the metropolis, made several vain attempts to get a view of the gem, which had already became famous throughout the west. While it remained in his possession the ex-Governor never slept two nights running under the same roof. He moved about capriciously or in disguise, and never gave previous notice of his arrival to, or departure from, town.

At last he was relieved of further anxiety by the negotiations, in consequence of which the Pitt became the Regent, passing from its English owner into the hands of the Duke of Orleans, Regent of France, in 1717. After being cut in the form of an almost faultless brilliant, a model of the diamond was taken, which is now in the British Museum, and on the silver frame is engraved the legend: 'This is the model of Gov. Pitt's diamond, weight 136½ karats; was sold to Louis XV., of France, A.D. 1717.' This model, or rather a duplicate without the frame, had been sent to Paris and submitted to the famous Scotch financier John Law, at that time at the height of his power in France. Law took the stone first to the Regent, and then to the Duc de Saint Simon, (Saint Simon, who seems to have known nothing of its early history, asserts it was stolen by a person employed in the Indian diamond fields, who brought it to Europe. After showing it to the King of England and several other English noblemen, he took it to Paris, where he submitted it to Law. Then followed the particulars of the negotiations with the French Regent, as stated in the text,) who gives a full account of the affair in his 'Memoirs.' Saint Simon agreed with Law that France ought to possess a gem which up to that time was incomparably the finest ever seen in Europe. Yielding to their combined efforts the Regent at last consented to purchase it for £135,000, (but on this point the authorities are at variance with each other. Board says the figure was 2,250,000f.; Jeffries, £125,000; others, £130,000,) including £5,000 for the negotiations, a euphinistic expression, which, translated into plain language, meant a bribe for Law. Money, however, was just then so scarce that the interest alone was paid on the amount, jewels being given as security for the principal until it was paid off. This price, great as it may appear to be, was even then as much below its real value, and in the inventory of the French crown jewels, drawn up in 1791, it is valued at 12,000,000f., or £480,000.

in Paris, the whole of the French Regalia disappeared, and with it the Pitt, now the Regent, which stood at the head of the list. The remarkable circumstances attending this famous robbery of the Garde-Meuble are thus related by M. Breton editor of the *Gazette des Tribuneaux:*

'The inventory of the crown diamonds, made in 1791, in virtue of a decree of the Constituent Assembly, had scarcely been completed in the month of August, 1792, at the time of the last public exhibition, which took place on the first Tuesday of every month. After the sanguinary events of Aug. 10 to Sept. 2, this rich treasury was naturally closed to the public, and the Paris Commune, as representing the State property, put its seals on the cabinets in which had been placed the crown, the sceptre, and other ornaments of the coronation service. The golden bequeathed by Cardinal Richelieu to Louis VIII., with all the accomanying diamonds and rubies, and the famous golden vase, weighing 106 marks, besides a vast quantity of other vases in agate, amethyst, and rock crystal. On the morning of Sept. 17, Sergent and the two other Commissioners of the Commune perceived that during the night robbers had made their way in by scaling the colonnade from the side of the Place Louis XV., and through a window looking in that direction, having thus got access to the vast halls of the Garde-Meuble, they had broken the seals without forcing the locks, carried off the priceless treasures contained in the cabinets, and disappeared without leaving any other traces of their presence. Several persons were arrested, but released after a protracted inquiry. An anonymous letter, addressed to the Commune, stated that some of the objects were in a ditch in the Allee des Veuves, Champs Elysees. Sergent at once proceeded with his colleagues to the spot, which had been very carefully indicated. Here he found among other things, the famous Regent diamond and the no less famous agate-onyx cup, known by the name of the Abbe Suger's Chalice, which was afterwads placed in the cabinet of antiques in the National Library.

'Notwithstanding the investigations made at the time and subsequently, it remained uncertian whether this robbery had a political object, or whether it was simply the act of ordinary criminals, undertaken at a time when the guardians of the public security were in a state of complete disorganization. Some said that the proceeds of these treasures were intended to maintain the army of the emigrants. Others, on the contrary, pretended that Pethion and Manual had used them to obtain the evacuation of Champagne by giving up the whole to the King of Prussia. Some even went so far as to assert that the keepers themselves had broken open the cabinets, and Sergent, of whom we have above spoken, was nick-named Agate in consequence of the mysterious way in which he had found the agate-onyx cup. But none of these more or less absurd surmises ever received any judical confirmation.

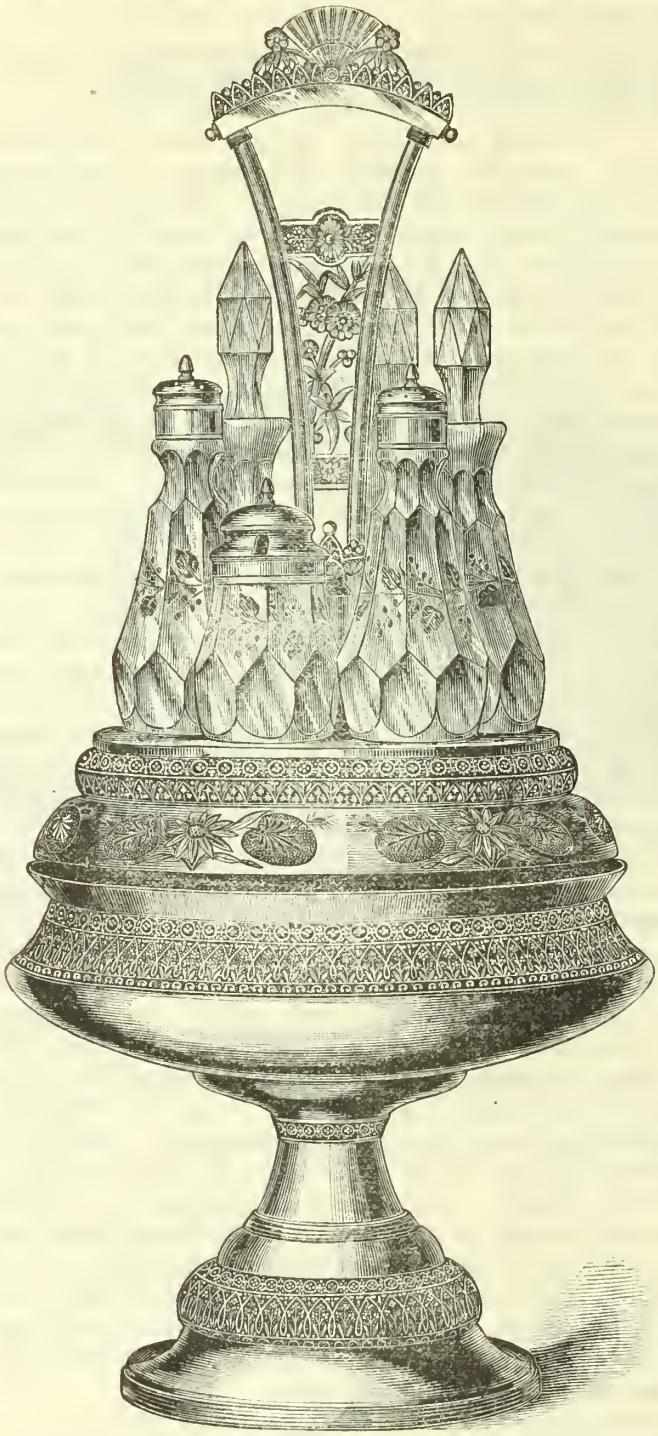
Nevertheless, there was one circumstance of which I was witness, jointly with the others present at the sitting of the special criminal court of Paris, when Bourgeois and others, accused of having forged notes on the Bank of France, were put upon their trial in 1804. One of the accused, who had assumed the name of Baba, had at first denied all the charges brought against him, but during the proceedings he made a complete confession, and explained the ingenious devices employed by the forgers. "It is not the first time," he added "that my revelations have been useful to society, and if I am now condemned I will implore the Emperor's pardon. But for me Napoleon would never have mounted the throne; to me alone is due the success of the Marengo campaign. I was one of the robbers of the Garde-Meuble. I had assisted my associates to bury in the Allee des Veuves the Regent and the other easily recognized objects, by which they might have been betrayed. On the promise of a free pardon—a promise that was faithfully kept—I disclosed the hiding place. Here the Regent was recovered, and you are aware, gentlemen, that this magnificent diamond was pledged by the First Consul to the Dutch Government, in order to raise the money of which he stood in the greatest need after the eighteenth Brumaire.'

"The criminals were all condemned to the galleys except Bourgeois and Baba, who were sent to the prison of Bicetre, where they died. I do not know whether Baba made any further revelations beyond what I have reported, and which may also be read in the *Journal de Paris* of that date.'

"Since its recovery and redemption from the Dutch Government, the Regent seems to have remained in the French Treasury to the present time. The first Emperor is known to have worn it in the pommel of his sword, and Barbot tells us expressly that it was publicly shown among the crown jewelry at the Paris exhibition in 1855. Still, it is remarkable that this brilliant does not figure in the inventory of the State jewels drawn up by order of Napoleon in 1810, not apparently in any of the subsequent official reports on the crown jewels. This circumstance, however it is to be explained, had doubtless lent some coloring to the many conflicting statements regarding its subsequent vicissitudes. Kluge asserts that after its recovery in 1792 it was pledged, not to the Dutch Government, but to Treskow, a merchant in Berlin. He also refers to the highly improbable report that after the battle of Waterloo, where the Prussians found it in the Emperor's State carriage, it was carried off to the Prussian Treasury. If it really was taken to Berlin on that occasion, it was subsequently restored to the French Government, for Ersch and Gruber, writing in 1833, distinctly state that at that time it was 'the first diamond in the French Treasury.' Barbot also justly regards it as the most conspicuous gem in the now disused crown of France. This crown, which also contains eight other diamonds, weighing from 19 to 28 karats, is thus by far the richest in the world.

"The form of the Regent is somewhat round, an inch broad, $1\frac{1}{6}$ of an inch long, and $\frac{3}{4}$ of a inch thick. It was reduced in cutting from 410 to $136\frac{7}{8}$ karats, and has been estimated to be worth £480,000.

THE EUGENIE.



WORN IN A NECKLACE BY EUGENIE, IN A HAIRPIN BY CATHERINE.

"A perfect brilliant of 51 karats, of an oval shape, blunt at one end, and very beautifully cut, this diamond was set as the centre of a hair-pin belonging to the Empress Catherine II. of Russia. When Potemkin became her favorite, she made him a present of it as a proof of her esteem, and to reward him for the great services he had rendered to his country. This man unlike her other favorites, was

SIMPSON, HALL, MILLER & CO.

endowed with more than mere personal attractions. He had great natural abilities and presence of mind. Catherine bestowed upon Potemkin for his services, both military and diplomatic, the surname of Taurisschesky. [This name was taken from the Kersonesus Taurica, (Crimea,) which was added by Potemkin to the Russian Empire.] It was at this time he received from Catherine a magnificent palace called (conformably to this name) the Tauria, together with the diamond now known as the Eugenie. The Emperor Napoleon III., on the occasion of his wedding, bought this stone from a grand-niece of Potemkin, the Princess Colorado (who was, at the same time, the heiress of all the jewels belonging to the Russian Prince,) and gave it to his wife.

"The Empress of the French renamed the stone Eugenie, and it is from her majesty's own lips that we received our information. During the whole of her reign the Empress wore this gem as a centre stone of a diamond necklace, which, after the Franco-German war, was sold to the notorious Gaikwar of Baroda for a lac and a half of rupees, (£15,000.) This was the man who attempted to distroy the British Resident, Col. Phayre, by administering diamond powder to him, for which he was tried by a jury of three Englishmen and three natives. He was defended by Sergent Ballantyne. The judges could not agree, and the Gaikwar was discharged. He was, however, after the trial deposed for his misgovernment, and since then the Eugenie, together with many other large diamonds purchased by him, have disappeared. He is supposed to have hidden them away, in the hope of raising money on them for the purpose of an attempt to recover his possessions."

BUSINESS CHANGES FOR DECEMBER

W. J. Reid & Co., Wholesale Crockery and Plated Ware, dissolved, N. & W. J. Reid continue under the old style; C. F. Smith & Co., Belleville, Ont., Hardware, damaged by fire; W. A. Boughner, Ridgetown, Ont., Hardware, has sold out and trying to compromise; A. J. Winchell, Tilsonburg, Jeweler, assigned in trust; J. L. Levy, Toronto, Jeweler, giving up business; T. J. Carrol & Co., Hamilton, Ont., Jobbing Jewelers, stock seized by customs' authorities; Dale & Kemp, Beeton, Ont., Hardware, called a meeting of their creditors; T. W. Gibbs, Oshawa, Ont., Hardware, sheriff in possession; Whetter & Lawrie, Forest, Ont., Hardware, dissolved, and A Lawrie continues alone; Lee & Edsell, Bowmanville, Ont., Hardware, dissolved, Edsell continues alone.

BUSINESS NOTES.

Christmas Trade has generally been good this season, and most of our friends throughout the country report good sales and fair prices. As usual those who bought for cash on hand, had an inside track on their competitors.

The many friends of Mr. John Zimmerman throughout Canada, will regret to learn that he has been so ill for a month past as to be compelled to keep to his bed. We are glad to be able to say that he is now rapidly recovering from his illness, and his medical adviser expects that he will shortly be able to attend to his business as usual.

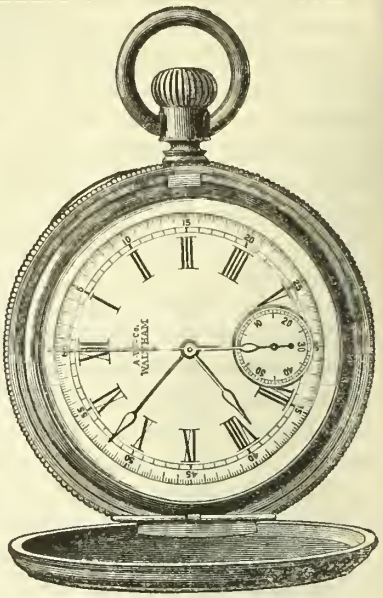
In our November issue, by some oversight of our printer of course, a strange error crept into the advertisement of Hagstoz & Thorpe, manufacturers of the Boss Case. It was there stated that 15,000 of their cases had been sold to the public, whereas it should have read 150,000—just one little 0 left out, but it made a difference of 135,000 in the number of cases sold by the Company. As a matter of fact, these Boss gold stiffened cases are a "big thing" not only to the manufacturers themselves but to the man that buys them; and those who have used them say that they are first-class value for the money. We think them without doubt the best stiffened gold case in the world, and the immense sales made by the manufacturers in this country and Great Britain, seems to indicate pretty conclusively that the general public think so also.

It seems that the Customs department are beginning to open their eyes to the fact that jewelry is extensively smuggled across the border, and in many places this is accomplished by regularly organized gangs got together for the purpose. The detectives have again succeeded in making a capture, this time at Sarnia, or rather Point Edward, the crossing point of the Grand Trunk Railway. About two weeks ago a well known American Doctor and an American Jeweler were caught by Customs detective, having in their possession over $1,000 of jewelry. The jewelry was confiscated and the culprits fined $200, and it is said that the end is not yet, but that other arrests are about to be made. We think some of these detectives might employ their time with equal profit further east, as it is a well known fact that large quantities of smuggled goods are constantly being offered in Toronto at prices which defy competition from any honest dealer. If the department won't reduce the duty they should at least see that it is collected from all.

Talking of Customs seizures, reminds us that it is only a few days ago since the Customs authorities seized the entire stock of a small jobbing jewelry firm in Hamilton, for smuggling goods, and as a consequence the firm has since suspended operations. Well we should say that if they could'nt do business honestly, the sooner they go by the board the better, and if the charge is fairly sustained, we trust that their creditors will allow no false delicacy to prevent them from putting the "*coup de grace*" to such a concern. "Honesty is the best policy" is an old adage and a true one, and if people will persistently run their heads into danger they must eventually expect to be caught. It is said that the detectives will after the examination of the firm's books make a good many seizures amongst the dealers who purchased from this firm. If so it will serve as a point to illustrate our remarks in last number in reference to the danger retail dealers run in buying from small and irresponsible houses with small capital but a big reputation for selling cheap.

The selection of some one standard meridian, so as to have the same minute and second simultaneously throughout the world, will become more inevitable as travel and communication increases. The clumsiness of the present system is evident when it is considered that in the United States alone there are seventy standards. The revolution will be gradual, but is sure to come sooner or later. On Thursday last, in the Section of Economical Science and Statistics, the President of the Section, Prof. E. B. Elliott, of Washington, read a paper on "International Standard Time," Mr. Sandford Fleming, C. E., in the chair. As to the selection of a standard meridian, he proposed Behring's Straits for two reasons—first, because the time differs but little from Greenwich, being but forty-four minutes faster than at the sub-meridian of Greenwich; and secondly, because the line for zero would be situated entirely in the water, and the inconvenience avoided of having it Monday to people living on one side and Tuesday to those on the other. As to numbering the meridian from the standard, twelve on the dial would mark midnight as well as noon, while on a 24 hour watch zero would mark midnight and twelve noon, the meridians moving as usual from west to east. According to this standard, dividing the 360° of the circumference of the earth by 24, the number of hours in a day meridian A 15° from zero would be first hour, meridian B 30° from zero the second hour, and so on. The American Congress has authorized the appointment of three commissioners to unite in an International Conference for the purpose of deciding on a common meridian.

WORKSHOP NOTES.



Silvering Copper and Brass.—Mix 3 parts of chloride of silver with 20 parts finely pulverized cream of tartar, and 15 parts culinary salt. Add water in sufficient quantity, and stir until the mixture forms a paste, with which cover the surface to be silvered by means of blotting paper. The surface is then rubbed with a rag and powdered lime, washed, and rubbed with a piece of soft cloth. The deposited film is extremely thin.

Lever Pallets.—The clear space between the pallets should correspond with the outside measure, on the points of three teeth of the scape wheel. The usual mode of measuring for new pallets is to set the wheel as close as possible to free itself when in motion. It can be arranged in the depthing tool, after which the measurement between the pivot holes of the two pieces, on the pillar plate, will show you exactly what is required.

Gold Dials.—In order to restore the color to a gold or gilt dial, dip it for a few seconds in the following mixture: Half an ounce of cyanide of potassium is dissolved in a quart of hot water, and two ounces of strong ammonia, mixed with half an ounce of spirits of wine, are

THE NEW WALTHAM WATCH CHRONOGRAPH.

The Best Watch now in the Market for General Use.

SOLD IN GOLD CASES ONLY

Fourteen and Eighteen Carat Fine. Quality Stamped and GUARANTEED by the Company.

This watch is of medium size, and made to indicate and register the fifth second.

By new inventions and the application of American Machinery, THE AMERICAN WATCH CO. has so simplified the manufacture of these Watches as to greatly reduce their cost, and they can now be obtained at prices which make them the MOST DESIRABLE time-piece for all classes of watch wearers.

ROBBINS & APPLETON, General Agents,

NEW YORK.

added to the solution. On removal from this bath, the dial is immediately immersed in warm water ; then brush with soap rinse, and dry in hot boxwood dust. Or it may be simply immersed in dilute nitric acid, but in this case any painted figures will be entirely destroyed.

Galvanic Gilding.—A correspondent inquires how to obtain a pure ground and color on articles gilt by galvanism, to which H. Bush, responds : The gold solution, effected by the nitromuriatic acid, after all the gold has dissolved in the glass retort, is poured into a porcelain evaporating dish,and evaporated above an alcohol or benzine flame ; to render the acid entirely harmless, however, a little distilled water is added to the residue, after completed evaporation, and the operation repeated. The residue is chloride of gold, which, together with a quantity of cyanide of potassium (about fourfold the weight of the gold employed), is dissolved in boiling water, and filtered after cooling ; the gilding fluid is ready.

Watch Cleaning.—A few watchmakers clean by what is called the chemical process, to remove discoloration from watch movements. It is as follows : Remove the screws and all steel parts, then dampen with a solution of oxalic acid and water. Let it remain a few minutes, after which immerse in a solution made of one pound cyanuret potassia to one gallon of rain-water. Let remain a few minutes, and then rinse well with clean water, after which you may dry in sawdust, or with a brush and prepared chalk, as it suits your convenience. It gives the work an excellent appearance.

Non-Corrosive Soldering Fluid.—A noncorrosive soldering fluid is prepared in the following manuer : Small pieces of zinc are immersed into muriatic acid to saturation, which can be known by the cessation of the ebullition ; the zinc, also, being added after this point remains undissolved ; add about one-third the volume of spirits of ammonia, and dilute with a like quantity of rain water. If the acid is gently heated at the time of adding the zinc, the dissolving will progress much more rapidly. This fluid causes no rust ou iron or steel, and is even excellent for tinning.

Hardening Pinions.—"Which is the best way to temper pinions and other steel parts?" I wish to inform the interrogator that I have used petroleum for several years with the most excellent results. The steel parts to be tempered are first heated upon charcoal, in the customary manner, then annointed with ordinary washing soap, heated cherry read, and quickly immersed in petroleum, without auticipating that the latter might ignite. Steel articles heated in this manner do not warp whatever, no matter how thin, and remain almost entirely white.—B. Morjossy, *Deutsche Uhrm. Ztg.*

Tempering Case Springs.—Draw the temper from the spring, and fit it properly in its place in the watch ; then take it out and temper it hard in rain-water, (the addition of a little table salt to the water will be an improvement); after which place it in a small sheet iron ladle or cup, and barely cover it with linseed oil, then hold the ladle over a lighted lamp until the oil ignites ; let it burn until the oil is nearly, not quite, consumed ; then re-cover with oil, and burn as before ; and so a third time, at the end of which plunge it again into water. Main and balance springs may in like manner be tempered by the same process; first draw the temper, and properly coil and clamp to keep it in position, and then proceed the same as with case springs.

To Prepare Chalk.—Pulverize your chalk thoroughly, and then mix it with clean rain water in the proportion of two pounds to the gallon. Stir well, and then let it stand about two minutes. In this time the gritty mattor will have settled to the bottom. Pour the water into another vessel slowly, so as not to stir up the settlings. Let stand until entirely settled, and then pour off as before. The settlings in the second vessel will be the prepared chalk, ready for use as soon as dried. Spanish whiting, treated in the same way, makes a very good cleaning or polishing powder. Some operatives and a little crocus, and we think it an improvement ; it gives the powder a nice color at least, and therefore adds to its importance in the eyes of the uninitiated.

In order to obtain a clear ground and color of the gilding, cleanliness in the process of preparing the fluid, as well as of the article to be operated upon, is unconditionally necessary ; the zinc strip, also, must be kept very clean. The mat ground of the gilding is changed into a lustrous one by scratch-brushing the article after removing it from the bath, with a brush consisting of brass or German silver wire, or glass fibers, using beer. The article is next rinsed in warm water, and dried in sawdust.

Another one answers to be same question : After having evaporated the dissolved gold to a proper consistency, add the point of a knife full of bicarbonate of soda, and a clear and handsome gilding will be obtained.

The employment of essences in cleaning watches is rapidly growing in favor among watchmakers. They are to be obtained at many of the material dealers, together with full instructions in regard to their use. The objects are left in the solution for a few minutes, in order to allow all adhering matter to dissolve ; but they must not remain too long,as certain quatities of benzine, etc., are apt to leave stains. Dry the pieces on removing them, and finish by passing over a fine brush that has been charged with chalk, and subsequently rubbed on a hard crust of burnt bone. This will produce a brilliant surface on either gilding or polishing brass. The following composition, the ingredients of which can be obtained at any drug store, has been strongly recommended : 90 parts by weight of refined petroleum, and 25 parts by weight of sulphuric ether. The objects are immersed for several minutes ; indeed, they may remain for a much longer period without danger, and on removal from the bath are found to be clean and bright. It must not be forgotten that many of these essences are liable to ignite with the mere proximity of a lamp.

—We give a few condensed rules to be remembered by the workman when regulating a watch to positions commensurate to its motion, or the experience or estimation of the workman :

1. Make the balance pivots flatter or rounder.

2. Let the balance jewel holes have only the necessary thickness of the hole.

3. Make the balance pivots weaker, according to circumstances, and insert new and smaller jewel holes in the place of the old ones.

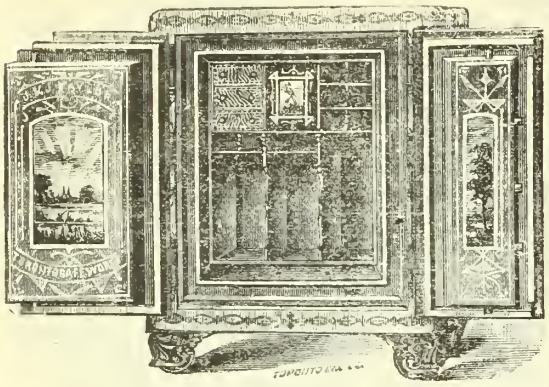
4. Centre the balance spring truly, or, according to circumstances, fasten and lay it thus that by the handing of the watch, the spring operates in such a manner upon the balance as to raise it, whereby the friction within the jewel holes is lessened.

5. Change the balance spring with another one of the same strength, but with more or less coils.

6. Change the fastening point of both, so that the balance spring is lengthened or shortened, and the points of fastening stand at a different angle to each coil.

7. In a watch with Bréguet spring, make the outer curve longer or shorter.

8. Put in another balance of a larger or smaller diameter or weight.



9. In a cylinder watch, give the balance a point of gravity.

Keep these rules uppermost in your mind, when engaged in regulating, and always remember at the same time that the operation offers many difficulties, only to be conquered by a prolonged experience, observation, and a careful study.

SCIENCE NOTES.

Dainty Jewel Work—They used to do some very dainty work in olden times in the way of jewelry, if one can take the historian's word for it. In Elizabethian times one Mark Scaliot constructed a lock of eleven pieces of iron, steel and brass, and a chain of forty-three golden links was attached to the same, and this being placed around a flea's neck, lock and chain and flea weighed only a grain and a half of gold. Surely such a miracle of skill was worth preserving for posterity. Oswald Nothingerus once turned 1,600 dishes of ivory which all went into a peppercorn, if, indeed, we may believe contemporary writers. They were shown to Pope Paul V., who counted and verified them himself, by the aid of a magnifying glass. Father Ferrarius, a Jesuit, would not be outdone, and he made twenty-five wooden cannons, which went into the same compass.

Remarkable Discovery.—A remarkable discovery, the result of which may be of importance, has been made by Mr. Spring. In 1850, Faraday discovered that two pieces of ice, strongly pressed together, very quickly adhered and formed a homogenous mass, although he considered this property as a peculiarity simply belonging to ice, and his theory is still explained thus in mathematical and philosophical classes. But Mr. Spring has found out recently that the most diverse bodies behave in a similar manner, when submitted to the same process. He took fine powders and submitted them, in a steel mould, to pressures varying from 2,000 to 7,000 atmospheres; under these conditions, the iron filing was transformed into a solid block, not showing the least traces of granular structure when examined by the microscope. At 5,000 atmospheres, lead became fluid, and zinc gave blocks of a crystalline structure. This discovery may perhaps be used for molding metal without reducing it to fusion.

THE wife of the great French naturalist, M. Geoffroy Ste. Hilaire, once lost a handsome diamond necklace, and the house was in an uproar in consequence of the vanished bauble. Incidentally the naturalist mentioned that a favorite baboon, which he kept upstairs, had been playing for some days past with a necklace precisely similar to the one described. He was indignantly asked why he had not taken the necklace from the animal. "I thought that it belonged to him," calmly made answer M. Geoffroy Ste. Hilaire. The naturalist had lived so long with animals, he had become so thoroughly absorbed in their habits and idiosyncracies, that he could see no kind of incongruity in a monkey possessing a diamond necklace. Thus Fransham, the Norwich polytheist, when somebody left him a legacy of £25, proposed to buy a pony with the money. It was notorious that he could not ride, and he was asked what he wanted a horse for. "To walk about with and talk to," was his reply.

THERE are in use between Albany and New York thirteen electric clocks, two of the number being placed in the waiting rooms, and one in the dispatcher's office at the Grand Central Depot, New York. The time on the clock at the depot at East Albany corresponds exactly with the time in New York. Each one of the clocks is connected with the general superintendent's office in New York, in which the railroad time is kept on what is called the "big clock." Conductors, train men, and others, are compelled to keep their watches in strict conformity with the superintendent's clock. It is set by standard time, and connected with the time service department of the gold and stock telegraph. The time is distributed all over the line each weekday, as follows: At 10 o'clock 58 minutes and 3 seconds A. M., the word "time" is sent by the main office to the telegraph stations between New York and Albany. This word is repeated for 28 seconds, during which time operators must see that their instruments are adjusted. At 10 o'clock 28 minutes and 50 seconds, seconds commence beating, and continue for 50 seconds. The word "switch" is then sent over the wire, and operators having electric clocks connect them immediately with the circuit known as No. 9 wire. Ten seconds are allowed in which to make the connection. At 11 A. M., with one touch of the New York key, the hands on the different clocks are set to 11 o'clock.

A CORRESPONDENT of the *Jewelers' Circular* in Louisville, Ky., writes that he has in his possession a curious ring, which formerly belonged to his great-grandmother, who lived in Germany, and that he is inclined to think it was Martin Luther's wedding or engagement ring. On the inner surface is engraved, "D. Martino Luthero—Catharina W. Boun, 13 Juni, 1525." The owner describes his treasure as follows: "On one side of the ring is carved a representation of the Crucifixion; the cross is carved through the gold, and the outlines of the figure stretched upon it are very fine. In the centre of the cross-piece of the cross is a fine ruby, around which are carved these letters, I. N. R. I. Just at the foot of the cross on the right is carved a head with a Bishop's hat on it, and on the left side of the cross is a palm; on the other side of the ring are carved a ladder and spear, and between these is an anchor around which is twisted a rope. The gold in the ring is very fine and of a pale hue, and has not the appearance of being so old. I can trace it back about 150 years. How the ring was obtained by my great-grandmother I do not know, but the family were ardent Lutherans, and I think may have gotten possession of the ring in this manner." Martin Luther was undoubtedly married on the 13th of June, 1525, but his wife's name was Katherina von Bora, not Catharina W. Boun, and the present owner of the heirloom will probably do well to take a reasonable pride in possessing a ring which once belonged to his great-grandmother, without attempting to identify it with the hero of the German reformation.

IN LIGHTER VEIN.

QUIEN SABE?

If the dance is most terribly hot,
And the stairs have not one vacant spot;
If we happen to go
Where the cool breezes blow,
Who will know?

If the moon most discreetly doth hide,
And the path it is not very wide;
What if closely we walk,
The better to talk,
Who will know?

If the light is so very obscure,
And the rose is so hard to procure;
If one gently doth bend
Assistance to lend,
Who will know?

If young toads gambol wild in the shade,
Then what marvel that one grows afraid;
If for safety from harm
One leans on an arm,
Who will know?

If "bangs" are a little bit crushed,
And cheeks are a trifle more flushed;
Well—and if it is false,
The cause was the waltz,
Who will know?

W. G. THEVISTON in "Our Continent."

The Watchmaker, Jeweller and Silversmith,

A Monthly Illustrated Journal. Published in London.

The Representative Organ of the Watch, Jewellery and Kindred Trades in the United Kingdom.

It is full of original information and thorough practical instruction contributed by the leading writers on the various subjects connected with the above trades. The text is well illustrated by wood-cuts, and two supplements of artistic designs for jewellery, etc. accompany each number.

This important Trade Organ, now in its seventh year of publication is in the hands of every British Watchmaker, Jeweller and Silversmith, and is therefore a most valuable medium for manufacturers requiring publicity in Great Britain.

Our list of permanent contributors includes such names as: J. U. Poole, Richard Whittaker, Henry Ganney, Moritz Grassmann, J. Herrmann, E. J. Watherston, W. H. Singer, an ample guarantee for the sterling value of the journal. Subscription 5s. per annum.

Editorial.

THE HOLIDAY TRADE.

The holiday trade is over at last, and our merchants have now leisure to sum up the results of the rush, and jam, and bustle of the few weeks preceding the new year.

As far as we can learn, the results on the whole have been highly satisfactory, and our merchants in nearly every quarter express themselves as being highly pleased with the volume of trade done, and the manner in which payments have been made. It is probably a good job that Christmas comes but once a year, for its duties are a severe strain on the energies of the merchant as well as on the pockets of the consumer. We trust that the regular trade that should follow at this season of the year will not be in any way injured by the extra efforts that have been put forth to secure the holiday patronage. The indications at present seem to point to a winter and spring trade fully up to if not ahead of the average run for the same period.

THE COMMERCIAL BAROMETER.

The winding up of the year 1882 has again brought us the valuable and well digested annual circular of the Messrs. Dun, Wiman & Co. Mercantile Agency. The facts and figures thus published by this enterprising firm are of so much value to every mercantile man in this country that we take the liberty of presenting them to our readers entire, and trust that they will "read, mark, learn and inwardly digest," not only the information given therein, but the lessons that may be deducted from them.

Shakespeare says we can find "sermons in stones, and good in everything." Without contradicting him, we can safely say that a most useful lesson may be derived by every thinking man from a quiet perusal of the failure tables which we give below.

A glance at them will suffice to convince the most sceptical that, in spite of protection and good crops, and many other favourable circumstances, the lowest point in the tide of commercial failures in both Canada and the United States has been reached, and that we are again on the up grade of the mercantile highway. This does not necessarily imply that our business men are all going to the wall, or that we are going to have an immediate return of the "old hard times." It simply means that these figures are a warning to merchants and mercantile men generally to shorten sail and prepare for squalls. The fact is that credit is too cheap in Canada, and it is simply on account of the ease with which they can get goods that many merchants incur debts which ultimately lead to their failure. We do not think there is the slightest necessity for any alarm at the present trade prospects; all we say is that the indications at present point to the necessity of avoiding all unnecessary risks and of keeping one's business well in hand, so that come what may, they may be prepared if the storm should break.

From the tables below, which embrace the failures for the past six years, it will be seen that in the year 1881 Canada reached the lowest point as regard the number of failures, the present year showing an advance of 152 in number, and $2,836,450 in amount.

"The Canadian figures are as under for six years past:—

	No.	Amount.
1877	1,892	$25,523,903
1878	1,697	23,908,677
1879	1,902	29,347,937
1880	907	7,988,077
1881	635	5,751,207
1882	787	8,587,657

There is this difference between the statistics for the United States and those of Canada, as furnished by the authority quoted, that while the lowest point was reached by our neighbors in 1880, when the mercantile failures were 4,735 in number and $65,752,000 in amount, our failures had not reached the minimum of the period until 1881. The United States figures for these years are as follows:—

	No.	Amount.
1877	8,772	$190,669,926
1878	10,478	234,383,132
1879	6,658	98,149,053
1880	4,735	65,752 000
1881	5,582	61,155,922
1882	6,738	101,557,564

Analysis of the localities and comparative amounts of these failures for 1882 shows that while in Canada there was one failure for every 77 traders, the United States furnished but a failure for every 122 traders. The Pacific States and Territories alone furnished a parallel for the relative number of Canadian failures; these were as 1 to 68 traders. In the Southern States they numbered 1 to 78; in the Eastern States, 1 to 114; in the Middle States, 1 to 149; and in the Western States they were least numerous of all, being but 1 to every 151 traders.

The circular regards as a most unpleasant feature of the situation across the line the fact that an increase of failures should be shown when the conditions are so extremely favorable to the prosperity of the country. The chief reason for this anomalous exhibit is considered to be 'beyond question, the alarming extension of the lines of credit, which the two last years have witnessed.' Respecting the prospect of trade in that country for the new year, Messrs. Dun & Co. say: 'It is difficult to discover any element of a disturbing character, except, perhaps, over-production by manufacturers; pressure to sell goods; a tendency to extend credits unduly; and the dangers which result to individuals owing more than they can readily pay.' Canada, we remark, is by no means free from these very elements of possible disturbance, and it were wise for our bankers, merchants and manufacturers, who have it in their power to limit these threatening features, to act with the caution which the circumstances demand."

THE MILWAUKEE HORROR.

Probably nothing, since the terrible boating accident on the Thames at London two years ago, has created more wide spread consternation than the burning of the Newhall House at Milwaukee a couple of weeks ago. The "London horror" was worse as regards the number of lives lost, but bad as it was, it scarcely appeals to the mass of people

with half the effect that the "Milwaukee horror" does.

The reason is not far to seek; people that go on the water in overcrowded steamers are always exposed to a certain amount of risk, and when an accident does happen, it cannot be said to have been altogether unlooked for. Thus in the London accident, there were many, who, seeing the overcrowded state of the boat, refused to venture upon it, and thereby saved their lives. In the "Milwaukee horror," however, there seems to have been no premonetary warning of the dreadful danger the guests were exposed to, and the probability is that most of them lay down to rest feeling as safe and secure as they would have done in their own homes.

Hotels are generally supposed to have special safeguards thrown around them in case of fire, and up to the present time the public have had the utmost confidence in their fire extinguishing arrangements and the promptitude with which they could be put into operation.

If the Newhall House is any criterion of how these patent fire protecting apparatus work, we certainly think that the public will insist on having something more practical and certain in its application. The trouble seems to have been with the elevator, which, acting as a huge chimney, not only carried the flames from bottom to top of the building with lightning rapidity, but supplied the conflagration with all the air necessary to make it effective. Indeed we do not suppose that if an engineer were to try and construct a machine for the instantaneous firing of any large building, he could improve on this ordinary passenger elevator now in use in our hotels and public buildings. As usually constructed, they are lined with dry, seasoned wood, and the sides are well lubricated with the best of inflammable oils; all that they want is a start, and in a few seconds they can produce a flame as fierce as any that ever belched forth from the roaring mouth of a blast furnace.

Now that attention has been directed to this danger, the public should insist that these elevators should be made fireproof. The doors should be made of iron and kept securely closed after the elevator has stopped for the night. The inside should be made non-combustible in some way, either by the use of brick or iron lining, fire-proof paint, or some other device equally effective. It is customary in theatres to have iron screens between the stage and the audience, but in reality there is not one-half the danger to a crowd of wide awake people in a theatre that there is in a lot of half-awake people, who, roused from their beds, and not having even their ordinary senses about them, have to fight for their lives in the midst of a fog of unknown darkness and death.

We think that every hotel should have a fire bell in each bed-room, with a printed card attached, telling its guests plainly that this bell was connected with the office of the hotel, and would be rung only in case of an alarm of fire. If such were done, it would be impossible, as it is too often the case at present for people to be burned in their beds without having any chance for their lives. In first-class hotels, having electric bells, this could be very easily and effectively managed.

In addition to this every hotel should be compelled to provide fire escapes of some kind from every room in the house. For a lack of better, a simple knotted rope long enough to reach the ground would be a most effective means of escape, and we venture to say that if every room in the Newhall House had been provided with one of these primitive inventions the loss of life would have been very small compared to what it was.

We think parliament should take this matter up, and legislate so as to make the lives of travellers more safe than they appear to be at present. Our hotels are really the only homes that thousands of our fellow citizens have, they are public institutions, and ostensibly agree to provide their guests with food and shelter and safety. If the Newhall House is a fair sample of our hotels, and we are sorry to say that we know more than a score of such places in Canada, the sooner that the matter is legislated upon the better.

We compel steamboat owners to provide life-boats and life-preservers for every passenger in anticipation of an accident; we compel the proprietors of all public buildings to hinge their doors so as to open outwards, in short we legislate in every conceivable way in order to make life as safe and secure as possible. The same thing should be done in the case of hotel keepers regarding the safety of their guests, and all the more so because, trusting implicitly to the reputation of the house, they are practically helpless.

Many old travellers when going aboard a steamer make a thorough inspection of the vessel, and find out all about the arrangements of the life-boats and life-preservers so that if necessity arises they know exactly where to lay their hand on on them. In like manner when putting up at a strange hotel, they examine thoroughly the protections against fire, and their best avenues of escape in case anything should happen during their stay.

This is an excellent idea, and one that is easily carried out, the only difficulty about it is to be able to keep your wits about you and to be able to take advantage of your knowledge when the crucial moment comes.

Few people have self-control enough to make the most of their chances in such an emergency, and we think, therefore, that the strong arm of the law should be invoked to compel hotel-keepers to provide such safeguards for the escape of their guests from midnight peril as experience and common sense shall dictate.

Selected Matter.

A LOST OPPORTUNITY.

Sing, business muse, the dark and doleful fate
Of him who labors but that he may wait;
The piles of goods heaped up within his store,
Which can't be less, and never may be more;
The man whose life has lost all fortune's prizes;
In fact, the man who never advertises.

Sing of his start, his great ambition's scope,
The capital that gave him cause to hope,
His credit large, his full and ample stock,
His bank account as solid as a rock;
Then tell the doom to which the man was fated
Who never advertised, but simply waited.

So simply, and so vainly! Splendid signs,
With basement, art irradiates and refines,
Plate-glass show windows elegantly dressed,
Such lovely clerks, cashiers, and all the rest,
Served but to show him how the public sizes
The style of him who never advertises.

He waited, and all waited; clerks, cashiers,
Salesmen, saleswomen, such delightful dears,
Impatient waited all the season through,
With precious little for the crowd to do.
The public saw—that fact there's no denying—
But passed the store without a thought of buying.

Business was dull; but salaries and rent
Went on, till cash and credit both were spent;
The silly merchant hoped his luck would turn,
Until the Sheriff closed the whole concern.
Now, at a pittance which his soul despises,
He works for one who always advertises.

—*Hamilton Times.*

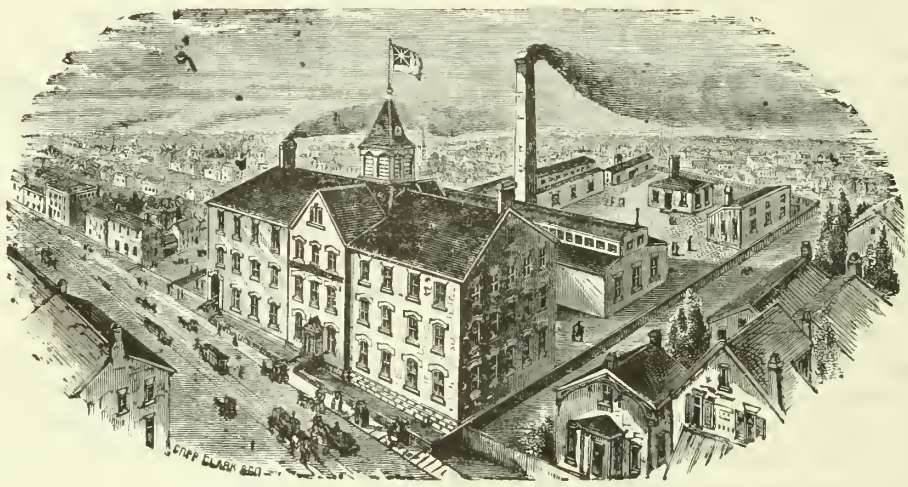
COMPARATIVE VALUES OF GEMS.

Scientists speak lightly of coloured gems as alumina found in nature, crystallized and coloured with oxide of iron, and "valued at enormous sums." It hardly raises the more precious in

general esteem to know that the emerald, ruby, sapphire and amethyst are almost the same chemically, or that the emerald and the aquamarine only differ in color, the former being absolutely priceless, while the latter has no determinate value. Pearls only are sold by the grain. All other precious stones are sold by the carat, which weighs four grains. Diamonds weighing less than a carat are more valuable than rubies, sapphires, or emeralds of the same weight. But all the colored stones exceeding a carat are more valuable than diamonds, and the difference in value increases very rapidly with increase of size. If a ruby is very perfect, and of a rich, dark color, it commands an extravagant price. A fine three-carat diamond might be worth from $600 to $1,000, according to quality, while a perfect three-carat ruby would find a purchaser at from $3,000 to $5,000. Rubies weighing four carats have been sold in Eastern cities for $10,000. Scientific writers class sapphires and rubies simply as sapphires. The red sapphire is a ruby, and the blue ruby a sapphire. The present demand for fine rubies exceeds the supply. It is not exactly known where those came from which are now finding their way into the market, but it is presumed that many are taken from old ornaments in family collections. Sapphires are very rare and scarcely less valuable than rubies. They make an exquisite appearance, properly arranged, and having small diamonds as foils. They are apt to show a dull color at night, and those are consequently most sought after which sparkle by gaslight. Large and perfect stones are of fabulous value. The Baroness Burdett-Coutts has a fine sapphire considered worth $160,000. Sapphires and emeralds are rarely set alone, but with smaller stones, commonly diamonds, which throw their beauty into relief. Except jewelers are not agreed as to whether the sapphire or the emerald is the more valuable, but the last, perhaps, maintains a greater popularity. Its value increases rapidly with its size. The wife of a railroad king purchased a fine ten-carat emerald a dozen years ago for $5,000, which is now worth probably $20,000. It is worn in a ring as a solitaire, and needs no foil to enhance its extraordinary beauty. There are said to be many rubies and emeralds in the city worth from $2,000 to $5,000, or even more, which are in the possession of connoisseurs.—*Exchange.*

THE SPIRAL STUD.

Who has not been a martyr to its damned inquisitiveness?



We see that there is a new shirt-stud invented, which goes through a gimlet-hole in a shirt bosom, in sections, and snaps together, leaving the under side smooth, so that there is no raw selvage to stick into a man's vital parts, the way there is in the old spiral stud, and we look forward to the happy future when we can buy a set of the new "Favorite" studs, and give the old spiral studs to the poor, who have no feelings to be lacerated. We have thought for years, that the government ought to call in the old spiral shirt-stud and issue a new kind, with coupons that will go together with a snap, but nobody has seemed to think the government ought to take the responsibility. The man who has invented the new stud should be placed on the pension roll with the man who invented the telegraph and the India rubber baby clothes. For a hundred years the spiral shirt-stud that screws in has held the stomach of a man in its grasp, and has made sore spots on him, when all should be sunshine, and so forth. It is said that women share our joys and our sorrows. This may be so, to a certain extent, and they may suffer some, but they don't know anything about the horrors of the spiral shirt-stud. Many men go down to their graves and never complain, who have had their lives made miserable by spiral shirt-studs. No man can be cheerful, full of fun and frivolity, and keep a company in a roar of laughter, when he is constantly reminded that three golden corkscrews are gently but firmly entering his body from three different places, that three different shows are getting in their work under one canvass at one price of admission. It is asking too much to expect a man to be entertaining when three artesian wells are being sunk into his person at once. Women do not mean to be cruel, and to cause unnecessary pains to man, but if they knew how they send the quivering arrows to his very soul, in three places, they would be careful how they throw their heads on men's shirt-bosoms and root around to find an easy place to lay. No doubt many of our hearers have noticed that men shrink from them when they lay their darling little heads on his breast and have thought the man was shocked at their actions. It is not that. It is the spiral shirt-stud. Of course, a man will stand a good deal, and not complain, under such circumstances, but if the woman in the case, or on the shirt-bosom rather, will look up into his fond eyes, she will find there, besides a look of satisfaction and don't-get-up-on-my-account expression, a far away penetrating look, as though his soul was on fire, or he had been eating cucumbers. Women can have no idea of the sacrifice man makes, in such cases, and they should not be surprised if he faints away. Other things in the world may cease, but the boring of the spiral stud never ceases. We have known a preacher to get a vacation of six months, with a trip abroad, because he looked sick, when all in the world that ailed him was spiral shirt-studs boring into him, though in this instance there was no female head acting as a screw-driver to drive them in. He would preach a sermon on faith, and look sick, as the studs went into him, and the congregation would pity him, think it was his liver, and raise money enough to send him all over the world. Oh, the spiral stud has done much to demoralize the world and it should be suppressed.—*Burlington Hawkeye.*

GOLD NUGGET SWINDLERS.

"Why, you've been swindled, man! That isn't gold quartz. You can't fool me on mineral; I've seen too much of the glittering truck to be caught on such a deal as that. Wouldn't have believed it of you, Charley!" and the speaker leaned up against the Windsor hotel counter with a look of painful disgust spreading over his features. You could have told he was a miner by the uncouth cut of his clothes, the looseness of his wide, soft hat, and the unkempt condition of his whiskers. The companion whom he addressed as Charley was an inoffensive-looking sort of a city chap; one of your young men who has seen a great deal of life, but not enough of its wiles, perhaps. He turned up the ends of his mustache ambitiously with one hand as he looked at the speaker in evident amazement. His other hand held a large piece of quartz, seemingly as rich as that which has given the Bowen mine its notoriety. "Don't say that, uncle," he said, nervously, rolling the quartz from side to side, "that specimen cost me $30, and I thought I was getting a good bargain, then." "Well, you can bet that I'm right," replied the uncle, with a harsh

laugh. "It's brass; the whole business is brass; there isn't a grain of gold in that rock. Let's go and have something."

As the two were walking towards the entrance to the bar, the one laughing, derisively, and the other looking like a man entering a pawn shop with his last suit of clothes under his arm, a reporter of the *Tribune*, who overheard the remarks quoted, tapped the uncle on the arm and asked what the conversation was about.

"O, not much, stranger, 'he said, suddenly checking his laughter. "It don't amount to much. Charley here, a young nephew of mine, who came from Illionis to meet me, ran against a brace game to-night, and the sharpers got the best of him. Funny, ain't it? Somebody has sold him a chunk of quartz stuffed with brass fillings for gold. He only paid $30 for the experience. 'T'ill do him good. I'm from Deadwood; been in Deadwood three years. I guess I know a quartz specimen from a chunk of salt. Jine us?" With the desire of ascertaining more, the reporter "jined." The nephew seemed ashamed of himself, but after warming up under the insinuating influence of an alcohol straight and the derision of his uncle, he told the story of his purchase. His name is Charles Hanson. He arrived here two days ago to meet his uncle, James Hanson. The uncle did not arrive from the Black Hills until last night. Meanwhile Mr. Hanson, Jr., had piloted about the city as best he could in quest of means wherewith to while away the hours of waiting. Tuesday night he dropped in at the Palace theatre on Blake street, and while investigating the mysteries of the boxes there, quite accidentally like made the acquaintance of two genial young bloods, who claim to be from San Juan, and stated they were out on a lark. He was not averse to having some fun himself, and together with the two spent the evening in taking in the resorts of pleasure and quiet. Now that he thought of it, he acknowledged that he had to foot most of the bills. Each of his new-found friends had a large black quartz nugget of gold, which they said had been given them by Judge Bowen as specimens, from his Summit mine. They were beautiful specimens, he thought, and from his limited knowledge of gold and gold quartz, be judged they each contained at least $50 worth of the precious metal. As the trio were bringing the festivities of the night to a close, one of the alleged San Juan boys apologised for the fact that they were not overstocked with money, and suggested that if Mr. Hanson would accompany them to a faro bank, one of the nuggets might be given as collateral for enough to play with. He was tired and sleepy, though, and declined. Yesterday afternoon one of the San Juanites, so-called, met him on Larimer street, and after a pleasant recounting of the former night's experience, confessed that he was broke and would sell his nugget at a discount. As much out of sympathy for his friend's condition as anything else, Mr. Hanson took the nugget and paid all that was asked therefor, the sum stated. He showed it to his uncle with the result known. "Now I'll prove that you were swindled," said Mr. Hanson, Sr., taking the nugget from the nephew and leading the way to McMorran's drug store. Purchasing a small vial of acid he poured it all over the specimen, the supposed gold sizzling and turning as green as a fresh-landed lobster. "I told you so; it's the same old trick. I've seen lots of the boys caught by it in the Hills. The specimen was excellently gotten up, being a perfect imitation of the Bowen specimens before having been submitted to the lapidary polish. The pores and interstices of the brown quartz were all filled with what people would have sworn was the pure quill." "How is the trick done?" asked the reporter. "Simply enough! The sharpers take a chunk of quartz, dip it into glue, and then blow brass fillings into the pores until they refuse to hold more. Then they roll it in the dirt to make the deception complete."—*Denver Tribune.*

CARON DE BEAUMARCHAIS.

The following occurrence took place on a fine day in the month of July, 1750, in the city of Paris:

Mr. Caron, an honorable, modest watchmaker, living in the St. Denis St., drove his only son and heir-apparent, Pierre Augustin, out of the house.

And he had good reasons.

The young gentlemen, who, since his thirteenth year had been an apprentice of his father, and counted upon as following in his footsteps, could by no means be held up as a pattern of a diligent horologist and orderly citizen. He was far from being ignorant; on the contrary, he was too smart; he lacked likewise not in accomplishments—in fact, he possessed too many—so many that his father grew desperate. The young man, for instance, rather played music than wrestled with the intricacies of depthing; and worse than all, he exhibited a talent for committing all manner of frivolous jokes, which, in an honest citizen's boy, were entirely out of place.

Father Caron, however, was no strong-hearted parent; he loved all his six children, his scapegrace son the most; he therefore, was willing enough after a lapse of a fortnight, when his passion had cooled, and at the intercession of all the paternal and maternal uncles and aunts, to receive the scamp again into his house —*provided, however*, he was willing to submit to the following conditions:

First, to dispose of nothing of his, the father's things, without due permission—not even an old watch key.

Second, to rise in the summer at six and in winter at seven, and to labor until supper, in order to honor his calling.

Third, feast and Sundays excepted, to eat nothing outside of the paternal house, and to be back by nine o'clock on these exceptional days.

Fourth, to quit that unhappy music; or at most to play violin or flute only in the evenings after work.

Fifth, not to go out without leave, and to invent no bad excuses therefor.

Sixth, to be satisfied with free board and eighteen livres per month, and to liquidate his indebtedness gradually from this sum.

The young Caron did not even attempt to soften the vigor of these, to him, very harsh conditions. He subscribed them obediently, full of repentance, and again entered into the house and business of his father. He began suddenly to develop a peculiar zeal for horology. In order to show his father that he could be capable of becoming one of the foremost watchmakers of his time, he invented the pin escapement for watches. He incautiously confided his secret to a very famous watchmaker in Paris, by the name of Lepaute, who misused the confidence so far as to proclaim himself openly as being the inventor of the escapement. But Caron was not the man to quietly let his right be usurped in this manner. He proceeded publicly against Lepaute, claimed the invention solely for himself, and demanded the arbitration of the Academy. This scientific body, in-

Our stock for the coming season will be found well assorted with all Staple Goods, and also with the Novelties as they are brought into the market.

As usual our prices will be low and terms liberal.

23 Scott Street, Toronto.

deed declared, on the 4th of March, 1754, young Caron to be the sole rightful inventor.

This was the first process of the man, who afterward, as Monsieur de Beaumarchais, was destined to interest the entire cultivated world in his processes. This case had made the name of the watchmaker, Caron Son, well known in Paris, and the consequence was that the King Louis XV., ordered a watch made by him. By means of his inventions published to the four corners of the earth by the interesting law suit, the young watchmaker was enabled to make the watches as diminutive of size as demanded. The joy of the King at the handsome and excellent timekeeper constructed byCaron was so great, that he invested him with the title of "Furnisher to the Court." Madame de Pompadour ordered a similar one, and Caron in person handed it to the all-powerful *amie* of the monarch. The watch was so small that it was mounted in a finger ring; it was 4½ lines in diameter, and not thicker than two-thirds of a line. It was wound by a new and very ingenious contrivance, and ran thirty hours with great exactness.

Caron had opened his path. The princes and princesses all ordered watches of the same Lilliputian pattern, and their young producer always carried it himself to the place of Versalies and handed it to the purchaser, because, of course, everyone wanted explanations concerning the thing, especially the ladies. The King favored him greatly, and even received him personally. The favorite wrote the following letter is 1754 to a relative in London. "I have finally delivered the watch to the King, who did me the honor of recognizing me, and remembering my name. His Majesty ordered me to wind it, and to explain it to all the gentlemen of the *Lever*. Never has the King received an artist with so much kindness; he desired information about every part of the movement. I lauded the magnifying glass at this opportunity, the one you presented me with, and it was universally admired. The King used it to inspect the ring watch of Madame de Pompadour. He demanded one like it for himself, on which I am engaged at present. All the gentlemen of the Court follow the example of the King, and each one desires to have his watch first. I bave also constructed a remarkable little pendulum for Madame Victoria (one of the daughters of the King). It has two hands, and from whatever side it is viewed it indicates the time."

If all this attests the skill of young Caron as horologist, his personal attractiveness, and even his faults, were calculated to pave his fortune in a manner little suspected. A still young wife of a Court official, who also had ordered a watch by him, took so lively an interest in the tall and shapely young man with the *spirituelle* face, that she influenced her husband to surrender to him his office, by paying a certain pension. This was nothing uncommon at that time, and the King patented the office to Caron, who stood in his special favor, as well as that of Madame de Pompadour and his daughters. From this day forward—November 9, 1755, when not yet 24 years old, young Caron left the store of his father in the Rue St. Denis, hung horology on a nail, and played the roll of courtier in the palace of Versailles, with a self-esteem of his actual value that was not by any means circumscribed by too great a modesty.

And, indeed, he moved upon the beeswax flooring of the palace as if he had been to the "manor born." He had become acquainted with the daughters of Louis XV. by means of his watches. They were four old maids, with the remnants of a convent education, who lived in great retirement in the palace, and suffered much with ennui. They passed their time as well as they could, and their strict rules permitted; one played several instruments, the other painted, the third studied languages, and the fourth took an interest in the mathematical and mechanical arts, and at times essayed to be a watchmaker. They gave a musical soiree once a week, at which also the King, the Dauphin and various other princesses were wont to attend. When they learned that Monsieur Caron also performed upon several instruments, and was especially expert upon the harp, he was invited to perform before them. The harp, little known until then in French society, was just beginning to grow into favor. The young harpist delighted the old ladies, and understood how to make himself so amiable with all of them that he was regularly invited to assist in these concerts, and to assume the role of bandmaster. He also instructed the royal daughters upon the instrument.

The awakening ambition of Caron, since such favors were showered upon him, aimed with single calculation for higher objects which he wished to obtain in the court world open before him. The old gentleman whose office he had purchased, died, leaving his youthful wife a widow, and she consented to become the wife of Caron. This gave him not alone wealth, but also another name, which threw around him a halo of nobility, even if only by the effrontery of its inventor. Because if the son of the humble Caron, from the Rue St. Denis, henceforward styled himself Caron de Beaumarchais, he simply added the cognomen upon the strength of an estate which his spouse had possessed formerly, either as a thing real or imaginary. Enough, the Court of Versailles counted one noblemen more—Caron de Beaumarchais, of whose patents of nobility no one knew anything definite.

It is not to be supposed that such a bold character lacked jealous and envious enemies. But he possessed spirit and wit, together with courage and confidence to break a lance with them morally and physically. He fought a duel with a nobleman and killed him. This added not a little in making him respected. With malicious verses and quick repartees, he understood how to be respected.

A cavelier had undertaken once, when he returned through the ante-chamber, coming from the boudoir of the royal ladies, to ridicule him in the presence of the courtiers.

"Monsieur," he addressed him, and held out a costly watch, "you understand something about watchmaking. Would you be so very kind, I pray, as to look at mine; it is in disorder."

"Monsieur," Beaumarchais responded, "since I have ceased to be occupied with watchmaking, I have become very unskilful."

"O, do not refuse me this favor."

"Be it so; but I reiterate that I have become very unskilful."

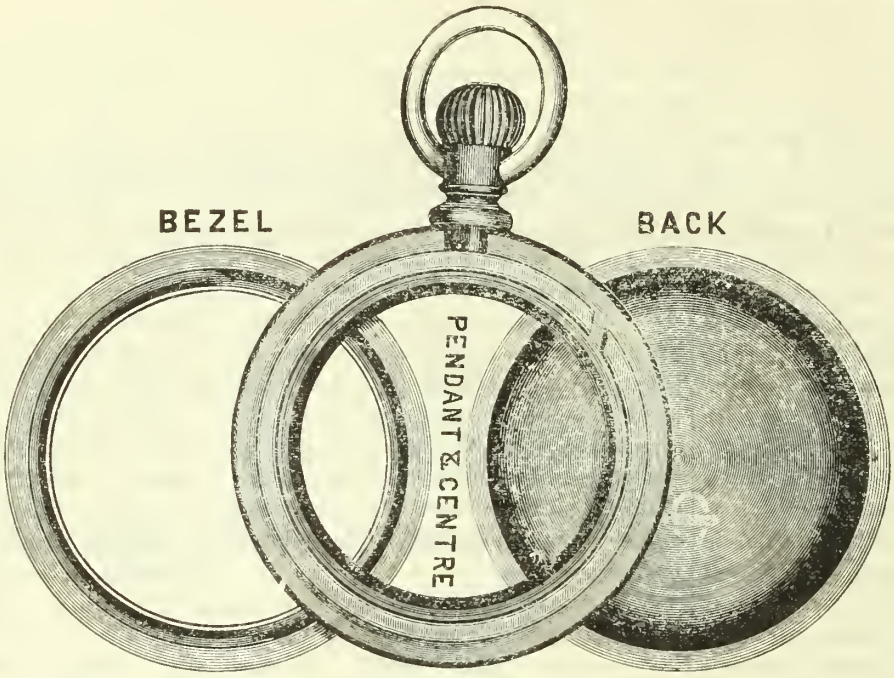
He took the watch, opened it, lifted it up high as if examining it closely, and let it drop.

Deeply bowing, he turned to the cavelier saying:

"I cautioned you that I had become very unskilful."

And he left the apartment while the duped nobleman collected the pieces of his timepiece.

At another time, Beaumarchais heard that evil-minded persons had prejudiced the princesses, by telling them that he stood in unfilial relations with his father. He therefore went to Paris, visited his father in the watchmaker's shop, and



The "Excelsior" Patent Dust Proof Case.

PATENTED,

United States,

27th December,

1881.

PATENTED,

Dom. of Canada

28th February,

1882.

This is the first and only case made without one grain of solder. Every piece is cut from the solid metal and pressed into the shape used in the case. This process hardens the gold and silver by the only method known (that is to work it), and is handed to the Trade as hard as is possible to make it, being a great advantage over a case made in the ordinary way, in saving gold and silver by making a case as strong as a much heavier one that has been softened as heat does in soldering on pendant, joints, thumb catches, or joint to swing movement in. Heat not only softens the gold or silver, but warps it out of the shape that the snaps have been fitted to, and it is never perfect after soldering. The Excelsior Patent Dust Proof is never soldered, never heated, is fitted perfectly, and remains perfect. The Excelsior Dust Proof has no joints to wear out or break off. The Excelsior Patent Dust Proof has no spring to break or wear the case. There is no part of the Excelsior Patent Dust Proof that will wear. The Excelsior Patent Dust Proof is the safest case made for protecting the movement—it will never open in the pocket Put an Excelsior Dust Proof in your pocket, bend forward, backward, put yourself in any position you please and the Excelsior is closed tight. In an ordinary case, with springs, by bending forward the case will often open and when the lock-spring is worn, the case is nearly always open.

The Excelsior Patent Dust Proof Case is the strongest, best fitting and most durable case made. Ask your Jobber for the Excelsior Patent Dust Proof. Every case warranted as stamped, 18 kt., 14 kt., 12 kt., 10 kt., United States Mint Assay or Coin Silver, as may be stamped, and every genuine case bears the Trade Mark. The Excelsior Patent Dust Proof Case may be obtained from any of the jobbing houses in the country.

TRADE MARK.

Instructions to Open the Excelsior Patent Dust Proof Case.

First press the crown as in opening an ordinary Hunting Cased Watch, then to open front, turn bow to the right with thumb and finger; to open the back, turn left. To close, turn case back in same position as when case was closed, and snap same as glass bezel on any watch.

under pretexts persuaded him to accompany him to Versailles. He was extremely careful to meet the princesses several times during the drive. He went to see them in the evening and was received very coolly, but was asked, as he had expected, with whom he had been driving.

"With my father," he responded.

Great astonishment; explanations followed, and Beaumarchais begged the honor of presenting his father who was in the ante-chamber. The old gentleman was admitted, and with paternal pride he sounded the praises of his son. In fact the honest citizen who had expelled his scapegrace son, had learned to hold him in high esteem, and was ready enough to proclaim it. And his son gave him an opportunity soon after.

In order to obtain a patent for nobility, he had, for 85,000 frs., purchased the titular position of Secretary to the King. There was only one obstacle, his father still pursued the business of watchmaker, a vocation incompatible with the high pretensions of his son. Wherefore he persuaded him by letter to retire, and bound himself to honorably support him and his sisters. The father in order not to thwart the aspirations of his son, acceeded, the latter obtained his patent, and the former lived afterward, in company with his four unmarried daughters, as *rentier*, amply supported by the munificence of his son.

We cannot part from so interesting a member of the horological fraternity without following his fortunes, the more so, since he was destined to play a large part in the future events of France.

Beaumarchais, a favorite of fortune in everything he undertook, in his new relation engaged in the sale of arms to America, and other speculations, and soon became a very rich man. Three law suits made him known everywhere, and two theatre pieces raised him to the rank of the most celebrated of French authors. His lawsuits, which he conducted against a high functionary, obtained their great popularity because Beaumarchais skilfully defended himself, and with it, all the rights of citizens heretofore wronged by justice.

In them, he attacked the ancient effete order, the defended and ossified right, the corruption of the administration, the preferences of the higher ranks. The great minds were impelling France to that immense revolution, destined to change the face of the entire civilized world, and Beaumarchais shook with vigor and energy, in his law documents on the decayed pillars of the temple of justice, the tumbling down of which speedily followed thereby. What he termed Memoirs, in which he recounted in a masterly manner his disputes, were illustrious pamphlets against the government, which long ago had became odious to the people. Beaumarchais published them, and his lawsuits became themes of national interest. They exerted such a power that the German poet Goethe dramatized it, and personified M. de Beaumarchais in his drama "Clavigo."

His two theatre pieces scarcely earned him less fame. "The Marriage of Figaro," and the "Barber of Seville," are known to everyone.

The "Marriage of Figaro," was first played in Paris in 1784, and its success was simply immense. Not on account of its special beauties, but of its wit and poetical proclivities. In Figaro, the merry Barber, the everywhere felt democratic idea was reduced for the first time; this servant of the Count Almaviva represented the third estate, the citizenship, which was still regarded as subject by both the nobility and the government, and as inferior in rights, but which was already in ferment, caused by this political and social inferiority. Everything he felt was expressed in this pert and witty Figaro, and laughers were not wanting even in the highest circles. This established before the whole world the moral right of these attacks upon the privileges of the nobility and the principles of social equality were thus sanctioned. The saying of Figaro, were secret thoughts of the people, and silenced all those against whom it was aimed.

The infirmities of existing society were laid bare at once, as if the last shred of deception had been dropped. All ancient authorities, the existence of which, simply because they were things handed down from the past, was still sanctioned and commanded respect, could be seen tumbling together in a miserable manner, and became a laughing stock, whereby their respect was lost forever. If there was a rotten concern, Beaumarchais aimed a shaft of derision thereat, and it never failed its mark. Before this, letters had been written lacking signatures, he affixed them. He was another Aristophenes, who pointed with his finger at what he assailed, and at the same time he had been a successful aspirant for that nobility himself.

It is remarkable that this piece, which the French government critic would not permit, was performed at the special command of Marie Antoinette. Beaumarchais was greatly liked by her, as well as by the King, and both did naturally not dream that they were loading a cannon with Figaro the charge of which should hit themselves. The rights of the nobilty to all the preferments in the State could not be derided better than by the words of Figaro, "because he had taken the trouble to be born."

Beaumarchais was the witty genius who predicted the Revolution as an inevitable fact. When it entered into the arena of history with an earnest face, and finally played its tragical part, carried away by passion, a genius like that of "Figaro's Marriage," was of no further consequence. He whose works had struck such heavy blows at the old regime, could not escape the Nemisis; to fall with it, as it had carried him upward. In the year 1784, he was the most honored man in France, rich, popular with the citizens, feared by the nobility, and his piece was performed 72 times in succession, calling forth an ever-increasing applause from the public, until he himself said: "There is only one madder thing than my piece, and that is its success."

Fifteen years afterward, at the end of the century, the same Beaumarchais died almost unknown, and impoverished, after having been proclaimed the enemy of the people, and barely escaped with his life.—*Jewelers' Circular.*

THE WAY TO WEALTH.

From Poor Richard's Almanac.

We are pleased to present to our readers a reprint of the celebrated maxims and apothegms of Benjamin Franklin, printed in his almanac, which bore the feigned name of Richard Saunders, and hence acquired the title of "Poor Richard's Almanac." Its publication began in the year 1732, and continued twenty-five years. When it was brought to a close a collection of the maxims was published in the last number in an address to the readers, entitled "The Way to Wealth." The admirable digest has been translated into various languages, and is widely known. We reproduce it herewith as follows:—

SIMPSON, HALL, MILLER & CO.,

WALLINGFORD, CONN.

—MANUFACTURERS OF—

Artistic and Useful Hollow Ware,

ELECTRO PLATED UPON FINE HARD WHITE METAL.

There is nothing in Designing, Ornamentation or Manufacturing which our artists and workmen cannot produce.

Wallingford, Conn.

No connection with any concern in Waterbury, Meriden or Hartford, using name of Rogers in any form.

FACTORIES: WALLINGFORD, CONN., U.S. AND MONTREAL, CANADA.

THE WAY TO WEALTH.

I stopped my horse lately where a great number of people were collected at an auction of merchants' goods. The hour of sale not being come, they were conversing on the badness of the times; and one of the company called to a plain, clean old man, with white locks, "Pray, Father Abraham, what think ye of the times? Won't these heavy taxes quite ruin the country? How shall we ever be able to pay them? What would you advise us to?" Father Abraham stood up and replied, "If youll have my advice, I'll give it to you in short: 'for a word to the wise is enough: and many words won't fill a bushel,' as poor Richard says." They joined in desiring him to speak his mind; and gathering round him he proceeded as follows:—

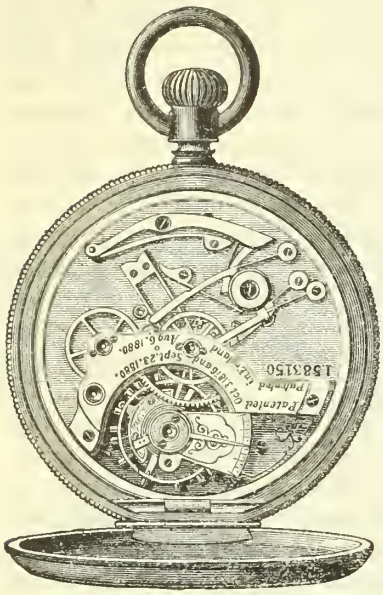
"Friends (says he) and neighbors, the taxes are indeed very heavy; and if those laid on by the government were the only ones we had to pay, we might more easily discharge them; but we have many others, and much more grievous to some of us. We are taxed twice as much by our idleness, three times as much by our pride, and four times as much by our folly; and from these taxes the commissioners cannot ease or deliver us by allowing an abatement. However, let us hearken to good advice, and something may be done for us: 'God helps them that help themselves, as poor Richard says in his Almanac.

"It would be thought a hard government that should tax its people one-tenth part of their time, to be employed in its service; but idleness taxes many of us much more, if we reckon all that is spent in absolute sloth, or doing of nothing, with that which is spent in idle employments, or amusements that amount to nothing. Sloth, by bringing on diseases, absolutely shortens life. 'Sloth, like rust, consumes faster than labor wears; while the key often used is always bright,' as poor Richard says. 'But dost thou love life? then do not squander time, for that's the stuff life is made of,' as poor Richard says. How much more than is necessary do we spend in sleep! forgetting that the sleeping fox catches no poultry, and that there will be sleeping enough in the grave,' as poor Richard says. If time be of all things the most precious, wasting time must be (as poor Richard says) the greatest prodigality;' since, as he elsewhere tells us, 'Lost time is never found again; and what we call time enough, always proves little enough.' Let us then up and be doing, and doing to the purpose; so by diligence shall we do more with less perplexity. 'Sloth makes all things difficult, but industry all easy,' as poor Richard says; and 'He that riseth late must trot all day, and shall scarce overtake his business at night; while laziness travels so slowly that poverty soon overtakes him,' as we read in poor Richard; who adds, 'Drive thy business; let not that drive thee;' and,

'Early to bed and early to rise
Makes a man healthy, wealthy, and wise.'

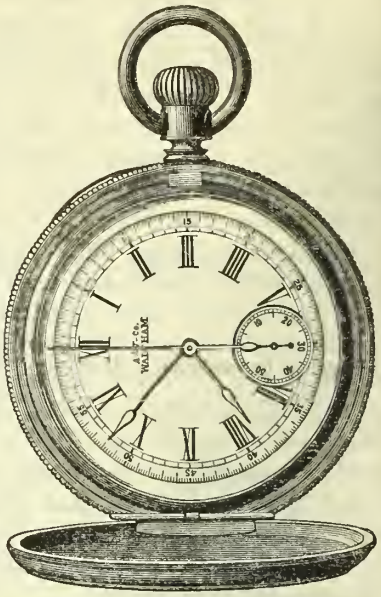
"So what signifies wishing and hoping for better times? We make these times better if we bestir ourselves. 'Industry needs not wish,' as poor Richard says; 'He that lives upon hope will die fasting.' 'There are no gains without pains; then help, hands, for I have no lands: or if I have, they are smartly taxed;' and (as poor Richard likewise observes) 'He that hath a trade hath an estate, and he that hath a calling hath an office of profit and honor;' but then the trade must be worked at, and the calling well followed, or neither the estate nor the office will enable us to pay our taxes. If we are industrious, we shall never starve; for as poor Richard says 'At the working-man's house hunger looks in, but dares not enter.' Nor will the bailiff or the constable enter; for 'Industry pays debts, but despair increaseth them,' says poor Richard. What though you have found no treasure, nor has any rich relation left you a legacy? 'Diligence is the mother of good luck,' as poor Richard says: and 'God gives all things to industry: then plow deep while sluggards sleep, and you will have corn to sell and to keep,' says poor Dick. Work while it is called to-day; for you know not how much you may be hindered to-morrow; which makes poor Richard say, 'One to-day is worth two to-morrows;' and further, 'Have you somewhat to do to-morrow, do it to-day.' 'If you were a servant, would you not be ashamed that a good master should catch you idle? Are you, then, your own master? be ashamed to catch yourself idle,' as poor Dick says. When there is so much to be done for yourself, your family, and your gracious king, be up by peep of day; 'Let not the sun look down, and say, Inglorious here he lies!' Handle your tools without mittens; remember that 'The cat in gloves catches no mice,' as poor Richard says. It is true, there is much to be done, and perhaps you are weak-handed; but stick to it steadily and you will see great effects; for continual dropping wears away stones, and by diligence and patience the mouse ate into the cable; and 'light strokes fell great oaks,' as poor Richard says in his Almanac, the year I cannot just now remember.

"Methinks I hear some of you say, 'Must a man afford himself no leisure?' —I will tell thee, my friend, what poor Richard says. 'Employ thy time well if thou meanest to gain leisure; and since thou are not sure of a minute, throw not away an hour.' Leisure is time for doing something useful; this leisure the diligent man will obtain, but the lazy man never; so that as poor Richard says, 'A life of leisure and a life of laziness are two things.' Do you imagine that sloth will afford you more comfort than labor? No; for as poor Richard says, 'Troubles spring from idleness, and grievous toils from needless ease: many without labor would live by their own wits only, but they break for want of stock.' Whereas industry gives comfort, and plenty, and respect. 'Fly pleasures, and they'll follow you; the diligent spinner has a large shift; and now I have a sheep and a cow, everybody bids me good-morrow:' all which is well said by poor Richard.



(*To be Concluded next Month.*)

BUSINESS CHANGES FOR JANUARY.



Samson & Swanson, Blenheim, Hardware, dissolved, W. D. Samson continues alone; A. E. Morris & Co., Toronto, Jewelry, style now Levetus Morris & Co.; J. Kennedy & Co., Guelph, Jewelers, selling off by auction; John Crow, Hamilton, Jeweler, sheriff in possession; J. L. Martineau & Fils, Quebec, Hardware, has called meeting of his creditors; Hutchinson & Co., St. Johns N.B., Jewelry, store closed; John Woodward, Port Rowan, Hardware, selling out; Miller, Morse & Co., Hardware, Winnipeg, admitted F. M. Morse into the firm: John Swindles, Jeweler, Hamilton, skedaddled.

BUSINESS NOTES.

D. Haist, a tinsmith, of Walkerton, left suddenly the other night for parts unknown, but before doing so made an assignment to John Klein.

THE NEW WALTHAM WATCH CHRONOGRAPH.

The Best Watch now in the Market for General Use.

SOLD IN GOLD CASES ONLY.

Fourteen and Eighteen Carat Fine. Quality Stamped and GUARANTEED by the Company.

This watch is of medium size, and made to indicate and register the fifth second.

By new inventions and the application of American Machinery, THE AMERICAN WATCH CO. has so simplified the manufacture of these Watches as to greatly reduce their cost, and they can now be obtained at prices which make them the MOST DESIRABLE time-piece for all classes of watch wearers.

FOR ✢ SALE ✢ BY ✢ ALL ✢ FIRST-CLASS ✢ JEWELLERS

AMERICAN WATCH CO.,

ROBBINS & APPLETON, General Agents,

NEW YORK.

The Hamilton Powder Company, Montreal, has acquired the building now being erected on Bell's Island, Kingston, for the manufacture of dynamite. There is a great demand for this explosive and dualin at mines along the line of the Kingston & Pembroke Railway.

Mr. Franklin J. Laidlaw, for many years in the employ of the late Robt. Wilkes, and lately travelling for his successors, was last Thursday evening presented by his fellow-employees, with a gold Albert chain and locket, together with an address expressive of regret at Mr. Laidlaw leaving the employ of the firm.

A Young Canadian named Aylmer Samis was arrested on the 5th of January at Detroit for smuggling five watches. He pleaded guilty and was taken to gaol to await disposition by Judge Brown. Samis formerly lived in Port Hope and Newcastle. He has been in Detroit only a few weeks. Still the work goes on, and still we wonder at crime.

Mr. J. A. Watts, the well known and popular manager of the Toronto Silver Plate Co., has just returned from a visit to the United States, where he succeeded in securing the services of some of the best workmen in the electroplate trade. The Company will now prosecute vigorously the manufacture of the newest designs of Hollow Ware, and expect shortly to turn out an assortment of goods that will be a credit to Canada.

A New Telephone.—Mr. R. Gray, agent of the Grand Trunk Railway at Acton, has invented and patented a new telephone. The instrument has been in successful operation over a three mile circuit at Acton for some time, and although it has received no greater test so far its utility for this distance leaves no doubt as to the possibility of its successful operation over longer stretches. The chief feature of the new telephone is that you can hear a message in an office without putting your ear to the instrument, and that it does away with the necessity of using a bell to call the person up with whom you wish to speak.

The Hardware firm of J. L. Martineau et fils Quebec, has issued a circular to its creditors calling a meeting when a statement will be submitted. As far as we can learn from outside sources their liabilities will probably amount to about $25,000, due principally in Montreal. The assets are understood to be largely composed of outstanding accounts among poor blacksmiths in the Saguenay district. The concern, while claiming a considerable nominal surplus, has been in a troubled condition for a long time past. A failure is recorded against them in 1871, on which occasion they settled at twelve and six pence in the pound.

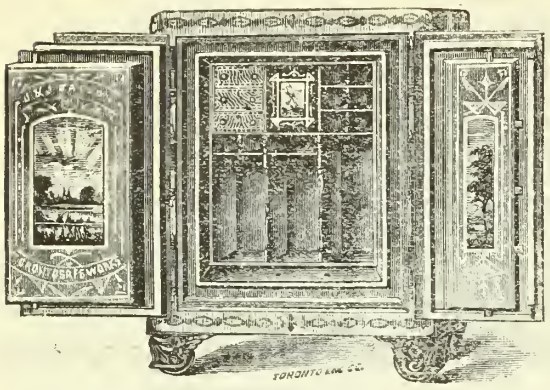
Mr. John Crow for some time has kept a small jewelry store on York Street, Hamilton. He went to that city about eighteen months ago, soon starting business with a capital about $1,000. On Tuesday, 2nd inst, he gave his wife some money and told her he was going to Toronto and would return the next day. He has not been seen in the city since. Deputy Sheriff Gibson is in charge of the stock for Mr. Crow's creditors, whose claims amount to about $2,000; assets about $700. Mrs. Crow states that she thought he was getting along well and had no idea he was going away. She is left in somewhat straightened circumstances, with an infant.

Montague Banks carried on the drug business in Winnipeg for several years and made an awkward failure. Then he became a clerk. About a year ago he bought a small grocery and liquor business and opened in his wife's name. Now she has assigned, with liabilities of about $8,000 and nominal assets of $5,000 or $6,000. Montague had not much business capacity, and could not reasonably expect to make money without it in a wide-awake city like Winnipeg. This is only another illustration of the folly of people who have not capacity rushing into business. "Oh! Montague, Montague, what would your mother say if she could see you now."

The latest proposed method of ensnaring "the enterprising burglar" throws door-pistols, electric bells, and all previous burglar alarm apparatus completely into the shade. Electric pins imbedded in window sills and door-steps did their work, but overdid it by alarming the burglar oftener than the household, and have consequently, fallen into disfavor. According to the new plan, the electric buttons will be preserved as before, but the current instead of starting an alarm will turn on the full glare of an electric light, and at the same time expose a plate in a camera all in readiness to receive an instantaneous picture of the party "occupied in crime." The scheme is novel and ingenious, and would be useful if photographs of an unmasked man could be counted on In the meantime it is better to be warned of the presence of a burglar than to have ever so good a picture of a felonious person effectually disguised.

John Swindle, jeweler, Hamilton, Ont., levanted a few days ago, leaving a lot of creditors to mourn his departure. Developments go to show that he did business largely with the pawnbrokers. At the different pawn-shops some eighteen watches, gold and silver, have been seized by Detective Mackenzie. They were pawned for a total sum of $223. The real value of the watches would not be less than $1,000. Many of the watches have been claimed by their owners. This Swindle swindler, is a good example of a class that are becoming common in America, simply because credit is too cheap, and wholesale houses have themselves to blame for crediting such irresponsible people. If wholesale dealers always insisted upon such men paying cash until they get their credit established, we would hear of fewer rogeries of this kind. His creditors should hunt for this fellow until they find, him and put him through as far as the law will allow. An example made of such people now and again might act as a deterrant against such practices.

Most jewelers find it hard enough to put their advertisements into prose, let alone into rhyme, but this does not seem to be the case with our friend W. J. Douglas, jeweler, of Pembroke, Ont. For his holiday advertising he mounts his Pegasian steed and soars aloft on the wings of verse away over the heads of his competitors. We trust his Christmas trade was as good as his verses, and that he may ever be able truthfully to sing



"Thus wags the world, success begets
Envy and malice, and oft sets
Slander in motion, anger whets,
But Douglas.

Onward, regardless, keeps his way,
Lets friends and foes have their say,
He sticks to business makes it pay,
Does Douglas.

Another of the best known business men in Montreal, Mr. Horatio A. Nelson, has passed away. Born in New Hampshire in 1816, Mr. Nelson went to Montreal in the year 1840, where he began business in the firm of Nelson & Butters. In 1861 the firm became Nelson & Wood, and in 1874, the four sons of the deceased being admitted partners, the firm became H. A. Nelson & Sons. A prudent and methodical man, Mr. Nelson built up an extensive business, and what is more, earned an enduring name for fair dealing, which his sons and successors in two cities well maintain. In the City Council of Montreal the deceased gentleman served his fellow-citizens faithfully and well, holding for years the position of chairman of the Finance committee. In Quebec Legislature he spent three or four years; as president of the Montreal Loan & Investment Association, director in Molsons Bank and other corporations his judgment was valued; while in works of temperance, charity and morality his influence was strong on the side of right. It was not alone in church circles that he received and merited the affectionate title of "Father Nelson;" he has been father, helper, counsellor, to many. In his death the city of Montreal losses a diligent, conscientious and public spirited citizen.

Death of an old and Highly Respected Jeweler.—We are sorry to have to chronicle the death of Mr. Henry Davis, the well-known jeweler of London, Ont. Mr. Davis had been engaged in the jewelry business in that city for nearly thirty years, and was well known throughout the trade as one of the best watchmakers in Canada. He leaves three sons engaged in the same business, one in London, who for several years past has managed the old business, and two in Toronto, who have built up a very successful trade under the style of Davis Bros.

By the death of Mr. James Michie, Toronto loses one of her foremost and most respected citizens. Mr. Michie was born in Strathdon, Aberdeenshire, Scotland, in 1828. At the age of eighteen he left his native town and country for Canada, and arriving in Toronto in 1846. On coming to Toronto he entered into the services of Alex. Ogilvie & Co., of which his uncle, the late George Michie, was partner. In 1853 the now well-known firm of Fulton, Michie & Co. was established, the late James Michie being the managing partner. This was the retail branch of the wholesale firm of A. Ogilvie & Co. About the same time as the business of Fulton, Michie & Co. was established, the present firm of George Michie & Co. was also started, James Michie being a partner. Probably no citizen of Toronto was better known and liked than Mr. Michie. He was the soul of honor, generous to a fault and liberal, though unostentatious in his munificent charities. He had a host of friends, not one single enemy, and his name will long be remembered in this city as that of one who, possessing immense riches, used them so well as to earn the good will instead of the envy of those who knew him. The many who had not the pleasure of his acquaintance will miss his genial face and well-known form from our streets, but to those who knew him but to love him, his death creates a gap that no one else can fill.

J. & J. TAYLOR,
TORONTO SAFE WORKS.

Patentees and sole manufacturers of Taylor's patent Fire-proof Safes with

Non-Conducting Steel Flange Doors.

ALSO MANUFACTURERS OF

Burglar Proof Safes, Vaults, Vault Doors, Bank Locks, Combination Locks, Prison Locks and all Kinds of Fire & Burglar-Proof Securities.

20 YEARS ESTABLISHED.

NOTICE.

We take this opportunity of thanking our numerous customers for the liberal share of patronage extended to us during the season of 1882, and also beg to announce that our Mr. Anderson has just returned from the American Markets, where he has been selecting the latest novelties. Our travellers will take pleasure in calling on the trade during February.

A. C. ANDERSON & CO., - - HAMILTON, ONT.

"EXCELSIOR"

PATENT DUST PROOF CASE.

TRADE 

MARK.

Zimmerman, McNaught & Lowe

Desire to inform the Trade that they have on hand a Large Stock of this new Dust-Proof Case, which is

UNQUESTIONABLY THE BEST AND CHEAPEST DUST PROOF CASE IN THE MARKET.

ALSO A COMPLETE STOCK OF

Boss' Patent Stiffened Gold Cases.

THE BEST GOLD-STIFFENED CASE MANUFACTURED, BOTH IN KEY & STEM-WINDERS.

WORKSHOP NOTES.

Engravers' Border Wax.—Beeswax, 1 part; pitch, 2 parts; tallow, 1 part; mix. Engravers' cement: Resin, 1 part; brick dust, 1 part; mix with heat.

Polishing Powder.—An excellent polishing powder for gold and silver consists of burnt and finely-pulverized rock alum, 5 parts, and levigated chalk, 1 part. Mix and apply with a dry brush.

Gum for Backing Labels.—Mix pure dextrine with boiling water until it assumes the consistency of ordinary mucilage. Apply with a full evenly-made camel's hair brush. The paper should not be too thin or unsized.

Tranferring Pictures, etc.—If you desire to transfer pictures from paper to wood, for re-engraving, soak the print in a saturated solution of alcohol and white caustic potash, to soften the ink, then transfer to the block under roller pressure.

Extracting Silver from Wastage.—Mix your refuse with an equal quantity of wood charcoal, place in a crucible, and heat to a bright red, and in a short time a silver button will be found at the bottom. Carbonate of soda is another good flux.

To Renew old Oil Paintings.—The blackened lights of old pictures may be instantly restored to their original hue by touching them with dentoxide of hydrogen, diluted by six or eight times its weight in water. The part must be afterwards washed with a clean sponge and water.

Metal Letters on Plate Glass.—It is often necessary to attach glass or metal letters to plate glass. Use the following binder: Copal varnish, 15 parts; drying oil, 5 parts; turpentine, 3 parts; oil of turpentine, 2 parts; liquefied glue, 5 parts. Melt in a water bath and add 10 parts slaked lime.

SCIENCE AND OTHER NOTES.

Silver coin was struck at the English mint last year to the value of $5,021,615. The profit to the Government was $469,110. Besides this coinage, the mint struck about $90,000 worth of bronze pieces. In 1881 worn coin of the nominal value of $1,600,000 was withdrawn from circulation. The recoinage of the light gold in circulation in England, computed at $250,000,000, cannot be deferred much longer, in the judgment of competent observers. Besides the expenses of recoinage, there will be found an actual deficit of precious metal of $3,250,000, if the process be undertaken.

To imitate old artistic productions made of solid silver, the ground work and hollow portions not subject to friction are covered with a blackish red earthy coat, the parts in relief remaining with a bright lead luster, mix a thin paste of finely pulverized plumbago with essence of turpentine, to which a small proportion of red ochre may be added to imitate the copper tinge of certain old silver ware; smear this all over the articles. After drying, gently rub with a soft brush, and the reliefs are set off by cleaning with a rag dipped in spirits of wine. Old silver is easily renewed and the brightness of the metal restored by a hot solution of caustic potash, cyanide of potassium, or benzole. To give the old silver tinge to small articles, such as buttons and rings, throw them into the above paste; rub in a bag with a large quantity of dry fir-wood sawdust until the desired shade is obtained.

The case of two clever English rogues, Fulton and Watson, came on for hearing in the city of Paris yesterday. It was they who last winter stole from a jeweler, Mme. Chauvet, in the Rue des Capucines, diamonds to the value of 230,000 francs. The robbery was perpetrated in the following daring fashion: A man, calling himself Caston, presented himself in Mme. Chauvet's shop and requested to be shown some diadem diamonds, necklaces, etc. His manners were so good, and his dress so elegantly correct in every respect, that the merchande had no hesitation in spreading before her customer her most valuable gems. Of these the swindler made a lavish choice, and asked Mme. Chauvet to place them in a small black hand-bag he had brought on purpose. In payment, the pretended Colonel offered a check on a foreign bank, which was refused. "Wait a moment," cried the blackleg. "I will get it changed at the bank and bring you the notes. Keep the hand-bag; I shall be back directly." So saying he disappeared. Almost immediatly he had left the shop a respectably-dressed woman entered and requested to be shown a certain ring in the shop window. While Mme. Chauvet was occupied in getting the ring, the "Colonel's" accomplice succeeded in adroitly substituting an absolutely similar hand-bag for the one left on the counter. This done, she quickly chose her ring and left. When evening came without her customer returning, Mme. Chauvet opened the bag—which she thought was the same one that "the Colonel" had left—and discovered that she had been robbed. When Fulton and Watson were arrested in Belgium for other diamond robberies, several stones stolen from Mme. Chauvet were in their posession. Fulton was yesterday sentenced to four years, and Watson, the pretended Colonel, to five years' imprisonment.—*London Standard, August 27.*

The Watchmaker, Jeweller and Silversmith,

A Monthly Illustrated Journal. Published in London.

The Representative Organ of the Watch, Jewellery and Kindred Trades in the United Kingdom.

It is full of original information and thorough practical instruction contributed by the leading writers on the various subjects connected with the above trades. The text is well illustrated by wood-cuts, and two supplements of artistic designs for jewellery, etc. accompany each number.

This important Trade Organ, now in its seventh year of publication is in the hands of every British Watchmaker, Jeweller and Silversmith, and is therefore a most valuable medium for manufacturers requiring publicity in Great Britain.

Our list of permanent contributors includes such names as: J. U. Poole, Richard Whittaker, Henry Ganney, Moritz Grassmann, J. Herrmann, E. J. Watherston, W. H. Singer, an ample guarantee for the sterling value of the journal. Subscription 5s. per annum.

Published by A. FISCHER, 11 Saint Bride Street, London, E. C., England.

THE WATCHMAKER And Metal Worker

Is the official Journal of the

Watchmakers and Jewellers,

of the North west,

CONTAINING 56 PAGES OF

Illustrations and Reading Matter.

Whose columns are replete with choice articles upon Horology, Watch-making and repairing, written for this Journal by practical and scientific men; also a large amount of general information of vital importance to the trade; also continued articles, or lessons in letter engraving, written by a celebrated engraver of this city. Subscription price, $1.50 per year. Single copy, 15 cents.

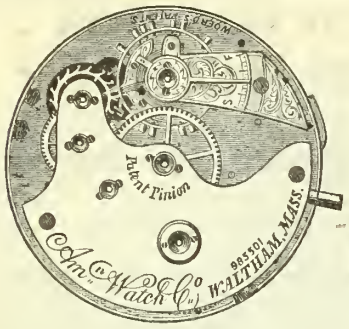
THE LARGEST

Clock House

IN CANADA.

I beg to direct the attention of the Trade to my large assortment of Clocks, from the following celebrated manufacturers, viz.:

SETH THOMAS, WELCH,
GILBERT AND ANSONIA,
INGRAHAM



I keep these Clocks in every style now manufactured, and show 200 different varieties of samples, besides Regulators of all kinds.

I will sell, only to the Trade, any of the above makes of American Clocks at prices lower than any house in Canada, and will guarantee to meet any competition either in quality, style or price. Also a large variety of Ladies and Gent's Swiss Watches, Gold, Silver and Nickel Cases, Key and Stem Winders.

STOCK TAKING.

Every merchant should take stock at least once in each year, and in addition to this he should also go carefully through his accounts and find out whether his trade has been a profitable one or the reverse.

Stock taking is not an enticing occupation. In fact, we think that most of our readers will agree with us that it is a dusty, tiresome, mean job; but as every good business man knows, it is a necessary evil, and one that should be faced manfully if a merchant wants to know enough about his business to deserve success.

The merchant who takes stock and balances his books regularly, has a long pull over his rival who never cares to bother about such things, and thinks them all a waste of time. He finds out for a certainty what goods have sold best, what have been stickers and therefore unprofitable, what lines it will pay him to cultivate and what to drop. He will also know more about his accounts, and be able to save money by a little judicious pressure on sundry long-winded or weak kneed customers, who, otherwise, would let him in for a loss or shove him off for another year.

One of the reasons why so many merchants fail is because they know little or nothing about their own business. They stumble along from year to year of their business career, but they can never tell you for certain whether they are solvent or insolvent. They never take stock, never balance their books, never do anything but blunder along in a hap-hazard sort of a way, and trust to that most fickle of all godesses "Fortune," or "luck" as they have it in vulgar parlance. Thus with the blind being led by the blind, is it any wonder that so many of them fall into the ditch of bankruptcy.

We have known merchants, who, when questioned about their financial position, assured their creditors that they were all right, and they knew they had a surplus.

We have known these very individuals inside of three months go into bankruptcy, and when their estate came to be investigated it could not show more than fifty cents on the dollar, even on paper, and probably not the half of that when brought under the hammer.

These men never took stock, they never investigated their accounts, they never balanced their books, books did we say, why they hardly knew what the term meant, they had an apology for a set of books, but they might about as well have had none for all the practical use they were to them.

They were a good deal worse than the Irishman we once heard of in an eastern Canadian city who took stock every year with great regularity on this principle: He would set all his clerks at work making an inventory of his goods, and when they had taken as much in amount as equalled his liabilities he would say to them: "Now then boys you've taken enough to pay the creditors, and all the rest is my own and ye can stop."

This was a primitive way of bookkeeping certainly, but it was far ahead of that of many who never know for certain that they have any margin above their liabilities to call their own. In fact some business men never know what their liabilities are until they are tabulated by the official assignee.

We cannot impress too strongly upon our readers the importance of an annual stock taking and straightning up of accounts. We know it is disagreeable work but is a necessity if one wants to succeed.

A GOOD ACT.

We are pleased to notice that Mr. Beaty, the member for West Toronto, has this session of Parliament taken time by the forelock, and has given notice of motion for his insolvent bill, entitled, "An act for the equitable distribution of insolvents' estates." We trust that Mr. Beaty will not allow his measure to be crowded out this session as it was last time, as it is an act that is demanded by the necessities of the times if we wish to preserve the status of commercial morality amongst our mercantile men.

We have often before stated that no one can find fault with the theory underlying all insolvent legislation, viz.: "that when a merchant becomes insolvent his estate should be divided *pro rata* amongst the whole of his creditors." Every one will admit that in theory this principle is correct, and it is only when we come to carry it practically into effect that we experience any difficulty or disagreement. The trouble seems heretofore to have been that our insolvent acts aimed at too much rather than too little, and in the multitude of provisions it became so cumbersome and expensive as to defeat its own ends.

What we want is a simple law for the distribution of an insolvent's estate, an act that shall force a trader to assign for the benefit of his creditors generally as soon as he becomes unable to meet his liabilities or can be proven to be insolvent, an act by which all debts against the insolvent's estate shall rank *pro rata*, whether current or matured; and one, moreover, that shall leave the disposition of the assets in the hands of the creditors themselves.

This last feature, which contains within it the element of cheapness, so necessary to any good insolvent law, is absolutely necessary to make any legislation of this kind successful. Hitherto under the old insolvent law the assignee had a percentage on the full amount of any estate, and by the time his percentage and other expenses were paid the creditors were in many cases left pretty badly. As a rule these assignees fattened at the expense of the creditors, and the estate could in nearly every case have been wound up equally well by the creditors themselves without his interference.

As a matter of equity the creditors own all the debtor's assets. What more common sense scheme could be inaugurated then than simply to let them do what they think fit with them. If they wish to give the estate back to the insolvent they can do so, if they decide to sell they can do so, even should they decide to distribute the goods themselves it is in

their province to do so; surely those who own an estate and are more interested than anyone else can possibly be in seeing it properly administered should be empowered to act as the circumstances seem to them to demand.

We think were the law framed upon such a basis as this, that more general satisfaction would be felt throughout the whole mercantile community, both wholesale and retail, than could possibly be if the winding up of estates were put into the hands of any officials, who either directly or indirectly had to make a living out of it. Merchants generally think they possess brains enough to run their own business, and we think this is about as much their own business as any other could well be, seeing that they own the whole concern.

As regards the insolvents themselves, whose rights have always to be considered in any such legislation, we think that if honest they would be safer in the hands of their creditors than in those of any government official, who could not possibly have as great an interest in seeing them make such a fair settlement as the creditor, who might, if things went on smoothly, afterward replace his loss by the profits of future transactions.

As a rule creditors are lenient with any debtor who fails through misfortune, and if he evinces any disposition to do right, he invariably receives a helping hand, and this would be more than ever the case were the creditors masters of the situation as we have suggested above.

We shall look forward with a good deal of interest to see the result of Mr. Beaty's attempt to remedy what is now an admitted evil, and we in common with many others wish him success.

THE DISCOUNT SALES HUMBUG AGAIN.

We had hoped that the discount sales humbug which for four or five years has, like some periodical epedemic, broken out just before the Christmas holidays, had become a thing of the past, but it seems we were mistaken in our estimate of the influence that common business prudence has in the direction of the affairs of some of our retail jewellers.

We have on more than one occasion attacked these discount sales and proved their folly or dishonesty, but in spite of these and many similar warnings, there are to be found dealers who are either charitable enough to give away thirty or forty per cent. of their profits, or dishonest enough to try and persuade a gullable public that they are doing so.

We have yet to learn that the dealers who were foolish enough to injure their own business and the trade generally by such a practice, have really received any benefit at all commensurate with the evil they have inflicted. We have even yet to learn that they succeeded in increasing their sales beyond that of their competitors who sold at net prices, or even beyond what they themselves would have done had they followed a similar course.

It is somewhat singular that the jewelry trade is almost the only one that is forced to sacrifice goods in this manner. With the exception of a few dry goods dealers who have been "going out of business" for the last twenty years and therefore offering their goods at their usual tremendous bargains, we are not now aware that any other trade is similarly afflicted.

The more we examine into this thing, the more we are convinced that the whole trouble arises from the greed or incapacity of those dealers practicing it, and not from any real necessity, either from the state of trade or the demands of the public.

People don't buy jewelry because it is cheap, for as a rule very few know whether an article of jewelery is cheap or dear at the price asked for it, and have to depend almost entirely upon the honesty and reputation of the seller. This being the case, it must be acknowledged that it is not because they know anything about its value that they buy jewelery at these discount sales. They fancy they are getting bargains, but in nine cases out of ten they are not, and this they will surely find out in the long run. The same thing explains why some retail jewelers prefer selling goods by auction to selling by regular private sale; they say the latter way is too slow, and that they can make fully as much if not more profit on cheap goods by auction.

The fact of the matter is that the public are easily gulled, but even this is no reason why the jewelry trade, which, beyond all other trades should be above even the breath of suspicion, should demean itself by coming down to the level of business sharpers. The jewelery business is peculiarly one of confidence, and it seems a pity that those engaged in it should of their own accord lay themselves deliberately out to ruin it. They may not think that these discount sale humbugs have such an effect, but if they will only take the trouble to look below the surface they will find that what we say is correct beyond the shadow of a doubt.

These discount sales may not be dishonest, but they verge so closely on it that many people not gifted with a superabundance of intelligence fail to comprehend the difference. Of course they ought to know better than this as it is only a sharp business practice, and humbug is now-a-day's considered legitimate if it be only successful, but in our estimation it is a practice that is detrimental to the best interests of the jewelery trade and one that should be discouraged by all jewelers who have the good of the trade and their own interests at heart. Our idea is that the only way a safe and paying business can be built up is to make a reputation for honesty and integrity by selling goods for what they really are and at their true value.

This method may be old-fashioned and behind the spirit of this fast, wide-awake age, but it is at least safe as well as having the merit of being honest. Any system of discount sale humbug and chicanery, although it may flourish for a season, is sure to come to grief in the long run, and we would strongly advise our readers to keep clear of all such and stick to the old-fashioned though slower and more honest system.

Selected Matter.

HONORS TO AN OLD TORONTO MAN.

On the 6th of January Messrs. Robbins & Appleton tendered a dinner to Donald Manson, their Australian representative, at the rooms of the Union League Club. Sumptuous as were these rooms, the tables were equally ornamented by elaborate dishes, composing a most tempting *menu*, to which the assembled guests did ample justice.

When the work of destruction was completed, Mr. Appleton, who presided, arose and addressed Mr. Manson, speaking eulogistically of the valuable services rendered to the American Watch Co. by that gentleman, and holding him up as an example to all for his devotion and loyalty to the cause of the American watch industry. He proposed the

health of Mr. Manson, and asked all to join him in wishing the guest of the evening a pleasant voyage out and success in all his undertakings.

Amid great applause Mr. Manson arose to thank the chairman for his expressions of kindly feeling and for the good wishes of all present, referring to the prejudice and opposition American watches had to encounter, especially in countries antagonistic to American enterprise. He said that the excellence of the watches made at Waltham was sufficiently eloquent to brush away every obstacle that beset their introduction into foreign lands, and on this characteristic element of Waltham watches he alone relied for public appreciation in the Australian market.

Congratulatory despatches were sent to Boston, where the foremen and officers of the Waltham Factory happened to be celebrating the completion of the 2,000,000th watch at a dinner at Young's Hotel, the day having been chosen to celebrate also Mr. R. E. Robbins' twenty-fifth anniversary of his assuming the office of Treasurer of the company. Telegrams were sent congratulating him upon the success he has achieved as the pioneer who made the American Watch Company the standard bearer of a new interest in America, an enterprise which, at the outset, employed only a small number of hands, but now affording a comfortable livlihood to more than two thousand men and women in Waltham alone. Many reminiscences of the early days of American watches were told, and thus pleasantly the evening was spent, until at a late hour the party separated under the merry notes of:

> "For he is a jolly good fellow,
> The which nobody can deny!"

—*Jewelers' Circular.*

CURIOUS.

An astronomer noticed that the steel parts of a very valuable clock were coated with rust, in spite of a most careful previous cleaning. Since no other instrument in the observatory exhibited a similar appearance, the cause was assigned to the case, and this submitted to a thorough examination. The front of the case consisted of mahogany and the back part of oak wood, while both were connected by copper braces. It was suspected that the oak wood exerted the injurious influence, wherefore the copper braces were unscrewed, and it was found that those parts passing through the mahogany were entirely lustrous, while the ends through the oak wood were covered with copper oxide. Small holes were bored into the wood, the chips, amounting to a small fraction of a gram, were heated in boiling water above a flame and litmus paper was dipped into it, which was at once reddened. Perfectly dry, stuffed for a few seconds into the holes, were strongly reddened after a few seconds. From this may be seen that the acid contained in oak wood is extremely volatile, and this wood is not whatever suitable for instrument casings.—*Exchange.*

FINE ART WORK.

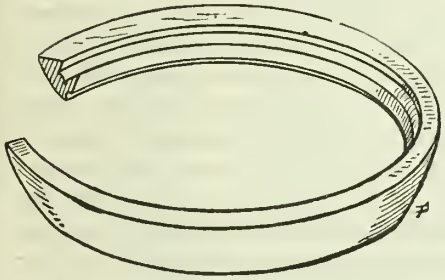
The Nuptial present of the Province Saxony for the Prince and Princess Wilhelm of Prussia, and which at the festival was only donated in design, has been finished. The central piece, a silver cup about one meter (39-37 inches), has been completed some time ago by the firm of Sy & Wagner. It was modeled by the sculptor Zacharias, and is surrounded by a border representing a marriage procession, embellished with exquisite figurative and ornamental adornments in relievo, gildings and settings of colored jewels, of an admirable effect. The three-story buffet, destined for receiving this *chef d'œuvre*, was carved out of walnut by a sculptor of Magdeburg, assisted by architect Schutz, and, of course, is ornamented in the highest style of wood carving; while paintings at either side of the main division lend an additional effect. They consist of two allegorical female figures, standing in half-round niches. They represent the two chief branches of the Province Saxony, mining and agriculture. The former has the hammer in the right hand, while the left raises the ray-encircled gems, with the mining lamp in the diadem; the other one rests a foot upon the plow, carrying a pigeon in the right hand, while embracing a cornucopia with the left arm. The long front of the Merzeburg Castle is painted in a lower compartment, and in the others, respectively, the domes of Magdeburg and Erfurt, with other representations also of local interest. The goldsmith's work is said to rival any of the productions of the famed middle age,—*Ex.*

CLASSIC STYLES IN JEWELRY.

We are indebted to Oscar Wilde for making the sunflower popular. The use of the topaz with the fine frosted gold gives us a good sunflower, while an amethyst does duty for a pansy, and pearls and topazes can be worked up for the daisy. The very white shade that silver can now be made to take is useful in making flowers into jewelry. There is no new way of setting diamonds except in flowers. The single stones of value are very simply mounted, silver being the best setting, and are worn close to the ear.

There is now an odd fancy about ear-rings. Two of a kind are no longer scrupulously held to be a pair, but odd stones are worn as a pair. You will see a pink pearl on one ear and a black one on the other, or you will see a diamond in one ear and a clear white pearl on the other. A Turkish grandee, who was in this country some years ago, commented upon the poverty of design in the ear-rings of American women. He said that the ear-rings, as a feature of personal decoration, did not seem to be appreciated; that the odalisques in the harems wore the most beautiful ear-rings of any women in the world, and that, what was better, they designed them, there being no more exquisite taste in jewelry than that of the Sultana. I know of no fortunes in odd ear-rings in New York, and if the fashion of Cleopatra's days is adopted, it is not likely that her extravagance in jewelry will be imitated, for the pair of ear-rings she wore before Antony is said to have cost over half a million dollars.--*Exchange.*

INGENIOUS ROBBERY OF DIAMONDS.



The details have transpired of a most daring and ingenious robbery of diamonds, valued at between £400 and £500, belonging to Messrs. Wellby, 18 and 20 Garrick Street, Convent Garden, and it is believed that with the capture of the thief further discoveries in relation to other jewel robberies will be brought to light. It appears that Mr. George Attenborough, who has recently removed his stock from his shop, now undergoing

A MUCH CLOSER FIT.

demolition, at the corner of Chancery lane, to his new premises at 71 Strand, was conversing one day with some customers, when a stranger hurriedly entered and asked whether any one of the name of Hamilton had come about the purchase of some jewelery. Mr. Attenborough turned to the newcomer, and, seeing he was quite unknown to him, asked the hour at which he was to meet Mr. Hamilton, and the nature of his business, to which questions he gave satisfactory replies, and, depositing his hat on the counter, he quitted the shop as if to give directions to the cabman who had driven him there. He was observed by an assistant to be in conversation outside with another man, who handed to him a small bag, with which he entered the shop, and stood near the door, as though waiting the arrival of his friend. No one, however, came, and presently he put on his hat and went away, saying he would return again shortly. No one of the name of Hamilton called, and nothing was seen of the visitor during during the rest of the day, and on Friday Mr. Attenborough asked his assistants whether they had heard or seen anything of their strange visitor. He was told that he had not returned, and a curious fact connected with his visit was that one of the assistants felt confident that the man he was talking to outside the show window was one of Messrs. Wellby's people. The whole circumstances were so strange, that a member of Mr. Attenborough's staff took an opportunity of calling at Messrs. Wellby's on Saturday morning, and during his visit he mentioned that he had seen one of their people outside Mr. Attenborough's premises on Thursday. "Why, of course you did," was the reply, "he took down the jewellery you sent for." "We have sent for no jewellery," said Mr. Attenborough's assistant, and immediately the nature of the fraud became apparent. It was afterwards discovered that on the day previous to the robbery a well-dressed man called at Messrs. Hancock, and stated that he came from Messrs. Attenborough, whose card he presented, and said they had just entered their new premises, and wished for some handsome jewellery for stock. Messrs. Hancock's manager replied that he thought it very odd that Mr. Attenborough should send to him, as he (Mr. Attenborough) could buy jewellery much more suited to him at Messrs. Wellby's with whom he knew Mr. Attenborough dealt; and he added: "You tell him so with my compliments." The next day the thief, fortified with Messrs. Hancock's advice, called on Messrs. Wellby, and stated that he was an assistant to Messrs. Attenborough, and had been sent for some expensive diamond ornaments to show a customer at their new shop on the Strand. The first observation was "Why, you are not one of Messrs. Attenborough's assistants." To which he replied: "I have been there for years; here is our card." And he again produced the card he had previously procured. Messrs. Wellby then allowed him to select £400 or £500 worth of brilliants handsomely set; and not being quite satisfied with his statement, sent one of their assistants with him in a cab to Mr. Attenborough's. The thief alighted first, and asking the young man to wait a moment while he spoke to Mr. Attenborough, he entered the shop as described above. The assistant of Messrs. Wellby paid off the cab, and was following the stranger into the shop when that person ran out without his hat, saying: "All right, the the customer happens to be there now. Give me the bag," He then took the bag and ran into the shop. Mr. Wellby's man, after looking through the glass and seeing the stranger inside with several of the regular assistants, became satisfied that all was right and walked away. So, it appears, did the thief, carrying the jewels with him. He is described by the attendants at Messrs. Wellby's as follows: Height, 5ft, 8in. or 5ft 9in.; oval face, pale; dark hair, inclined to be gray; whiskers and slight moustache and beard; age about 45; wearing black frock coat and silk hat. The stolen bracelet contained a single row of diamonds; one of the brooches was arranged in the shape of a leaf, the other in the form of a spray. The earrings were rather long and old-fashioned, of the description known as "drop-earrings."—*Pawnbrokers' Gazette.*

A CURIOUS CONSPIRACY.

At the instance of Hagstoz & Thorpe, proprietors of the Keystone Watch-case Manufactory, a capias was issued on Friday for the arrest of John C. Dueber, the chief owner of Dueber Watch-case Manufacturing Company, of Newport, Ky., and three of his employees, Richard Clarke, A. Williman, and Christopher Naul.

Some years ago Dueber owned a watch-case manufactory in Cincinnati, and produced some of the best watch-cases made. As his business grew he moved across the Ohio river to Newport, Ky., where he established large factories, and was one of the largest manufacturers of the kind in the country. He made some of the finest cases there in the trade, and found a ready market for his wares. In 1875 Hagstoz & Thorpe started in the business with thirteen hands, having their manufactory in the *Ledger* building in this city. They obtained possession of the "James Boss' patent gold watch-case," which was a better case, and manufactured for less money than any then made. It consisted of a heavy-solid gold plate on the outside and inside of the case, with an inner plate of a cheaper metal to give it the necessary strength. This was the principle of the patent, but of course the manner of producing the result was a secret known only to themselves. The business so grew that in 1880 they moved to the new buildings at Nineteenth and Brown Streets, where they now employ 500 hands. At that time George W. Childs entered the firm as a special partner, putting $100,000 into the business with the idea of manufacturing silver cases as well as gold. Hagstoz & Thorpe had discovered a new way of making silver watch-cases, using one piece of solid silver for each part of the watch-case instead of making the parts of different pieces of metal, soldered together, as had been the custom under the old method. In this way they made a case much finer in appearance and almost absolutely dust and damp proof.

A VAIN COMPETITION.

Dueber endeavored in vain to equal their work, and now that silver cases of such quality were produced, found his trade fast slipping away from him. About two months ago Richard Clarke, one of Dueber's subordinates, came to this city and took up his quarters in a boarding house on Wylie Street, occupied by the workmen of the watch-case factory. He made himself very agreeable to the workmen, was very liberal with his money, tried to get hold of cases in process of manufacture, and endeavored to decoy several of the skilled workmen away from Hagstoz & Thorpe to work for Dueber, at Newport. If he could have obtained the cases in the different stages of completion, he could have got hints at the peculiar tools used in the different

THE MANUFACTORIES OF THE

JAS. BOSS AND KEYSTONE WATCH CASES.

NINETEENTH AND BROWN STREETS,

PHILADELPHIA, PENNA.

processes, which tools were trade secrets of their firm, and which Dueber was especially anxious to obtain a knowledge of. The workmen, however, were faithful to their employers, and detectives were placed in Clarke's shadow. Several days ago Dueber, himself, came on with the two other employees, Naul and Williman, and established himself at the Continental Hotel, where he invited the workmen of his rivals to sup with him, and to partake of the good cheer of the hotel. The genial workmen dined with him, talked business with him and went home to their emyloyers and reported their adventures. The Philadelphia firm thought that the matter had gone too far, and issued a capias as above set forth. Dueber and Clarke were arrested at the matinee of the Wall Street Theatre, where they had gone to enjoy a different species of "Forbidden Fruit" from that which they had been seeking for some time, little thinking that the meshes of the law were closing about them. The complainants bring suit against the defendants for $50,000, claiming that this is the amount of damage to their business through the loss of their exclusive knowledge. Judge Pierce fixed the bail of each of the defendants at $3000.

DECOYING APPRENTICES.

Failing to gain over any of the men in the employ of Hagstoz & Thorpe, Dueber & Clarke approached several apprentices and endeavored to get them away, thus rendering themselves directly amenable to a special State law relating to the decoying of apprentices. One boy who was getting $16 a week was offered $17. Dueber said to him that he could not roll out the stock without showing the marks of the cogs, and asked how Hagstoz & Thorpe did the work. One man, who made peculiar dies for the getting up of different parts of a case, was offered $24 a week, and then $30, and was told by Dueber that he would see him again. These cases and many others are testified to by the operators, and their affidavits are in the hands of the prosecuting firm.

Appended is an exact copy of a letter found in Clarke's person, the original of which is in the possession of Hagstoz & Thorpe. This letter, written from the office of the firm, and setting forth that the firm will pay all bills incurred by Clarke, implicates without doubt the firm and their subordinates. It also renders them liable for receiving stolen goods:

The
Dueber Watch Case
Manufacturing Company,
Trade X Mark
Cincinnati, Ohio. Factory Office,
Newport, Ky., Aug. 18th, 1882.
P. O. Box 1334.

FRIEND DICK: I received your letter yesterday, I was not at all surprised at you quitting but I wish you Cold of held on a little longer until you got the Centers I want you to keep in Correspondentse with the Center pressman as I shall want him so you can let him know and be sure and get the Centers and send them as soon as you get them, I received the other parcel safe, Dick I want you to find out where a man by the name of William Brown he used to make the springs at Sag Harbor he lives somewhere in Brooklyn but I leave it to you to find out where and send me his address see him yourself if you can and have a talk with him, I want you to get him, I want you to write by return and let me know if you have gone to switter's in State Street to work if you have not got in work I want you to go to Waltham Ma. and try and get on their and let me know what they are doing but do not get out of the trade as I have got a Job for you when you are through if you Can get in at Switters do so for a time any way you Can Get in with some of the boys and have a talk with them and find out what they are doing in fact Dick I want you to Get in every Shop you Can in Brooklyn New York and then go to waltham & when you are through this I want you to go to Philadelphia and do a little work their but their is time to have that over latter, take all the News you can to the office in Maden Lane, Besides what you send Me go their often I am working a good thing for you and I want you to write oftener and let me know if you want Money and how much, and do not be afraid to let me know for what I want you to do will cost you a little money & the Firm will pay you for it.

Yours, NAUL.

DICK:

P. S.—Keep your eyes open, and let me know all you Can you will not loose by it. NAUL.

—*Philadelphia Press.*

WATCHES AND THEIR ABUSES.

Although the manufacture of timekeepers is regarded as simply mechanical, we claim it should rank among the fine arts. We think the watch the only perfect instrument made. No other does as much within itself. Keep the little darling wound and properly cared for, and it will correctly indicate the time for years at a stretch. Day and night, cold or warm, the hands will inform you when to rise in the morning, when to breakfast, when to dine and sup, and inform you the time to retire to rest, beside a multitude of other duties.

In return for all this constancy what kind of treatment does this faithful companion receive? In the first instance we call on the watchmaker and drive the closest bargain we can. For instance, we only want a cheap article for the present, but will get a better when more able; so we will just take an Ellery or a Wheeler, or perhaps a Broadway, as money is a little scarce, and that will answer us just now. We manage to scrape up say ten dollars, and shake it at the watchmaker, and get the handsome and perfect timekeeper that the manufacturer has spent hundreds of thousands of dollars to produce in its now complete state. We have it set just on time by the shopkeeper's regulator, turn out our old pocket and shake a spoonful of dust on the floor, place the new chronometer in its place and start on our regular avocation, perhaps that of a railway brakesman. We make one round trip, compare our time by the regulator, and find after two days' running our pocket darling is just three seconds ahead. Pretty good for a start. We call again in a few weeks, and find that we are just about on time. Weeks and months roll on, and our darling gives the best of satisfaction. But alas! *it stops short.* We carry it back to the dealer, when upon examination, he finds large quantities of dust in every part, and so informs the surprised owner, who is astonished that a little dirt like that could stop a new watch. Why, it ain't fourteen or fifteen months since I bought her new; she can't be dirty so soon as that, as I have taken the best of care of her, and how can she be dirty."

The watchmaker, somewhat annoyed, requests the customer to just turn out his pocket where the watch has spent the last fifteen or eighteen months, when nearly a handful of tobacco, lint and what not falls upon the floor, when the wearer looks with astonishment and admits there may a little dirt got into the watch, but can hardly understand it either, as "you said them cases would hold water." To end the matter the watchmaker takes the watch down, cleans it all through and returns it to the owner as good and nice as the day it left the factory.

John Segsworth & Co.,

WHOLESALE AGENTS FOR

AMERICAN WALTHAM WATCHES,

AND IMPORTERS OF

English and American Jewellery.

This being the commencement of a new business year with us, we beg to thank our many customers for their kind and liberal support during the past, and to assure them that we will endeavour by constantly studying their interests to merit a continuance of the favors so generously bestowed upon us.

Our stock for the coming season will be found well assorted with all Staple Goods, and also with the novelties as they are brought into the market.

As usual our prices will be low and terms liberal.

23 Scott Street, Toronto.

By some change the railroad man is moved to another locality, and after a few months he, through carelessness, perhaps, breaks the mainspring of his watch. He carries it to Brother Soft-Solder Spectacles, Brother Ruby Pin, or may be Brother Hairspring, who finds the mainspring is broken.

"Wal, wal! is that a fact? That watch has run now for about three years, and never cost me a cent. During all that time she only stopped once, and the man I bought her from just blowed a little dirt out of her and she went as well as ever; and now the mainspring is broken; what will that cost, Mister?"

"I can put you in the real American spring for $1.50, or one of the imitation for $1.00."

"Wal, I guess the dollar one will do just as well as any; it is a lot of money to pay for a little thing like that."

He concludes to have it put in, pays his dollar and starts on his journey. But somehow the onion don't run quite right; guess she wants a little regulating. He opens it and pushes the regulator as far around as the index will allow. Now she runs the other way. He handspikes it back to the other side. but still the watch runs badly. He carries her to another watchmaker, who informs him that the watch is very dirty, and must be cleaned before it will keep good time again. He leaves it to be cleaned, pays his money, and gives the watch another trial, he finds it no better; runs all sorts of ways; stops and starts. So he comes to the conclusion that that watch is no good, not worth fifty cents; don't believe its manufacturers can make a watch worth a cent, anyhow, and he'd never buy one of their make again; wouldn't give them pocket room.

There are dozens, yes hundreds and thousands of just such cases arising, and what is the cause? The answer is plain: In the first place the watch is abused; yes, worse than abused—shamefully treated; first by the wearer, second by the botch who placed a half-made soul (as the mainspring is the soul of the watch) in the watch. But there is blame further back than the botch. The manufacturers who made the watch are materially responsible for this botch work, in that they allow foreign watch materials (made like theirs) imported at the disadvantage of a high duty, to be sold at a much less price than they will supply the trade. The result is that this improperly fitting material is extensively advertised, even along with the American, at greatly reduced prices, and many, yes, *many* good watchmakers buy them and use them, to the great detriment of the American watches. The company which has spent so much to perfect and produce so good an article for the money suffers their productions to be ruined and their own reputation injured because they are not satisfied to supply the proper materials for repairs at fair prices. We say fair prices because they charge about four to six times as much for the separate articles which compose the watch as they do for the finished movement, and about twice as much as the imported can be had for. It is all very well, because they can sell all the movements they can make, not to heed the life of the watch once it passes out of their hands; but this neglect will come home to most one of these days. The companies who are making those low-priced goods to compete with foreign goods of similar grades cannot afford to neglect the little wonder even if it has passed out of their control and they have their money. Those foreigners who now send materials into this country, paying duty, freight and other expenses, will continue to do so as long as the people are uneducated in the superiority of the American production, and unless the watch continues to perform well for years, as well after repairs as before, the aim will be at the home-made article, as it stands up as a land mark, while the foreign producer is lost sight of, having no reputation to maintain.

Being an old watchmaker, I have long felt this trouble, and have found many good American watches ruined as time-keepers on account of bad materials used in their repairs, and there is no remedy for the evil but that the manufacturers of American watches look well to the future of their own interests, and see as far as possible that the trade is supplied with suitable materials for repairs as cheap as they can procure them through other sources. Even poor workmen are likely to procure fair results if they have good timber with which to operate, but when cutting, trying, filing and fitting is the the word, as is constantly going on, the result is as stated above, and I feel assured every properly instructed horologist in the land will endorse the above statements.—W. D., of London, Ont., in the *Watchmaker and Metalworker*.

NOTE.—Right you are "W. D." We endorse every word you say, and the readers of THE TRADER would like to hear from you occasionally.—ED. TRADER.

THE WAY TO WEALTH.

CONTINUED FROM LAST MONTH.

From Poor Richard's Almanac.

"But with our industry, we must likewise be steady, and settled, and careful, and oversee our own affairs with our own eyes, and not trust too much to others; for, as poor Richard says,

'I never saw an oft-removed tree,
Nor yet an oft-removed family,
That throve so well as one that settled be.'

And again, 'Three removes are as bad as a fire:' and again, 'Keep thy shop, and thy shop will keep thee:' and again, 'If you would have your business done, go; if not, send.' And again,

'He that by the plow would thrive,
Himself must either hold or drive.'

And again, 'The eye of the master will do more work than both his hands:' and again, 'Want of care does us more damage than want of knowledge:' and again, 'Not to oversee workmen is to leave them your purse open.' Trusting too much to others' care is the ruin of many; for, as the Almanac says, 'In the affairs of the world, men are saved not by faith, but by the want of it; but a man's own care is profitable; for, saith poor Dick, 'Learning is to the studious, and riches to the careful, as well as power to the bold, and heaven to the virtuous.' And further, 'If you would have a faithful servant, and one that you like, serve yourself.' And again, he adviseth to circumspection and care, even in the smallest matters, because sometimes 'A little neglect may breed great mischief;' adding, 'For want of a nail the shoe was lost; for want of a shoe the horse was lost; and for want of a horse the rider was lost;' being overtaken and slain by the enemy, all for want of care about a horse-shoe nail.

"So much for industry, my friends, and attention to one's own business; but to these we must add frugality, if we would make our industry more certainly successful. A man may, if he knows not how to save as he gets, 'keep his nose all his life to the grindstone, and dies not worth a groat at last.' 'A fat

New York, February, 1883.

The new Price List for complete $\frac{40}{4}$ plate, 8, 14 and 16 size gold watches, issued under date of February 1st, by the American Watch Co., of Waltham, is now ready for distribution. We will forward a copy upon application, accompanied by business card, from any regular dealer in watches.

Jobbers who wish copies sent to their customers will please notify us by sending the names and addresses of the same, but such customers must be regular watch dealers.

We shall take special precaution in the distribution of this list in order to keep it out of the hands of the general public, and we beg to request that the Trade will co-operate with us in this undertaking, it being entirely in their interests.

We also beg to call particular attention to the fact that the cases quoted on this list are entirely of our own manufacture, and that we are directly responsible for the quality of the same. By 18k. or 14k. or 10k. we mean 18k. or 14k. or 10k., and not 16'k. or 12k. or 8k. We offer you honest value for your money.

ROBBINS & APPLETON,

General Agents, 5 Bond Street, NEW YORK.

kitchen makes a lean will,' as poor Richard says; and,

'Many estates are spent in the getting;
Since women for tea forsook spinning and knitting,
And men for punch forsook hewing and splitting.'

"'If you would be wealthy (says he in another Almanac), think of saving as well as of getting: the Indies have not made Spain rich, because her outgoes are greater than her incomes.'

"Away then with your expensive follies, and you will not have much cause to complain of hard times, heavy taxes, and chargeable families; for as poor Dick says,

'Women and wine, game and deceit,
Make the wealth small and the want great.'

And, further, 'What maintains one vice would bring up two children.' You may think, perhaps, that a little tea, or a little punch now and then, diet a little more costly, clothes a little finer, and a little entertainment now and then, can be no great matter; but remember what poor Richard says—'Many a little makes a mickle:' and, farther, 'Beware of little expenses; a small leak will sink a great ship:' and again, 'Who dainties love shall beggars prove:' and, moreover, 'Fools make feasts and wise men eat them.'

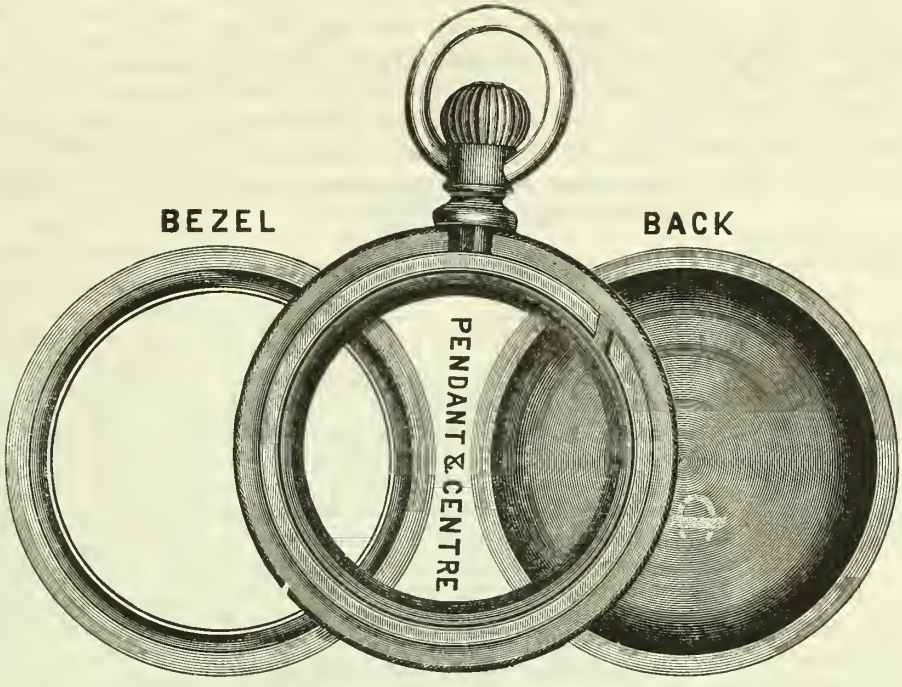
"Here you are all got together at this sale of fineries and nick-nacks. You call them *goods;* but if you do not take care, they prove *evils* to some of you. You expect they will be sold cheap, and perhaps they may for less than they cost; but if you have no occasion for them, they must be dear to you. Remember what poor Richard says—'Buy what thou hast no need of, and ere long thou shalt sell thy necessaries.' And again, 'At a great pennyworth pause a while.' He means that perhaps the cheapness is apparent only, or not real, or the bargain, by straitening thee in thy business, may do thee more harm than good. For in another place he says, 'Many have been ruined by buying good pennyworths.' Again, as poor Richard says, 'It is foolish to lay out money in a purchase of repentance;' and yet this folly is practiced every day at auctions, for want of minding the Almanac. 'Wise men (as poor Dick says) learn by others' harms, fools scarcely by their own; but *Felix quem faciunt aliena pericula cautum.*' Many people, for the sake of finery on the back, have gone with a hungry belly, and half-starved their families: 'Silk and satins, scarlet and velvets (as poor Richard says), put out the kitchen fire.' These are not the necessaries of life; they can scarcely be called the conveniences; and yet, only because they look pretty, how many want to have them! The artificial wants of mankind thus become more numerous than the natural; and as poor Dick says, 'For one poor person there are a hundred indigent.' By these and other extravagances, the genteel are reduced to poverty, and forced to borrow of those whom they formerly despised, but who, through industry and frugality, have maintained their standing; in which case it appears plainly, 'A plowman on his legs is higher than a gentleman on his knees,' as poor Richard says. Perhaps they have had a small estate left them which they knew not the getting of; they think 'It is day, and will never be night; that a little to be spent out of so much is not worth minding.' 'A child and a fool (as poor Richard says) imagine twenty shillings and twenty years can never be spent; but always taking out of the meal-tub, and never putting in, soon comes to the bottom:' then, as poor Dick says, 'When the well is dry, they know the worth of water.' But this they might have known before, if they had taken his advice: 'if you would know the value of money, go and try to borrow some; for he that goes a-borrowing goes a-sorrowing, and, indeed, so does he that lends to such people when he goes to get it again.' Poor Dick further advises, and says,

'Fond pride of dress is sure a very curse:
Ere fancy you consult, consult your purse.'

"And again, 'Pride is as loud a beggar as Want, and a great deal more saucy.' When you have bought one fine thing, you must buy ten more, that your appearance may be all of a piece; but poor Dick says, 'It is easier to suppress the first desire than to satisfy all that follow it.' And it is as truly folly for the poor to ape the rich, as the frog to swell in order to equal the ox.

'Vessels large may venture more,
But little boats should keep near shore.'

"'Tis, however, a folly soon punished; for 'Pride that dines on vanity sups on contempt,' as poor Richard says. And in another place, 'Pride breakfasted with Plenty, dined with Poverty, and supped with Infamy.' And, after all, of what use is this pride of appearance, for which so much is risked, so much is suffered? It cannot promote health, or ease pain; it makes no increase of merit in the person; it hastens misfortune.



'What is a butterfly? At best
He's but a caterpillar drest;
The gaudy fop's his picture just'—

as poor Richard says.

"But what madness must it be to run in debt for these superfluities! We are offered, by the terms of this sale, six months' credit, and that perhaps has induced some of us to attend it, because we cannot spare the ready money, and hope now to be fine without it. But, ah! think what you do when you run in debt. You give to another power over your liberty. If you cannot pay at the time, you will be ashamed to see your creditor; you will be in fear when you speak to him; you will make poor, pitiful, sneaking excuses, and by degrees come to lose your veracity, and sink into base, downright lying; for, as poor Richard says, 'The second vice is lying; the first is running in debt.' And again, to the same purpose, 'Lying rides upon debt's back;' whereas, a freeborn Englishman ought not to be ashamed nor afraid to speak to any man living. But poverty often deprives a man of all spirit and virtue. 'It is hard for an empty bag to stand upright,' as poor Richard truly says. What would you think of that prince, or that government, who would issue an edict, forbidding you to dress like a gentleman or gentlewoman, on pain of imprisonment or servitude? Would you not say that you were free, have a right to dress as you please, and that such an edict would be a breach of your privileges, and such a government tyrannical? And yet you are about to put yourself under that tyranny when you run in debt for such dress! Your creditor has authority at his pleasure to deprive you of your liberty, by confining you in jail for life, or by selling you for a servant, if you should not be able to pay him. When you have got your bargain, you may perhaps think little of payment; but 'Creditors (poor Richard tells us) have better memories than debtors;' and in another place he says, 'Creditors are a superstitious sect, great observers of set days and times.' The day comes round before you are aware, and the demand is made before you are prepared to satisfy it; or if you bear your debt in mind, the term which at first seemed so long will, as

it lessens, appear extremely short. Time will seem to have added wings to his heels as well as to his shoulders. 'Those have a short Lent (saith poor Richard) who owe money to be paid at Easter.' Then, since, as he says, 'The borrower is a slave to the lender, and the debtor to the creditor,' disdain the chain, preserve your freedom, and maintain your independence: be industrious and free; be frugal and free. At present, perhaps, you may think yourselves in thriving circumstances, and that you can bear a little extravagance without injury; but

'For age and want save while you may,
No morning sun lasts a whole day,'

as poor Richard says. Gain may be temporary and uncertain; but ever, while you live, expense is constant and certain; and 'It is easier to build two chimneys than to keep one in fuel,' as poor Richard says. So, 'Rather go to bed supperless than rise in debt.'

'Get what you can, and what you get hold;
'Tis the stone that will turn all your lead into gold,'

as poor Richard says. And when you have got the philosopher's stone, surely you will no longer complain of bad times, or the difficulty of paying taxes.

"This doctrine, my friends, is reason and wisdom; but, after all, do not depend too much upon your own industry, and frugality, and prudence, though excellent things; for they may be blasted without the blessing of Heaven; and therefore ask that blessing humbly, and be not uncharitable to those that at present seem to want it, but comfort and help them. Remember Job suffered, and was afterwards prosperous.

"And now, to conclude, 'Experience keeps a dear school; but fools will learn in no other, and scarce in that; for it is true we may give advice, but we cannot give conduct,' as poor Richard says. However, remember this, 'They that will not be counseled cannot be helped,' as poor Richard says, and further, that 'If thou will not reason, she will surely rap your knuckles.'"

Thus the old gentlemen ended his harangue. The people heard it, and approved the doctrine, and immediately practiced the contrary, just as if it had been a common sermon; for the auction opened, and they began to buy extravagantly, notwithstanding all his cautions and their own fear of taxes. I found the good man had thoroughly studied my Almanac, and digested all I had dropped on those topics during the course of twenty-five years. The frequent mention he made of me must have tired every one else; but my vanity was wonderfully delighted with it, though I was conscious that not a tenth part of the wisdom was my own, which he ascribed to me: but rather the gleanings that I had made of the sense of all ages and nations. However, I resolved to be the better for the echo of it; and though I had at first determined to buy stuff for a new coat, I went away, resolved to wear my old one a little longer.

BUSINESS CHANGES FOR FEBRUARY

A. McDowell, hardware, Hamilton, sold out and left; Henry J. Heard, hardware and tins, St. Thomas, Ont., closed up under chattel mortgage; Wm. Gunn, fancy goods, St. Thomas, Ont., sold out; W. Carter, jeweler, Montreal, bailiff in possession; W. G. Whitehead, fancy goods, Winnipeg, stock sold by the sheriff; G. J. Clarke, jeweler, Wingham, selling off and intends giving up business; Wm. Croft & Co., fishing tackle, Toronto, have admitted Wm. Croft, Jr., into partnership, style now, Wm. Croft & Son; H. B. Coates & Co., jewelers, Stratford, sued by W. E. Jones, Stratford; Henry & Lacroise, wholesale saddlery hardware, Montreal, damaged by fire.

BUSINESS NOTES.

Messrs. J. & J. Taylor's safe works were destroyed by fire since our last issue, loss about $40,000. With their usual energy, however, the firm are again running and preparing to ship goods as usual.

We are glad to be able to say that Mr. John Zimmerman, of the firm of Zimmerman, McNaught & Lowe, is now almost completely recovered, and although he will not be able to travel for a few months, he trusts to have the pleasure of seeing his old friends and customers at the warehouse when they visit the city.

The Waltham Watch Co. turned out its 2,000,000th watch last month. The employees of the Company celebrated the fact by a banquet, at which the health and prosperity of the Company was enthusiastically toasted. It is certainly a wonderful output from one factory, and shows what may be accomplished by capital, skill and enterprise.

Death of a Promising Young Man.—Mr. Wm. Wm. Jardine, for a number of years chief computing clerk at the Customs, died at the residence of his parents, 194 Spadina Avenue, early Sunday morning. Deceased commanded the respect of the mercantile community, his feiow clerks and a large number of friends in this his native city.

The customs facilities at this port are not at all commensurate with the necessities of our importers. The chief want is greater accommodation. The city's representatives at Ottawa have been urging the subject upon the attention of the Minister of Public Works, with, it is hoped, some likelihood of the requisite accommodation being provided. Toronto is such an important port of entry that it is as much to the interest of the public treasury as of the city, to make every provision for shippers and importers.

The annual consumption of watch-face crystals is placed by the *Revue Chronometrique* at 100,000,000. This total, however, includes the crystals required for toy watches, lockets, compasses, etc. The annual production of watches is placed at 2,500,000, and the stock manufactured during fifty years at 70,000,000. To this is to be added 50,000,000 "old watches." Of the number in use it is believed that 87,000,000 require a new crystal face once a year. This, with stocks kept on hand, call for the annual supply named above.

A western exchange says that burglars are so plentiful and daring in his State that merchants are afraid to lock their safes at night, but content themselves with leaving them open in preference to having them spoiled by being blown open. One large milling firm, it is said, has a card attached to the front of their safe giving the combination of the lock and asking burglars to be kind enongh to open the lock according to the instructions on the card. It is quite evident that those verdant Yankees out west never heard of J. & J. Taylor's safes, for if they had they would have secured them, and then had peace of mind, and been able to snap their fingers at the midnight prowlers.

Colonel Panet, Deputy Minister of Militia, has returned to Ottawa, and brings with him sample boxes of cartridges manufactured at the Government Works in Quebec, for distribution among the members. The cartridges are for Snider rifles, and he claims that they are superior to English or American manufacture. The capacity of the factory is about four million cartridges per annum, but it is not in full blast yet. Although the machinery was built for Snider sizes only, it is so arranged that with the expenditure of not more than $1,000 it can be altered to Martini-Henry size. This was considered advisable in the event of the Martini-Henry replacing the Snider.

The second annual meeting of the Toronto Silver Plate Co. was held at the Company's office, King St. West, Toronto, on Thursday the 15th ult., the President, Mr. James A. Watts in the chair. After the reception of the Director's report, which showed that the company had got over its initial difficulties and was now fairly under way, with cheering prospects of success, the following gentlemen were elected as directors for the ensuing year: Alfred Gooderham, W. H. Beatty, W. H. Partridge, W. Thompson, G. Harrison, J. Webster, J. A. Watts. At a subsequent meeting of the directors J. A. Watts, Esq., was elected President, and Alfred Gooderham, Esq., Vice President.

It is a pity that prominent Englishmen who cross the briny, spend a few weeks in the United States and then return to England, always puff up the States as a good place for English emigrants and studiously ignore Canada. The papers bewail the fact, and wonder what can be the reason of it. Partly it may be the fault of

the papers themselves. When the Grits are in power the Tories make out that the country is all going to the dogs and that people are being driven out of it. When the Tories are in power the Grits turn round and declare the same thing. People in England no doubt get an occasional copy of a Canadian paper from friends on this side of the world and see what is being said. They argue that if Canadian papers speak in that strain of the country there must be some truth in what they say. Another reason is that prominent Englishmen see a colony and a great nation side by side, and are naturally attracted by the great nation and speak in its behalf when they go home.

A NEW INDUSTRY FOR CANADA.

Last week we paid a visit to the works of the Toronto Silver Plate Co., the first factory in Canada that has commenced the manufacture of electro silver-plated ware in all its details in this country. It is true we have other plate factories here, but they are branches of well-known American manufactories, who make the blanks, (as the goods in the metal, unplated, are called) at their works in the United States, and simply plate them at the factories here.

The Toronto Silver Plate Co., however, propose to manufacture the goods from the very foundation, and to combine within the walls of their own factory every detail and process from the alpha to the omega of the trade.

A visit to their factory, on King Street, will well repay any person interested in the manufacture of articles of this class. Accompanied by the general manager, Mr. James A. Watts, we were conducted from garret to cellar of the entire building, and while thanking him for his courtesy, we could not help expressing our astonishment at the perfection and completeness of the factory's equipment. From the mighty "Corloss" engine of fifty horse power, that silently and apparently without effort, drives the heavy and rapidly revolving machinery, to the powerful presses, some of which cost nearly $3,000, and steam rollers, everything was of the most perfect description and gave promise of fully carrying out the wishes of the makers.

In one department we found the moulders busy ladling the liquid metal from red hot cauldrons into moulds, and turning out with great rapidity, caster, pickle and tea pot handles, and many other articles of like kind, destined to form a prominent part of the elegantly finished goods with which the show room is fast being filled. In the spinning department might be seen the wood turners making chucks on which to turn the metal, and the metal spinners, with the help of these wooden chucks, fashioning the metal into caster bands, cake baskets, &c., on their rapidly revolving lathes. But time would fail us to tell of the plating department with its immense vats of silver solution and its rapidly revolving electric motor, from which is generated the electricity which modern science has so well utilized in this department of the fine arts; or, of the burnishing room with its long row of men with their steel burnishers, driven with their seemingly tireless arms to the cheery music of some Moody and Sankey melody or opera song; or of the department where the designers and mould makers reign supreme, and everybody seems so quiet and studious that a novice might imagine that the workers were amusing themselves instead of working; or of the immense stock room, whose shelves are loaded down with glass of every description, from the cheap, plain pickle jar to the richly decorated vase or berry dish of Bohemian manufacture. The show room, with its elegant cherry and plate glass cases, with their maroon linings, and elegant display of silverware, is a sight that once seen cannot be easily forgotten.

In fact the whole equipment of the establishment is complete, and this country is to be congratulated upon possessing within its limits a manufactory that bids fair to produce goods in this line fully equal in design, finish and quality to any imported from abroad. We sincerely trust that this new industry may grow and flourish, because it is by such establishments as these that any country is made commercially great and independent.

THE SECRET OF HOW BOSS CASES ARE MADE

Appears to be a valuable one if we we may judge from the pains that some of its rivals have been at to find it out. We have often remarked that when any man gets hold of a good thing there are always plenty of fellows ready and anxious to help him with it and share the profits with him. This seems certainly to be the case of the "Boss" Case people—they have the boss case in name and reality, and other makers, recognizing this fact, have of late been endeavoring, without their consent or approval, to help them out with it and their fairly earned profits. As is perhaps too seldom the case, these attempts have proved unsuccessful, and the would-be stealers of other people's brains have been forced to beat a hasty and ignominious retreat. The latest attempt of this kind, we are sorry to observe, was on the part of the Deuber Watch Company, who it appears attempted unsuccessfully to entice away some of Messrs. Hagstoz & Thorpe's workmen in order to learn their trade secrets in connection with the Boss case. The proprietors of the Boss Case allowed the matter to go so far, and then quietly nipped the thing in the bud by having Mr. Deuber arrested for conspiring to entice away their workmen. Mr. Deuber was, of course, released on bail, and so the matter ends for the present.

It certainly seems a great pity that rival manufacturers can't stick to honest competition instead of resorting to such underhand strategy as appears to have been employed in this case. Messrs. Hagstoz & Thorpe are to be congratulated on the fact that the treatment of their employees has been such as to make them serve them with unswerving loyalty, for by their honesty and good will only could they have been enabled to baffle such designs as those of the Deuber Company.

The result will probably be that after the smoke has cleared away, it will be a good advertisement for a good article, for certainly as imitation is the highest form of flattery, so is such an attempt of a rival manufacturer an admission that the article he attempts to obtain by such means is the best he knows of, and worth running a good deal of risk to obtain.

Messrs. Hagstoz and Thorpe need seek for no higher testimonial as to the value of the "Boss" case than it was so good that their competitors were bound to secure its secret by any means and at any price. It certainly won't do the boss case any harm, whatever effect it may have on the Deuber Company.

WORKSHOP NOTES.

Etching Fluids.—For copper: Aquafortis, 2 oz.; water, 5 oz. Steel: Iodine, 1 oz.; iron filings, ½ dr.; water, 4 oz. Digest till the iron is dissolved. For fine touches. Dissolve 4 parts each of verdigris, marine salt and sal ammoniac in 8 parts vinegar, add 16 parts water, boil for a minute and let cool.

Bending Glass Tubes.—Hold the tube in the upper part of the flame of a spirit lamp, relvolving it slowly between the fingers; when red hot it may be easily bent into any desired shape. To soften large tubes, a lamp with a double current of air should be used, as it gives a much stronger heat than a simple lamp.

Silvering Solution.—The following is a good silvering solution for electrotype plates: Nitrate of silver, 2 drs.; distilled water, 37 drs. Dissolve and add sal ammoniac, 1 dr.; hydrophosphite of soda, 4 drs.; precipitate of chalk, 4 drs.; agitate the preparation occasionally for twelve hours, when it will be ready for use. Apply with a fine sponge.

Cement for Petroleum Lamps.—Boil three parts of resin with one part of caustic soda and 5 of water. The composition is then mixed with half its weight of plaster of Paris, and sets firmly in from ½ to ¾ of an hour. It is of great adhesive power, and not permeable to petroleum, a low conductor of heat, but superficially attacked by hot water.

Rust Preventive.—To keep machinery from rusting, take ½ oz. of camphor, dissolve in one pound of melted lard; take off the scum and mix in as much fine blacklead as will give it an iron color. Clean the machinery and smear it with this mixture. After twenty-four hours, rub clean with a soft linen cloth. It will keep clean for months under ordinary circumstances.

To Prevent Rust.—Cast iron is best preserved by rubbing it with blacklead. For polished work, varnish with wax dissolved in benzine, or add a little olive oil to copel varnish, and thin with spirits of turpentine. To remove deep-seated rust, use benzine and polish off with fine emery, or use tripoli, 2 parts; pulverized sulphur, one part. Apply with soft leather. Emery and oil is also very good.

To Clean Old Oil Paintings.—Dissolve a small quantity of salt in stale urine; dip a woollen cloth in the mixture and rub the paint over with it until clean; then wash with a sponge and clean water, dry gradually and rub over with a clean cloth. Should the dirt not be easily removed by the above preparation, add a small quantity of soft soap. Be careful not to rub the painting too hard.

Printing on Glass.—A Frenchman, M. Wilbaux, has taken out a patent to use an elastic type for printing on glass, with fluor spar, ren-

this Trade Mark is stamped on all Knives, Forks, Spoons and other flat ware of our manufacture.

The A 1 Goods are Standard Heavy Plate, and XII signifies that in addition the articles have an extra quantity of Silver on all the parts most exposed to wear.

The Meriden Britannia Company have been awarded the highest premiu ns wherever exhibited, from the WORLD'S FAIR, 1863, to the PRESENT TIME, and the high reputation of our Goods throughout the world has induced other makers to imitate our Trade Marks and name as well as our designs, and as many of our patrons have, through a similarity of names, purchased inferior goods under the impression that they were our manufacture, we are compelled to ask especial attention to our Trade Marks.

THE FACT THAT OUR NAME AND TRADE MARKS ARE BEING SO CLOSELY IMITATED SHOULD BE A SUFFICIENT GUARANTEE TO THE PUBLIC THAT OUR WARES ARE THE BEST IN THE WORLD.

WE RE-PLATE OLD WORK AND MAKE IT EQUAL TO NEW.

dered adhesive by some such material as mucilage or printer's ink; sulphuric acid of suitable temperature is then allowed to act on that portion of the glass. The hydrofluoric acid generated in this way would etch the glass on the places printed. When completed the whole is washed off with warm water and lye.

SCIENCE AND OTHER NOTES.

AMBER.—The yield of amber of the German Ocean is increasing. During the year 1880 it amounted to 315,000 pounds, and was obtained by means of steam-dredging machines; while in 1879, it amounted to 280,000 pounds. In one place 158 overseers and 800 workmen, and in another 500 workmen, were occupied.

PUBLIC INSTRUCTION OF PARIS.—The municipal budget of instruction for 1882, of the city of Paris, amounts to 23,000,000 francs, of which 99,700 francs are for higher branches; 1,541,793 for middle, and 14,990,800 for primary; 2,851,740 are for special primary; 1,250,400 for professional, technical, and special; 427,600 for the associations of public instructions and orphanages; 1,996,600 for asylums, etc.

GLYCERINE MIRRORS.—Glycerine separates the silver from an ammouiacal solution of silver nitrate, produces a more perfect mirror than aldehyde. The separation of silver is incomplete without the employment of heat. Upon the addition of a solution of potassium hydroxide, the separation is effected without heating. Alcohol and ether promote the separation of the silver in the hot solution. It is said that the mirrors are brighter in dark than in light.

BULLFROGS.—According to the *Vienna Landw. Ztg.*, English agents are busily scouring over Austria for the purchase of bullfrogs, paying for them at the rate of 30 to 40 fl.—$13 to $15—per 1,000 They are packed in moss-lined perforated boxes and expedited to England and Holland. A Mr. Krelage, of Harlem, Holland, one of the largest garden owners of that country, and a Mr. Smith, of England, purchase these interesting animals for their storehouses, to consume the many insects and cockroaches.

SUGGESTIVE.—A Paris correspondent says: "The paper manufacturer who would send a skilful, intelligent workman to Japan, to study the uses to which paper is put there, and to select judiciously those which may be introduced here, would be sure to amass a great fortune. The great changes of the coming age will be the uses to which glass, paper, and porcelain are going to be put. London jewelers find gas and glass their best shields from burglars; glass floors, counters and shelves are getting common. Porcelain and earthenware walls are beautiful and recommended by many advantages."

MICROSCOPES.—The power of the microscope has been increased so greatly by modern science that it will magnify objects of about 100,000 diameters. Unassisted human vision can perceive no objects smaller than the three-hundredths inch in diameter; but the microscopist, with the best instrument, is able to examine monads one-hundred-thousandth of an inch in diameter. Beyond this is obscurity. Scientific men estimate that the ultimate particles or atoms composing all matter can be no smaller than one twenty millionth part of an inch in diameter, and it appears to be barely probable that they will ever be revealed to the human eye.

SIGNIFICATION OF "STERLING."—When, during the middle age, the commercial England of to-day was only a feeble infant, its commerce so to say, stood under the tutelage of that most famous union of the free hanseatic cities of North and Middle Germany, embracing Brugge on the west, Novgorod, in Russia, on the east, and Bergen, in Norway, on the north. These hanseates were called "Easterlings," by the English, that is, the eastern merchants, and England was so much dependant upon them that their money was the circulating medium of the country. One pound "sterling" signified one pound of the money of the Easterlings. Times have changed considerably since then.

A COMPARISON of the wealth of Great Britain and the United States has recently been made by Mr. Mulhall, well-known as a capable and painstaking English statistician. He estimates the total wealth of the United States at $49,770,000,000, and that of Great Britain at $40,640,000,000. This, however, includes the lands of both countries, deducting which leaves the United States with $42,000,000,000 of "wealth proper" against $38,940,000,000 for England. The increase of wealth in the United States during the last decade has been at the rate of 35 per cent.

A SUCCESSFUL EXPERIMENT.—"I have been told," said Mr. Dubious, watching the great steam hammer in the rolling-mill, "that a good hammer-man can break the crystal of a watch with that thirty-ton hammer." "Yes, sir," said the hammerman, "it can be done." "I should like to see it," said Mr. Dubious, eagerly, feeling in his watch pocket. "I can do it, sir," replied the man. "And will you?" replied Mr. Dubious, drawing out his watch. "Come, I am anxious to see it tried." He laid his watch on the great anvil plate. The hammer rose up to its full height and the next instant all its ponderous weight, with a crushing force that shook the ground for an acre round, came down on that watch. "There, sir," said the hammerman, quietly, "if you don't believe that crystal is broken, just stoop down and you can see it sticking to the hammer." Mr. Dubious swallowed a whole procession of lumps and gasps before he could speak. "But I forgot to say," he exclaimed, "that it was to break the crystal without injuring the watch." "Oh, yes," said the hammerman; "yes I know; I have heard that rubbish myself, but it's all gammon. I don't believe it can be done. But you can break the crystal every time."—*Burlington Hawkeye.*

Editorial.

DIVIDE FAIRLY.

In the discussion on Mr. Beaty's bill (now before Parliament) for the equitable distribution of Insolvent assets, some of the speakers seem to have gone out of their way to display their ignorance of commercial affairs. As we understand the matter, Mr. Beaty has two bills before Parliament, one for the discharge of insolvents since the repeal of the last Act, and another for the equitable distribution of Insolvent Estates. There is of necessity no connection whatever between these two bills, and it reflects but little credit upon the astuteness of some of the members of our House of Commons, that they could not discuss the latter bill without dragging in that regarding the discharge of Insolvents, and attempting by such outside issues to lead to its defeat. About the fairness of equitable distribution of Insolvent Estates, there can be no doubt whatever, the principle is sound to the core, and will stand the test of time and investigation. The question of Insolvents discharge is one, however, on which men will differ, and we can respect the opinions of those who differ from us conscientiously ; but that of " Rateable distribution of Insolvents' assets" is one that all are agreed upon as being right, and therefore should have nothing thrown in its way to prevent its becoming law. We trust that in spite of any and all such quibblers, that the end of the present session will see it an accomplished fact, and thus relieve trade from an incubus that is weighing upon it, and at the same time do away with the manifold frauds engendered by the present position of this very important matter.

BEWARE OF SMUGGLERS.

We have several times warned our readers of the danger of buying goods from fictitious jobbers of little or no standing or responsibility. Another illustration of the reality of this danger has recently come to light, owing to the seizure, by the Canadian Customs' authorities, of the goods and books of one of these " Cheap John jobbers" that are demoralizing the jewelry trade of this country. In regard to this seizure, a contemporary says :

" How an unscrupulous dealer can dodge the Customs' officials, has been shown of late by the operations of a Buffalo firm, King & Easil. Having rented a room at Fort Erie, the contents of which were one safe, they had a traveller on the road in this country taking orders for jewelry. He represented to the trade that the firm had a large factory in Fort Erie, and sold goods duty paid, whereas the orders were filled in Buffalo and the goods entered at Fort Erie only to a limited extent and at low value. Besides this, watch cases and plain gold rings to the extent of $3000 or $4000 came into Canada without entry, the past year, and the amount pocketed by the firm at the expense of the importer and the Government during the three years would be fully $10,000."

From our personal knowledge of the trade of this country, we have no doubt but that all that our esteemed contemporary says in reference to this case is strictly correct, and if the evil stopped with the frauds of this firm, it would be but a slight matter, but unfortunately it does not, for as every one in the trade well knows, they are only one of the many of such unscrupulous jobbers, who not only cheat the Government, but demoralize all honest trade by their fraudulent practices.

We think we are safe in saying that there are at least half a dozen of such rascals in business not more than 100 miles from Toronto, and that the sooner the Government put a detective on their track the better it will be for the jewelry trade generally.

Some of these fellows are well known, and we understand that the regular wholesale jewelry houses of this city are about forming themselves into a league for the purpose of furnishing to the Government detectives information that will lead to the detection and conviction of these commercial pirates.

" Informer" is not a position or title that any one covets, and the dislike of the name and occupation has heretofore kept these gentlemen aloof from aiding any of the Government detectives ; now, however, that they find their honest trade so seriously interfered with and themselves gradually being supplanted by a lot of scoundrels, they think it time to fight the devil with fire, and if we mistake not, they will make it hot for some of these " gentlemen."

In this step we think they are to be commended and encouraged, and we think that between them and the staff of detectives that the Government are willing to place at their disposal these commercial freebooters should be cleaned out root and branch.

The time for inaction is past, both wholesale and retail trade alike are menaced by disaster if these harpies are allowed to prey upon the trade of this country.

No retailer is safe who buys such goods, for as everyone knows who has kept himself posted by reading THE TRADER, the Customs officials can step into his store any day and seize any goods that have not paid duty, no matter from whom bought.

Extra cheap goods are thus as dangerous to handle as stolen goods, and it is a well known fact that in all cases where goods are seized under circumstances similar to the above quoted instance, the firm's books are carefully looked into, their customers marked, and the contraband goods seized by the Government, no matter in whose keeping they happen to be. That they are honestly paid by the retailer having them in his possession is just so much the worse for him, because if he still owed for them he could refuse payment, but if the money be already paid, his chance of seeing it is a very poor one.

Retailers have the remedy for this sort of thing in their own hands, and it is to refuse to buy goods from other than recognized wholesale houses of standing and character.

Itinerant jobbers and pedlars selling at or below cost should be left severely alone, for merchants may depend upon it

that in nine cases out of ten their goods are crooked and they are unsafe for them to handle. A word to the wise should be sufficient.

THE DUTY ON JEWELRY.

Every one of our readers will remember the stand that we have always taken in regard to the duty on jewelry, viz., that while the trade is perfectly satisfied to pay the rate levied by the present tariff, if it can be collected alike from all, they consider that the Government should either find means of properly enforcing its collection, or else give the trade fair play by reducing the duty one half and protecting them in that way against smuggling.

It is perfectly absurd for any Government to attempt to collect any such rate of duty as twenty and twenty-five per cent. on goods so expensive and small in bulk as jewelry. It can't be done in any country, let alone such a one as Canada, with only an imaginary border line of nearly two thousand miles separating them from the market from whence the greater part of their supply comes. In plain English, as things at present stand, the Government collect duty from the honest importers, who, by their very honesty in making these payments, are unable to compete against the unscrupulous rivals who are willing to risk an occasional seizure of their goods in preference to paying the duty on the whole.

The Government either do not see this, or are wilfully blind regarding it, for it is a thing that is being brought painfully to the regular importer's notice every day.

Scarcely a day passes but he is confronted with quotations from small one-horse houses (who can't possibly buy as well let alone any better than he does), that are simply his cost, or so near it that there is no fun in it. Do those men sell goods at cost and make a living out of it? Hardly! they know better than that. How is this done then? Any one in the trade will tell you simply by their smuggling the goods into this country, and thus having the duty for their profit.

We have always expressed surprise that the Government should so long have held out a protecting hand to these scalliwags, for it is only by the help of the high duty that they could thrive at all. Take away or even reduce the duty one-half, and their occupation, like Othello's, would be gone, and they would have to take a very humble back seat in the commercial world.

As things are at present they are the "cocks of the walk," and their "very low" prices are flung in the faces of honest importers by retail dealers, who know as well as those from whom they bought that the goods quoted are dishonest goods, and it is only on this account that they are lower in price.

A most glaring instance of the folly of the present tariff, is the duty on precious stones. Strange to say they have some faint glimmering of reason, for following the the old anti-N. P. tariff, Diamonds unset are placed on the free list; all other unset stones, including rubies, emeralds, sapphires, which mineralogists tell us are really only diamonds of a different color, are rated at twenty per cent. These stones cannot be cut in this country to pay. The only lapidary we have imports them himself, because he can do so and pay even the duty now levied, for less than one-quarter of what he could cut them for himself. They are raw material to our manufacturing trade, who are thus compelled to pay a profit of twenty per cent. on them to the Government, and which is really placing them at a disadvantage against their foreign competitors by just so much, while the duty levied on the goods into which these stones are wrought, even if it could be collected, is only twenty per cent., but as enough of them are smuggled into this country to break the price, it is equal to no protection at all.

We notice that the Tariff Commission appointed by the United States Congress to revise the tariff, recommended amongst other things an advance of duty on precious stones unset from ten to twenty-five per cent. ad valorem. It appears that the Committee recommended this change without consulting the trade, and the result was that as soon as the latter got wind of it they got up a memorial and laid it before the Committee, which so enlightened them that they at once struck out the change and brought the duty back to the former figure of ten per cent.

We, therefore, find that even the United States, protectionist as it is to the core, and the pattern that we have taken for our tariff, admit unset stones at ten per cent., while we charge our manufacturers exactly double that duty. The same arguments exactly that apply to precious stones unset will apply to them set in gold, or to any other jewelry, and all the sophistry in the world won't change it.

For the benefit of our readers we reprint the memorial sent by the leading jewelers of the United States to the Committee of Ways and Means above referred to, simply remarking that the true state of the case is fairly and honestly put, and that if the word "jewelry" was substituted for the words precious stones all through the document, the logic would be equally true and unanswerable.

The petition runs as follows:

NEW YORK, Jan. 5, 1883.

To the Committee of Ways and Means of the U. S. House of Representatives:

The undersigned are all engaged in business as *importers* of *diamonds* and *other precious stones.*

Your petitioners have learned that it is proposed to amend the tariff and to advance the duty on precious stones from *ten* per cent. *ad valorem* to *twenty-five* per cent. *ad valorem.* We beg to represent to you that such an advance in the customs duty would be a fatal blow dealt to a large and growing business in this country, wherein are employed large amounts of capital and many people. Our objections to the proposed increase of duties may be briefly stated as follows:

1st. Owing to the valuable character of precious stones, their small bulk, and the readiness with which they can be concealed, they offer a great temptation to smugglers. To increase the rewards to be obtained from an illicit traffic, is to increase the volume of that traffic.

2d. Under the present tariff frequent cases of smuggling are reported; but under an increased tariff smuggling would be the rule to such an extent that honest importers could not compete in the markets of the country against goods so smuggled with goods upon which the tariff had been paid. As a consequence, reputable merchants would be driven out of the business of importing precious stones, and unscrupulous and law-defying men would obtain control of the traffic.

3rd. Under the ten per cent. duty, a greater portion of the taxes due the Government on importations of precious stones is collected with little trouble or expense, because the business is mainly in the hands of reputable merchants. Under an advanced tariff the Government would be subjected to greater expense in watching smugglers, and would obtain less revenue than it does now. Rogues would be substituted for honorable merchants in the business of bringing precious stones to this country.

4th. The facilities for intercommunication between the United States and Europe are now so great that many tourists pass to and from every year.

WITHOUT A RIVAL.

THE JAS. BOSS'

Perfected Gold Watch Case

SOLID GOLD BOW.

NEW AND EXCEEDINGLY FINE FULL ENGRAVINGS.

The great success of this NEW case is to be attributed to the fact that to it is applied the same TALENT that is to all the products of the Keystone Factory, and so it is the common saying

"IT BEATS THE WORLD."

With a high tariff on precious stones, necessitating high prices in this country, and the facilities with which they can be concealed, many tourists would buy goods of this class in Europe, trusting to their adroitness to evade the customs officers on this side of the ocean. In consequence, the traffic in precious stones would be transferred from this country to Europe, and the men and capital now employed here in importing them and preparing them for the market would be left idle.

5th. The jewelry trade in general suffers greatly from the illicit traffic in jewelry carried on along the Canadian border. Should the duty on precious stones be advanced as proposed, this evil would be greatly aggravated, involving the Government in much expense to increase and maintain its customs service on the northern border of the United States.

6th. Under the present duty the temptation for smuggling is not sufficient to defeat the honest purposes of reputable importers and merchants, but we firmly believe that any increase above ten per cent. *ad valorem* would have a tendency to promote smuggling, and to destroy an industry from which the Government now derives a considerable revenue.

THE RAILWAY COMMISSION.

From present appearances it seems doubtful whether in the near future the railways won't control this country, instead of the country controlling its railways. The indications now point with certainty to the fact that ere long the traffic of Canada will be at the mercy of two railway corporations, viz., the "Grand Trunk" and "Canada Pacific," and it depends entirely upon the jealousy of these competitors whether the public are to be fairly served or not. Corporations are said to be soulless, and these are not exceptions to the rule, as any one may judge from the past record, either of the Grand Trunk or the Canada Pacific. They have each bled the public in two ways—one by getting all they could in subsidies, and then by discriminating against them in freight and passenger rates, in favor of United States through freight and passengers, who never contributed one cent to their construction or maintenance.

We have often before pointed out the fact that these railroads are like huge vampires, slowly sucking the life-blood of this country's commerce. They charge to the extreme limit the law allows, and in many cases go beyond it, and the sufferers from their legalized tyranny have no chance of redress. It is absurd that in this age of perfected railway travel with the cost of construction and maintenance reduced to almost one-half of its former price, that freight and passenger rates should still be kept up to the old-time figures. These railways still charge three cents per mile for carrying passengers, while better companies can carry them at two cents per mile and make it pay. Even this rate is sometimes exceeded where they have the chance to do it. That these rates are exhorbitant is proved not only by the fact that other roads, such as the New York Central, can regularly carry passengers at one-third less and make it pay; but that these very roads themselves can and do at times carry passengers for less than one cent per mile and make money out of it.

We also fail to see why if any reduction in rates is to be made, they should not be given to the Canadian taxpayer who helped to build the road, equaly with the American citizen across the lines, who simply pays for the services they render him.

There cannot be a shadow of a doubt in any impartial mind that the citizens of Canada are not at present, nor have they in the past, received fair treatment from the railway powers that be. We hail, therefore, with more than ordinary satisfaction, Mr. Dalton McCarthy's bill, at present before the House of Commons, proposing to appoint a Railway Commission composed of three persons, who shall in themselves form a Court of Appeal in all matters of railway abuse, and have the power of enforcing any decision they may arrive at, concerning any complaints brought to their notice. Great Britain has such a commission, which has been found to work well, owing probably to the fact that they have appointed capable and independent men to carry it out. We trust if this bill, now before the House, becomes law, that we shall also secure competent men for the position; if not, and some political trickster is appointed, we may find ourselves in a worse position than we at present occupy. Mr. McCarthy in his speech upon it, referring to the *personelle* of the commission, said, one should be an experienced railway man, another a lawyer, and the third a man of common sense. We trust that they may all have the latter qualification in a large degree, and what is equally important, have independence enough to refuse to truckle to wealthy corporations, because they are able to accord them privileges that cannot be given by the public.

Selected Matter.

COMMERCIAL LEGISLATION.

The opening of the Parliamentary session, *minus* the prospect of exceptional special measures in the Ministerial programme, affords ground for hoping that our legislators may be enabled to pass enactments which have long been anxiously expected by the commercial and trading classes of the country. Some of these measures have been before the public for an unconscionably long time, but have not, as yet, had a fair chance of reaching the stage of fruition, for reasons which need not be specially mentioned here. The Queen's Speech, read on Thursday, promises us several Bills, which affect mercantile matters, amongst them being those "for the amendment and consolidation of the laws relating to bankruptcy and patents," for the reform of local and Metropolitan government, for the conservancy of rivers and the prevention of floods. Of these, the most important is unquestionably the Bankruptcy Bill, piloted by Mr. Chamberlain, with the outlines of which the public have already become acquainted. Certain modifications and changes, however, have been introduced since the matter was last before the House of Commons. Assuming that these alterations are in the direction commonly reported, the Bill will, doubtless, command approval, and will, we hope, become law at no distant date. It is understood that a public examination of all bankrupts will be provided for; that an official receiver will be attached to each court to report upon every failure, who will also wind up such estates as the creditors may desire, particularly in suspensions for small amounts; that the discharge of the bankrupt will not be the formality or matter of "arrangement" it now is, but will depend upon the nature of the official receiver's report; that the creditors may themselves deal with the estate if they think fit; that trustees shall not retain the large sums often in their possession, but shall bank them separately and at once; that the accounts of trustees shall be regularly audited, and that their remuneration shall be on a fixed scale; and that all costs shall be duly taxed before the bills are paid. The appointment of trustees will necessarily be a point requiring careful

English and American Jewellery.

This being the commencement of a new business year with us, we beg to thank our many customers for their kind and liberal support during the past, and to assure them that we will endeavour by constantly studying their interests to merit a continuance of the favors so generously bestowed upon us.

Our stock for the coming season will be found well assorted with all Staple Goods, and also with the novelties as they are brought into the market.

As usual our prices will be low and terms liberal.

23 SCOTT STREET, TORONTO.

consideration, unless, as we understand, Mr. Chamberlain has already made up his mind that only members of the Institute of Chartered Accountants shall be deemed eligible for that position. The provision is certainly to be commended, inasmuch as its operation would exclude an outside class of men who have proved the bane of the existing system, whilst the chartered accountants are necessarily respectable and responsible persons. The amendment of the Patent Law is a very desirable matter, but it is of secondary importance as compared with the Bankruptcy bill—hence we trust the latter will be pushed forward and passed without delay.—*The Ironmonger.*

WHAT ARE SUN-SPOTS?

The great atmosphere of the sun, whose breath is flame, is yet, says Mr. Proctor, so cool compared with his intensely glowing surface that it absorbs a large proportion of his light as well as of his heat. But while the general absorptive action of the sun is wonderful, the story is still more wonderful which the spectroscope has to tell about the specific absorptive effects due to its constitution. We find that whereas in our air the vapour of water is present (to condense into water drops and form clouds at certain levels, and to change to ice crystals and form cirrus at high levels), in the sun the atmosphere is laden with the vapours of iron, copper, zinc, sodium, magnesium, and like elements to form clouds of metallic drops, great gatherings of metallic crystals, while the rains that pour down toward the concealed true globe of the sun are mighty showers of molten metal. When a hurricane occurs in the sun, the clouds which form the sun's surface are swept along, or whirled around, not at the rate at which we measure our storms, but with a velocity compared with which their swiftest motion is as rest. The solar tornadoes rage, not over a few hundred square miles, but over regions as large as the whole surface of the earth, over hundreds, even thousands of millions of square miles; and they travel over these enormous regions at a rate not of so many miles per hour or per minute, but of many miles, sometimes more than a hundred miles, in every second of time.

Such storms are in progress now, when we see the spots upon the sun. Such storms tell us of the activity of that great central engine whose throbs are the life-beats of the solar system. We measure the sun's work, per force, by our own forms of work. We speak of his emission of light and heat as corresponding to what would result from the burning of eleven thousand millions of millions of tons of the finest coal in every second of time. But what mind can conceive the real vitality of that mighty orb which seems so silent and so still in our skies? The throbbing of the great engine which beats out light and life to the whole family of planets can only be seen by the mind's eye, and as yet that eye is no more capable of seeing the sun's work as it really is than is the bodily eye of seeing the distant millions of suns which the great gauging telescopes of the Herschels bring within our ken. Nor can the mental ear hearken to the uproar and tumult with which the work of the great central engine is accomplished, or imagine what would be heard if one could visit that spot which looks like a tiny speck on the sun's surface, and, passing below the limits of the solar air so that sound waves could reach him, could find (as assuredly he would if he could live at a temperature which turns the hardest metal into vapour all forms of noise known to us—the roar of the typhoon, the crash of thunder, even the hideous groaning of the earth-throe—surpassed a millionfold by what takes place within every square mile of that disturbed region.—*Ex.*

MINISTERS IN BED.

A Spanish Minister signalized his accession to power by going straightway to bed and staying there, lest he should be expected to do something. No English Minister ever adopted that ignoble expedient to escape performing his duties, but Walpole relates that William Pitt and the Duke of Newcastle once held counsel together in bed. Pitt had the gout, and, as was his custom when so afflicted, lay under a pile of bed-clothes in a fireless room. The Duke, who was terribly afraid of catching cold, first sat down upon another bed, as the warmest place available, drew his legs into it, as he grew colder, and at length fairly lodged himself under the bed-clothes. Somebody coming in suddenly beheld the "two Ministers in bed at the two ends of the room, while Pitt's long nose and black beard, unshaved for some time, added to the grotesque nature of the scene." The Great Commoner was abed and asleep when Wyndham and others of his colleagues burst into his room and shook their chief out of his slumbers to tell him there was mutiny in the fleet, that the Admiral was a prisoner on board his own ship and in danger of death. Sitting up in bed, Pitt asked for pen, ink, and paper, and wrote:—"If the Admiral is not released, fire upon the ship from the batteries," turned over on his pillow, and was asleep again before his disturbers were well out of the room. The shadow of death was upon Fox when George Jackson came for instructions before setting out for Germany, and followed so quickly on the heels of the servant announcing him that Mrs. Fox had only time to slip from her husband's side and take refuge in a closet. The interview proved longer than she expected or desired, and finding her signals of distress, in the shape of sundry little coughs all unheeded, the prisoned lady had no resource but to tap on the closet panels and ask if the young gentleman was going, as she was perishing with cold. Looking at him with a smile, Fox bade Jackson farewell forever, and released his shivering wife from her unpleasant situation.—*Chambers' Journal.*

JOHN HARRISON, THE CHRONOMETER MAKER.

At the Royal Observatory, Greenwich, one of the most remarkable instruments is to be seen—the first chronometer, the parent of a numerous progeny of chronometers, used on board of every sea-going ship, to the advantage of navigation, of commerce, as well as of science. As far back as the reign of Queen Anne, in the year 1714, the English Government offered the large prize of £20,000 to the person who should find the method of discovering the longtitude at sea, within certain specified limits. The reward was offered to the world, to inventors and scientific men of all countries, without any restriction of nation, or race, or language. To the surprise of every one—it was thought remarkable, and it *was* remarkable—the prize was won by a man who had been brought up as a village carpenter, of no school, or college, or university. But the truth is that the great mechanic, like the poet, is born, not made; and John Harrison, the winner of the famous prize, was a born

New York, February, 1883.

The new Price List for complete $\frac{3}{4}$ plate, 8, 14 and 16 size gold watches, issued under date of February 1st, by the American Watch Co., of Waltham, is now ready for distribution. We will forward a copy upon application, accompanied by business card, from any regular dealer in watches.

Jobbers who wish copies sent to their customers will please notify us by sending the names and addresses of the same, but such customers must be regular watch dealers.

We shall take special precaution in the distribution of this list in order to keep it out of the hands of the general public, and we beg to request that the Trade will co-operate with us in this undertaking, it being entirely in their interests.

We also beg to call particular attention to the fact that the cases quoted on this list are entirely of our own manufacture, and that we are directly responsible for the quality of the same. By 18k. or 14k. or 10k. we mean 18k. or 14k. or 10k., and not 16½k. or 12k. or 8k. We offer you honest value for your money.

ROBBINS & APPLETON,

General Agents, 5 Bond Street, NEW YORK.

mechanic. He did not, however, accomplish his object without the exercise of the greatest skill, patience and perseverance. Indeed, his life, so far as we can ascertain the facts of it, is one of the finest examples of difficulties overcome, and of undaunted perseverance eventually crowned by success, in the whole range of biography.

No complete narrative of Harrison's career was ever written. Only a short notice of him appears in the "Biographica Britinnica," published in 1766, during his lifetime—the facts of which were obtained from himself. A few notices of him appear in the "Annual Register," also published during his lifetime. But no life of him has since appeared. Had he won battles by land or sea, we should have had biographies of him without end. But he pursued a more peaceful and industrious course. His discovery conferred an incalculable advantage on navigation, and enabled innumerable lives to be saved at sea; it also added to the domains of science by its more and exact measurement of time. But his memory has been allowed to pass silently away, without any record being left for the benefit and advantage of those who have succeeded him. The following memoir includes nearly all that is known of the life and labours of John Harrison.

He was born in Foulby, in the parish of Wragby, near Pontefract, Yorkshire, in May, 1693. His father, Henry Harrison, was carpenter and joiner to Sir Rowland Wynne, owner of the Nostel Priory estate. The present house was built by the baronet on the site of the ancient priory. Henry Harrison was a sort of retainer of the family, and he long continued in their service.

Little is known of the boy's education. It was certainly of a very inferior description. Like George Stephenson, Harrison had always a great difficulty in making himself understood, either by speech or writing. Indeed, every board-school boy receives a better education now than John Harrison did a hundred and eighty years ago. But education does not altogether come by reading and writing. The boy was possessed of vigorous natural abilities. He was especially attracted by every machine that moved *upon wheels*. The boy was thus "father to the man." When six years old, and lying sick of small-pox, a going watch was placed upon his pillow, which afforded him infinite delight.

When seven years old he was taken by his father to Barrow, near Barton on-Humber, where Sir Rowland Wynne had another residence and estate. Henry Harrison was still acting as the baronet's carpenter and joiner. In course of time young Harrison joined his father in the workshop, and proved of great use to him. His opportunities for acquiring knowledge were still very few, but he applied his powers of observation and his workmanship to the things that were nearest him. He worked in wood, and to wood he first devoted his attention.

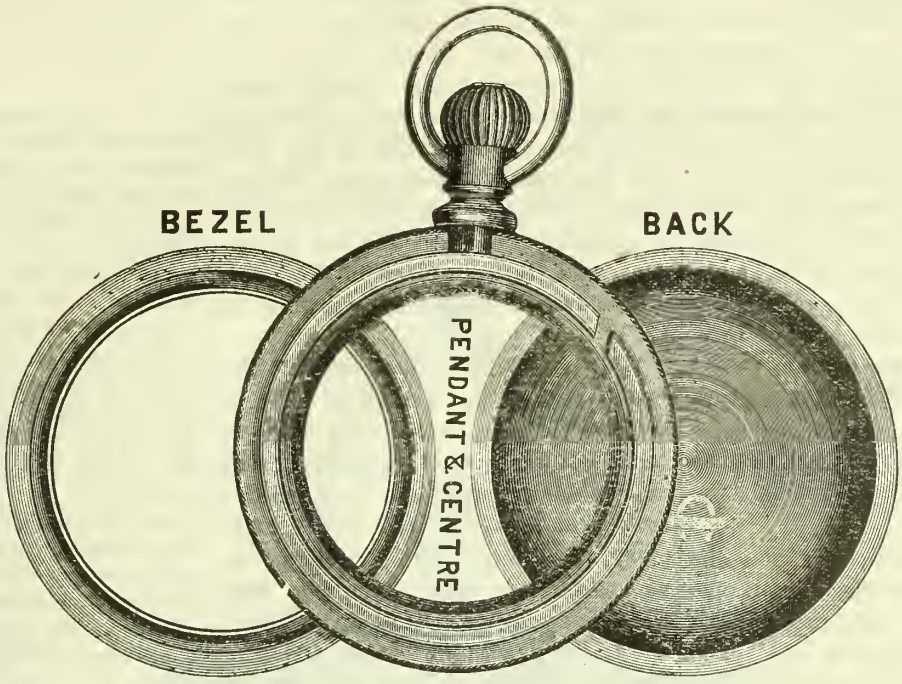
He was still fond of machines going upon wheels. He had enjoyed the sight of the big watch going upon brass wheels when he was a boy; but, now that he was a workman in wood, he proposed to make a time-keeper with wheels of that material. After many difficulties—and nothing can be accomplished without them—he succeeded in making a wooden clock, with wheels of wood. This, however, was only a beginning. He proceeded to make better clocks; and then he found it necessary to introduce metal, as being more lasting. He made pivots of brass, which moved more conveniently in sockets of wood, with the use of oil. He also caused the teeth of his wheels to run against cylindrical rollers of wood, fixed by brass pins, at a proper distance from the axis of the pinions; and thus to a considerable extent he removed the inconvenience of friction.

In the meantime Harrison eagerly improved every incident from which he might derive further information. There was a clergyman who came every Sunday to the village to officiate in the neighborhood; and having heard of the sedulous application of the young carpenter, he lent a manuscript copy of Professor Saunderson's discoveries. The blind professor had prepared several lectures on natural philosophy for the use of his students, but they were never intended for publication. Young Harrison now proceeded to copy them out, together with the diagrams. Sometimes, indeed, he spent the greater part of the night in writing or drawing.

As part of his business, he undertook to survey land, and to repair clocks and watches, besides carrying on his trade of a carpenter. He soon obtained a considerable knowledge of what had been done in clocks and watches, and was able to do not only what the best professional workers had done, but to strike out entirely new light in the clock and watchmaking business. He found out a method of diminishing friction by adding a joint to the pallets of the pendulum, whereby they were made to work in the nature of rollers of a large radius, without any sliding, as usual, upon the teeth of the wheel. He constructed a clock upon the recoiling principle, which went perfectly and never lost a minute in fourteen years. Sir Edmund B. Denison says that he invented this method in order to save himself the trouble of going so frequently to oil the escapement of a turret clock, of which he had charge; though there were other influences at work besides this.

But his most important invention, at this early period of his life, was his compensation pendulum. Everyone knows that metals expand by heat and contract by cold. The pendulum of the clock therefore expanded in summer and contracted in winter, thereby interfering with the regular going of the clock. Huyghens had by his cylindrical checks removed the great irregularity arising from the unequal lengths of the oscillations; but the pendulum was affected by the tossing of a ship at sea, and was also subject to a variation in weight, depending on the parallel of latitude. Graham, the well-known clockmaker, invented the mercurial compensation pendulum, consisting of a glass or iron jar filled with quicksilver and fixed to the end of the pendulum rod. When the rod was lengthened by heat, the quicksilver and the jar which contained it were simultaneously expanded and elevated, and the centre of oscillation was thus continued at the same distance from the point of suspension.

But the difficulty, to a certain extent, remained unconquered until Harrison took the matter in hand. He observed that all rods of metal do not alter their lengths equally by heat, or, on the contrary, become shorter by cold, but some more sensibly than others. After innumerable experiments, Harrison at length composed a frame somewhat resembling a gridiron, in which the alternate bars were of steel and of brass, and so arranged that those which expanded the most were counteracted by those which expanded the least. By this means the pendulum contained the



The "Excelsior" Patent Dust Proof Case.

PATENTED,

United States,

27th December,

1881

PATENTED,

Dom. of Canada

28th February,

1882.

This is the first and only case made without one grain of solder. Every piece is cut from the solid metal and pressed into the shape used in the case. This process hardens the gold and silver by the only method known (that is to work it), and is handed to the Trade as hard as is possible to make it, being a great advantage over a case made in the ordinary way, in saving gold and silver by making a case as strong as a much heavier one that has been softened as heat does in soldering on pendant, joints, thumb catches, or joint to swing movement in. Heat not only softens the gold or silver, but warps it out of the shape that the snaps have been fitted to, and it is never perfect after soldering. The Excelsior Patent Dust Proof is never soldered, never heated, is fitted perfectly, and remains perfect. The Excelsior Dust Proof has no joints to wear out or break off. The Excelsior Patent Dust Proof has no spring to break or wear the case. There is no part of the Excelsior Patent Dust Proof that will wear. The Excelsior Patent Dust Proof is the safest case made for protecting the movement—it will never open in the pocket Put an Excelsior Dust Proof in your pocket, bend forward, backward, put yourself in any position you please and the Excelsior is closed tight. In an ordinary case, with springs, by bending forward the case will often open and when the lock-spring is worn, the case is nearly always open.

The Excelsior Patent Dust Proof Case is the strongest, best fitting and most durable case made. Ask your Jobber for the Excelsior Patent Dust Proof. Every case warranted as stamped, 18 kt., 14 kt., 12 kt., 10 kt., United States Mint Assay or Coin Silver, as may be stamped, and every genuine case bears the Trade Mark. The Excelsior Patent Dust Proof Case may be obtained from any of the jobbing houses in the country.

Trade Mark.

Instructions to Open the Excelsior Patent Dust Proof Case.

First press the crown as in opening an ordinary Hunting Cased Watch, then to open front, turn bow to the right with thumb and finger; to open the back, turn left. To close, turn case back in same position as when case was closed, and snap same as glass bezel on any watch.

power of equalizing its own action, and the centre of oscillation continued at the same absolute distance from the point of suspension through all the variations of heat and cold during the year.

Thus by the year 1726, when he was only twenty-three years old, Harrison had furnished himself with two compensation clocks, in which all the irregularities to which these machines were subject, were either removed or so happily balanced, one metal against the other, that the two clocks kept time together in different parts of his house, without the variation of more than a single second in a month. One of them, indeed, which he kept by him for his own use, and constantly compared with a fixed star, did not vary so much as one minute during the ten years that he continued in the country after finishing the machine.

Living, as he did, not far from the sea, Harrison next endeavored to arrange his timekeeper for the purposes of navigation. He tried his clock in a vessel belonging to Barton-on-Humber; but his compensation pendulum could there be of comparatively little use; for it was liable to be tossed hither or thither by the sudden motions of the ship. He found it necessary, therefore, to mount a chronometer or portable timekeeper, which might be taken from place to place, and subjected to the violent and irregular motion of a ship at sea, without affecting its rate of going. It was evident to him that the first mover must be changed from a weight and pendulum to a spring wound up and a compensating balance.

He now applied his genius in this direction. After pondering over the subject in his mind, he proceeded to London in 1728, and exhibited his drawings to Dr. Halley, then Astronomer Royal. The Doctor referred him to Mr. George Graham, the distinguished horologer, inventor of the dead-beat escapement. After examining the drawings, and holding some converse with Harrison, Graham perceived him to be a man of uncommon merit and gave every encouragement. He recommended him, however, to make his machine before again applying to the Board of Longtitude. He accordingly returned home again to Barrow to complete his task, and many years elapsed before he again appeared in London, to present his chronometer.

The remarkable success which Harrison had achieved in his compensating pendulum could not but urge him on to further experiments. He was no doubt to a certain extent influenced by the reward of £20,000 which the English Government had offered years before for an instrument that should enable the longtitude to be more accurately determined by navigators at sea than was then possible; and it was with the object of obtaining pecuniary assistance to assist him in completing his chronometer that Harrison made his first visit to London to exhibit his drawings in 1728.

The Act of Parliament offering this superb reward was passed in 1714, in the twelfth year of the reign of Queen Anne. It was right that England, then rapidly advancing to the first position as a commercial nation, should make every effort to make navigation less hazardous. At that time the ship, when fairly at sea, out of sight of land, and battling with the winds and tides, was in a measure lost. No method existed for accurately ascertaining the longtitude. The ship might be out of its course for one or two hundred miles, for anything that the navigator knew; and only the wreck of his ship on some unknown coast told of the mistake which he had made in his reckoning.

(To be continued.)

BUSINESS CHANGES FOR MARCH.

Jackson & McFarlane, hardware, Nelson, Man., assigned; F. E. Hatch, hardware, Exeter, Ont., removed to Waterford and bought out E. H. Jeeves; Doherty & Silvester, hardware, Stouffville, Ont., dissolved, Silvester retiring, Doherty continues alone; H. Davis & Son, jewelers, London, Ont., have sold out the St. Thomas branch of their business; J. W. French, jeweler, Hamilton, assigned; Bullock Manufacturing Co'y, hardware, Otterville, Ont., burned out; J. D. Wetherall, tins, Otterville, burned out; G. H. White & Co., hardware, Orillia, dissolved, E. A. Gilpin retires and G. H. White continues alone; McGregor Bros., hardware, dissolved, W. S. McGregor continues alone; Baird & Luxton, hardware, Ridgetown, dissolved, C. Luxton continues alone.

BUSINESS NOTES.

Mr. S. T. Culp is back again from Europe looking fresher and brighter than ever.

Mr. Henry Smith and wife, of this city, sailed for England last month. We wish them *bon voyage.*

Mr. Frank Laidlaw, formerly traveller for Smith & Fudger, is now performing a like engagement with C. & J. Allen of this city.

The latest thing they say in gentleman's jewelry is the "Freddy Gebhart" scarf pin. It is in the form of a golden donkey with brass cheeks. Next.

We regret to learn that Mr. L. Davis, the the well-known jeweler of Montreal, lately lost his wife after a short illness. Mr. Davis has the sympathy of the trade in his sad bereavement.

It is not generally known that Canada's champion skater, Mr. Robinson, is a jeweler doing business on Yonge Street, of this city. Such is the fact, however, and we are glad to be able to say that Mr. Robinson is not only Canada's champion skater, but one of the best and most skillful workmen in this city. We wish him success.

Messrs. J & J Taylor, the well-known safe manufacturers of Toronto, are hard at work rebuilding their factory. It will be the largest and most complete of its kind in Canada, and double its former capacity. People wanting safes should send in their orders as soon as possible.

We are in receipt of a letter from Mr. D. Manson, dated from the "Eternal City," in which he describes his tour through England, Ireland, Scotland, France, Germany, Austria, Belgium and Italy. He purposes visiting Egypt, Palestine and India before going to Australia.

Removal.—We are glad to notice that Messrs. T. White & Son, lapidaries, of this city, have, on account of their growing trade, been forced to remove to larger and more commodious premises. The trade seem to appreciate the advantage of having a firm of practical lapidaries in this country, and we trust that their business will be better than ever in the new quarters.

Malicious Report.—We understand that reports are being circulated to the effect that the firm of A. C. Anderson & Co., of Hamilton, have been mixed up in some way with the recent Customs seizures made in that city. We are pleased to say, we have the best authority for stating that they were in no way implicated in them, and the reports are entirely false. We understand that Messrs. Anderson & Co. have entered proceedings against the parties by whom the reports were circulated.

Hagstoz & Thorpe are out with a very good advertising puzzle in the shape of a keystone and letter C made up of over eighty small letters. After considerable puzzling we managed to "solute" it. It runs as follows:

"A case to last
Should be of proper make,
Who wants the best one,
Should the Keystone take."

As the boys say, give us a hard one next time.

In spite of the abundant sleighing, the winter trade of our jewelers has scarcely been up to the mark it was expected to reach. In fine colored gold goods has this especially been the case. It is to hoped however, that the spring trade will more than make up for the deficiency of the winter trade, and that our friends throughout may be able to "level up," if not more so before the year closes. The prospects ahead are good.

Says as an exchange, "Ever since the

FACTORIES: WALLINGFORD CONN., U.S. AND MONTREAL, CANADA.

Sidney and Melbourne Exhibitions, the American Watch Company has been doing agood trade with the Australian Colonies, and it has now attained such large proportions as to necessitate the opening of a branch establishment at Melbourne. The Melbourne branch will no doubt be carried on with the same energy and spirit which so rapidly developed the business in this country: in fact, as far as we are concerned, we feel quite sure of it, as the manager selected for the new establishment is Mr. D. Manson, who so ably represented the Company at the Australian Exhibitions.

In the case of Zimmerman, McNaught & Lowe v. The Canada Sterling Co., (Mrs. A J. Parker,) Judge Burnham gave a verdict in favor of the plaintiffs for $136 and costs. This case arose out of a balance of account due the plaintiffs from the defendant on account of defective goods of their manufacture being returned to them. This balance the defendant admitted, and promised to settle for at the time it was made, but was afterwards repudiated, hence the action.

Mr. John W. Campbell, formerly bookkeeper for Zimmerman, McNaught & Lowe, the well-known wholesale jewelers of this city, has gone on the road for that firm, and will take the towns situated on the Northern, Wellington Grey & Bruce and Grand Trunk (west) Railroads. The trade will find Mr. Campbell an honest, courteous and obliging salesman, and we predict for him a good business and a successful career in his new sphere.

Messrs. W. A. Fowler & Co., of Winnipeg jewelers have lately assigned under very questionable circumstances. We understand that some of their Ontario creditors intend pushing the case as far as the law will allow, and that some interesting developments may be expected. We refrain from saying any more about this case until the result of present investigations are known, and if the facts are such as we suspect we shall have no hesitation in ventilaiing the matter thoroughly.

Says an exchange, "A deputation lately waited on the Hon. L. S. Tilley, Minister of Finance, to ask that the Excise duty on tobacco be reduced from 20 cents to 10 cents per pound in order to prevent smuggling." We don't know what answer this deputation got, but if there is any force in the above contention as regards a bulky article like tobacco, it applies with a hundred times more force to small and valuable goods like jewelry. A man can just as easily smuggle $1,000 worth of jewelry, on which the government lose $200 of duty, as he could one pound of tobacco, the value of which is no more than $1, and the loss of revenue to the government at most 25 cents. This fact is patent to every one but Government officials, who still wonder at the crime of smuggling.

We are often asked by readers about the quality of the Swiss imitation American movements with which the country is being flooded. Our observation leads us to conclude that they are a very poor substitute for the goods they imitate, or even for the ordinary Swiss detached lever now so well-known to the trade. A good detatched lever is a good watch, and will give the buyer satisfaction, and be value for his money, but the abortion of a movement that is at present being sent into this country by Swiss manufacturers under American names are a humbug of the most transparent kind. These movements, especially of the cheaper grades, are roughly finished, in many cases what jewels there are are only on the top plate, and only temporarily fastened in, and although some of these may go for weeks they will very soon cost the owner more to keep them going than would buy a good Swiss lever or a real American watch. They may do well enough for a peddling trade, but we would not recommend any local jeweler who values either his reputation or ultimate peace of mind to sell them without giving the purchaser a written guarantee that they are an imitation article, and warranted to cost him more than their original cost every year for repairs. Having thus delivered ourselves, our readers may do as they like about selling them.

It is absolutely necessary for the safety of his stock that every jeweler should have a first-class safe placed in a part of his store where it can be always seen from the street, and that at night a strong light be left burning close to it. The want of such precautions has often ended in jewelers getting their stock thoroughly cleaned out some night by "the enterprising burglar," and then after his property is all gone setting to work to secure their treasures in thoroughly burglar-proof safes. In reference to this state of things an exchange says: "Burglar-proof safes are becoming more and more serviceable as adjuncts of office ornamentation. They are not an unqualified success, however, for any other purpose, noticeably the purpose for which they are supposed to be constructed. J. C. Ratoll, of Springfield, is in a position to witness to the above. His safe was lately relieved of 400 gold watches. Owners of safes would do well to copy the example of some merchants who invariably make it a practice to leave nothing in the safe and its doors wide open, or of others who carefully write out the combination and hang it in a conspicuous place with the request to burglars, 'Please use the combination.' In this way they would save their vaulables and their safe." We differ with our contemporary, because we fancy that if Mr. Ratoll had owned one of J. & J. Taylor s burglar-proof safes he might have gone to bed and snapped his fingers at their efforts to rob him. We know of Canadian jewelers who don't own a safe at all, and we think the sooner they invest in one the better for themselves.

The Australians are thinking over the *pros* and *cons* of confederation. The proximate cause of the movement in that direction was the Egyptian war. The war, and other wars perhaps to arise out of it, may not be prolonged so as to overtax the powers of England, but then again they may; and a chivalrous spirit has infused itself into the Australians—a willingness to assume the expense of her own naval defences in case England may find it a burden—and to this end, a confederation. The manifest advantages of Confederation, however, have always been seen by the Australians, and Union is sure in the end to come. The agitation has commeuced in Victoria. Mr. Munro, of North Melbourne, has moved in the Assembly for a conference of the representatives of the different Governments of all the Australian Colonies to discuss the propriety of securing a federal union of the colonies. Taking Canada as his example, he pointed out all the advantages that have accrued to us from Confederation, and predicted the same for the Australian Colonies. It was objected that the movement was premature, that Victoria would be left in a minority on the tariff question. Many others spoke, most of them favouring the original motion, and the debate was then adjourned, but only for a week. Now that the people have become fully permeated with the spirit of Confederatiou, the difficulties that look large will probably be smoothed away, and the *non posumus* argument disposed of.

WORKSHOP NOTES.

Another mixture for wax patterns, is composed of 2 parts of yellow wax and 1 of resin.

A mastic for filling small holes in wooden patterns is composed of 50 parts resin, 40 whiting, 7 tallow, and 3 yellow wax.

Water is not the only substance which expands in solldifying; tin, zinc, bismuth, antitomy, iron and copper exhibit the same property. With lead and cadmium the results are indecisive.

If very uudercut plaster patterns are covered with very strongly rammed sand in metallic casks, they may be easily destroyed by calcining the whole to the point when the plaster will fall into powder.

A good rivet, cold, should bend double without breaking. The head should flatten out, wheu hammered hot, to ⅛ inch thick, without fraying at the edge or breaking. Boiler plates should be calked with a convex tool.

A German paper says that a roof can be made fire-proof by covering it with a mixture of lime, salt and wood ashes, adding a little lamp-black to give a dark color. This not only guards against fire, it is claimed, but also in a measure prevents decay.

A new method of tempering steel has been published by M. Clemandot. The metals are heated to a cherry red and then compressed strongly until they are cool. The result is great hardness and an exceedingly fine grain. Steel thus treated makes excellent permanent magnets.

Soldering cast iron, says the *Engineer*, is geuerally considered to be very difficult, but it seems to be only a question of thoroughly making bright the surface to be soldered, and using good solder and a clean swab with muriatic acid. Sodium amalgam might be usefully employed for the purpose.

To Recut Files and Rasps.—To recut by a chemical process dissolve 4 ounces saluratus to one quart of water, sufficient to cover the files, and boil them in it for half an hour; then take out, wash and dry them; then stand them in a jar, fill it up with raiu water and sulphuric acid in the proportion of 1 quart water and 4 ounces acid.

To keep machinery from rusting take one-half ounce of camphor, dissolve in one pouud of

MARK.

OBSERVE

this Trade Mark is stamped on all Knives, Forks, Spoons and other flat ware of our manufacture.

The A 1 Goods are Standard Heavy Plate, and XII signifies that in addition the articles have an extra quantity of Silver on all the parts most exposed to wear.

The Meriden Britannia Company have been awarded the highest premiums wherever exhibited, from the WORLD'S FAIR, 1863, to the PRESENT TIME, and the high reputation of our Goods throughout the world has induced other makers to imitate our Trade Marks and name as well as our designs, and as many of our patrons have, through a similarity of names, purchased inferior goods under the impression that they were our manufacture, we are compelled to ask especial attention to our Trade Marks.

THE FACT THAT OUR NAME AND TRADE MARKS ARE BEING SO CLOSELY IMITATED SHOULD BE A SUFFICIENT GUARANTEE TO THE PUBLIC THAT OUR WARES ARE THE BEST IN THE WORLD.

WE RE-PLATE OLD WORK AND MAKE IT EQUAL TO NEW.

melted lard; take of the scum and mix it with as much fine blacklead as will give it an iron color. Clean the machinery and smear with this mixture After twenty-four hours rub clean with a soft linen cloth. It will keep clean for months under ordinary circumstances.

Galvanized iron is iron covered with zinc in a zinc bath. Formerly it was covered by the aid of electricity, created by a galvanic battery, but lately is covered with zinc in the same manner that tinned iron is made, still keeping its old name. Zinc will corrode underneath paint, and form zinc oxide, a white powder, which loosens the zinc and it drops off.

Re-heating and rolling down or forging down wrought iron bars reduces their elongation and increases their tensile strength. The skin of wrought iron is *not* the strongest portion. Cold rolling increases the strength of wrought iron. Tensile strength of wrought iron averages ten per cent. more with the fiber than across it. Compressing melted steel with a pressure of about six tons per square inch increases its strength.

Every boiler should be protected from the weather. It often occurs that boilers have no other protection than simply a loose board roof, which in ordinary rain storms leaks at every point. If the boilers were always under steam, the bad consequences would be comparatively light, but the great mischief occurs when the boilers are cold. Whenever rust appears on the surface of a boiler it means loss of iron and strength, and consequently is less able to withstand high pressure.

It is said that those who wish to do any painting on or about their mills, will find the following an excellent and cheap recipe, which will last much longer than any ordinary whitewash: Three hundred parts washed and sifted white sand, forty parts precipitated chalk, fifty parts of resin and four parts linseed oil are mixed and boiled in an iron kettle, and then one part of oxide of copper and one part of sulphuric acid are added. This mass is applied with an ordinary paint brush while warm. If it is too thick, it is diluted with linseed oil. This paint dries very rapidly and gets very hard, but protects the wood excellently.

SCIENCE NOTES.

On the 1st of next August an International electric exhibition will be opened at Vienna, and a fine display is anticipated.

An apparatus for recording the exact speed of a train during its entire run, including stoppages and startings, has been invented by M. Pouzet.

In the united states last year the Bessemer steel ingot product reached 1,696,450 tons, or an increase of 10 per cent. over the year immediately preceding.

The Italian Government have begun to substitute bronze for the steel guns now used for field artillery, mainly because bronze can be more easily worked.

A contemporary advocates the use of wind engines in new countries where prospecting operations are necessary before deciding where to sink the permanent shafts.

It is said that steam and air-tight rubber packing may be made by brushing it over with a solution of powdered resin in ten times its weight of water. The packing is ready in about four weeks.

In Great Britain the large sum of $40,000,000-000 is invested in railways. Some of the engines weigh 45 tons, and take a load of 90 tons at a speed of from 40 to 50 miles an hour.

Bordeaux red is a new colouring matter for wine. It appears to be a napthaline dye. Its presence in wine can be very easily detected. Silk is turned by it to a granite red, and the addition of a little ammonia makes the doctored wine brown.

A strong infusion of sassafras root is recommended by Dr. Hinton as a powerful remedy for poisoning by *Rus toxicodendron*. When it is cool cloths are wet in it and applied frequently to the patient. A day's treatment will effect a cure usually.

The report from England of the discovery of a cheap method of extracting aluminium may be the precursor of a violent change in many established trades. Aluminium is one of the metals most abundant in nature. Common clay has for its basis alumina or oride of aluminium. Nothing but the costliness of its manufacture has prevented this metal from displacing silver for many purposes. Alumiuium in not affected in any way by exposure to air. It is lighter than silver, harder, can be rolled to a wonderful degree of thinness, or drawn into the finest of wire. It combines readily with copper, iron or silver, forming alloys of great hardness and durability. As a metal of coinage purposes in the lower denominations aluminium possesses many advantages over silver, nickel, copper, bronze, or any combination. The manufacturing world will wait with interest for further particulars of this discovery. It is likely that a great field for cheap aluminium would be found among the stove-founders. The tarnishing of the nickel ornaments now used in such great quantities is a serious trouble to the housewife, who would hail with delight the introduction of some stove decorations which would want less attention.

The Watchmaker, Jeweller and Silversmith,

A Monthly Illustrated Journal. Published in London.

The Representative Organ of the Watch, Jewellery and Kindred Trades in the United Kingdom.

It is full of original information and thorough practical instruction contributed by the leading writers on the various subjects connected with the above trades. The text is well illustrated by wood-cuts, and two supplements of artistic designs for jewellery, etc. accompany each number.

This important Trade Organ, now in its seventh year of publication is in the hands of every British Watchmaker, Jeweller and Silversmith, and is therefore a most valuable medium for manufacturers requiring publicity in Great Britain.

Our list of permanent contributors includes such names as: J. U. Poole, Richard Whittaker, Henry Ganney, Moritz Grassmann, J. Herrmann, E. J. Watherston, W. H. Singer, an ample guarantee for the sterling value of the journal. Subscription 5s. per annum.

Published by A. FISCHER, 11 Saint Bride Street, London, E. C., England.

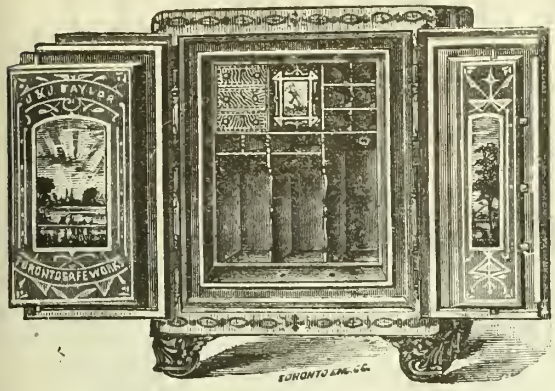
THE LARGEST

Clock House

IN CANADA.

I hope the Trade are convinced by this time that the above clock house has got the best assortment and better value than any other house in the Dominion.

I thank my many friends for their kind patronage in the past, and solicit a continuance of the same.



I have just returned from the eastern States and have imported a large stock of Walnut and Nickel Clocks, which I will sell at prices that defy competition. Also receiving daily Jewelry of all kinds. Roll Plate Chains a specialty. Large stock of Swiss Watches in Gold, Silver and Nickel Cases, key and stem winders. The best value in Whitby Jet Goods, such as Bracelets, Necklets, Sets Earrings, etc., which I will cut low prices to the Trade only.

Orders by mail promptly attended to.

SAMUEL STERN,

Wholesale Agent for the Seth Thomas, Welsh, Ansonia and Ingram Clock Co.'s

31 Wellington, 40 Front St. E., Toronto.

J. & J. TAYLOR,

TORONTO SAFE WORKS.

Patentees and sole manufacturers of Taylor's patent Fire-proof Safes with

Non-Conducting Steel Flange Doors.

ALSO MANUFACTURERS OF

Burglar Proof Safes, Vaults, Vault Doors, Bank Locks, Combination Locks, Prison Locks and all Kinds of Fire & Burglar-Proof Securities.

20 YEARS ESTABLISHED.

The Oldest and Most Reliable Safe Manufacturing Firm in the Dominion.

A. C. ANDERSON & CO.

NEW GOODS! NEW GOODS!! NEW GOODS!!!

Our Spring Stock is now complete in every department. We have just received large consignments of the following:

LADIES' SWISS GOLD WATCHES. **GENT'S SWISS CHRONOGRAPHS.**
LADIES' AMERICAN GOLD WATCHES. **ENGLISH GEM RINGS.**
GENT'S AMERICAN GOLD WATCHES. **AMERICAN CHARMS, LOCKETS, &c.**

Editorial.

CREDIT.

It has often been said that credit is too cheap in this country, and this is probably true enough if the failures are any proof of the assertion. Be this as it may, however, one thing is certain, viz. : that if wholesale merchants were more strict in getting reliable reports of their customers' standing and ability to pay before they sold them, although it might reduce the volume of their business for awhile, they would find themselves much better off in the long run.

As a rule most merchants do get reports of new customers, but these reports, although bought and paid for in the regular way at the "character shops," are not always reliable, and should never be wholly depended upon.

In our idea one of the best things that any wholesale merchant can do, and one that he certainly should do, is to apply to the customers themselves for a statement of their own affairs, and a *bona fide* report of their standing and prospects.

This is a very common practice in England and the United States, and in both of these countries it has been found to work well both for the buyer and seller. Certainly no one knows or ought to know so well as a man himself how his own business affairs stand, and if he can give a merchant a good statement, and satisfy him that his position is sound, he may make up his mind that he will have a good treatment in every way from the wholesale dealer as any one else.

As a rule these personal statements are honest statements, and show the giver's affairs in about as true a position as can possibly be ; and it is for this reason that such reports are valuable as a basis of credit.

Of course there are exceptions to this as to every other rule, but the exceptions are generally those who lay themselves out to deliberately cheat their creditors, and these prove the correctness of the rule.

We have been told by wholesalers that they have experienced considerable difficulty in getting statements from customers of their standing. Some refuse such a request point blank, others promise it and never fulfil their promises, while others treat the request with silent contempt.

We think if retailers fairly realized how much good they might do themselves by a full and frank conference with the houses from whom they buy, they would if all right, have little or no hesitation in acceding to such a reasonable request.

What can be more reasonable than for any person who is going to sell another a lot of goods on long credit to endeavor to get accurate information as to his standing, and if he asks the purchaser what prospects he has of paying for them when the bill is due, no one should think it either insulting or unreasonable.

The wholesale merchant, when he goes to the foreign or home manufacturer to buy his goods, has first to satisfy them that he is fully worthy of credit. This is the preliminary to actual business, and unless he can do this satisfactorily, no sale is either attempted or made. An English or American house that was refused such information from a wholesale importer that was asking credit from them would at once catalogue him as having something to conceal, and therefore unworthy of credit, and this is the natural inference of any wholesale merchant when such information is refused by a retail customer.

If a merchant has nothing to conceal, an honest, above-board explanation of his affairs with the houses from whom he buys can do him no possible harm, but on the contrary must establish his credit on a firmer basis than ever.

It is plainly then in the interest of wholesale and retail merchants alike that when asked for these necessary statements, the enquiries should be met in a fair and honorable spirit, and receive such treatment as they would themselves wish to receive were their place changed with the wholesale dealer or manufacturer.

It is only by a mutual confidence that a safe credit business can be done, and we know of no better way of strengthening this feeling of trust than yearly statements shewing the position and the tendency of business.

If satisfactory no one can object, if unsatisfactory the sooner it is known the better, for then the customer will often get the advice and aid of persons of more experience than themselves, and at a time when it most worth having.

JEWELRY AND THE TARIFF REVISION.

The budget speech of the Minister of Finance, while on the whole a good and statesmanlike production, is in some respects unsatisfactory and illogical. The present tariff, as every one knows, was never intended to be a permanent one, but was intended to rise and fall as the necessities of trade and the production of the home manufacturer seemed to demand. To some departments of manufacture the Minister of Finance seems to have lent a particularly kindly ear, as they have fared well and got all they wanted. Others have got some slight measure of the relief they craved, while others again have got nothing at all.

In the first class the manufacturers of Snuff and Tobacco stand out as prominent examples. In reference to the reduction of the duty on these goods Mr. Tilley in his budget speech said, (the italics only are ours): "Tobacco and Snuff, the specific duty is reduced from 25 to 20 cents per pound, and I may state here, although this matter is on another paper, still I may refer to it here, owing to the fact that the United States have reduced the excise duty on tobacco and snuff from 16 to 8 cents a pound, the Government found it an absolute necessity for many reasons, though there are other articles on which they would rather relieve the people from taxation, *in order to prevent smuggling into the country, which would certainly have occurred if the present rate of excise duty was left at 20 cents a pound, while the American duty was 8 cents, to reduce the duty to 12 cents a pound, so as not to encourage smuggling and the closing up of*

our manufactures, which would effect our revenue very materially, and consequently we thought it desirable to ask Parliament to reduce our duty on tobacco made from foreign leaf from 20 to 12 cents, and from Canadian leaf from 8 to 2 cents; and as the amount obtained from Canadian tobaccos is small, we propose to make the rules and regulations such as will be acceptable to those who are interested in that particular industry."

The above extract is interesting as shewing what a paternal interest our Finance Minister takes in tobacco and snuff factories, and speaks strongly for his kindness of heart, if not for his soundness of head. That there is the slighest danger of our tobacco factories being closed up on account of smuggled tobacco flooding this market we do not for one moment believe, but Mr. Tilley had to give some reason for reducing the excise duty on tobacco and snuff, and the above nonsensical one was probably better than none. We stated last month that tobacco was of little value compared with its bulk, and therefore not a likely article to be a favorite commodity for smugglers. As a rule these individuals prefer articles of small bulk and much value in preference to such goods as tobacco, sugar and cheap groceries. If the Minister of Finance's logic is good for tobacco how much better it would be for jewelry, a trade that everyone knows, who understands anything about it at all, that is having its vitals eaten out by this very crime of smuggling, a crime called into existence very much by the action of the present Minister of Finance, and kept alive almost entirely by his obstinacy in refusing to make the change desired by the trade. A box of tobacco weighing about ten pounds, and worth say ten dollars, if it was smuggled in could only net the smuggler a gain of say three dollars, the amount of the duty that the Government would levy on that particular quantity of the article. A parcel of jewelry however of the same bulk, and little or no more weight, and just as easily smuggled, would be worth at least one thousand dollars if plated, and two thousand dollars if gold goods. On these goods the duty would be from two hundred to four hundred dollars, as the case might be, and this amount would represent the gain the smuggler would stand to make if he carried the operation successfully through. Now does any sane person for one moment think that people will attempt to smuggle such goods as tobacco through in order to save a paltry three dollars, when they can with no more risk turn their attention to goods which are much more easily manipulated and gain by the same efforts from two to four hundred dollars. The Finance Minister would have people believe that smugglers pursue their calling for the love of it. We certainly think this would be the case did they go in for smuggling tobaccos and such like goods in preference to jewelry.

As a rule people smuggle to make money. The higher the duty and the less bulky the goods the better it pays, and *vice versa*. Smugglers are not fools—they can gauge the risk more accurately than outsiders, and the gains equally as accurately. To say, as our Finance Minister virtually does, that these shrewd lawbreakers will knowingly smuggle such goods as tobacco in preference to jewelry is, to say the least, the veriest nonsence. If Sir Leonard Tilley's argument is tenable at all, and the tobacco trade is in the slightest degree endangered by smuggling, how much more forcibly do all his arguments apply to the jewelry trade.

The jewelry trade is not only threatened by smuggling, but is almost ruined by it. It is not imaginary evil that may be reasonably looked forward to, but a present and incontrovertable fact. Jewelry smuggling exists not because of the "grace of God," but by the "grace of our Minister of Finance," for by refusing to lower the present high rate of duty on these goods, he makes it worth their while to pursue their dangerous trade.

While not a silent partner in their business, he is decidedly an accessory before the fact, for it is entirely by his refusing to lower the duty that they are enabled to make money by smuggling.

We suppose that we should be thankful for small favors in the direction we have indicated above. Last year it was clock springs on which the duty was reduced, this year it is precious stones *unset*, uncut they are admitted free, cut they have to pay ten per cent. instead of twenty as formerly.

Probably the Finance Minister fancied that the jewelry trade would not be able to stand a sudden reduction and consequent protection from smuggling all along the line at once, and therefore resolved to give it to them in homœopathic doses, if so he has succeeded admirably. If not, the sooner he awakes to the absurdity of his position and grants the trade the measure of relief it is entitled to, the better for the prospects of the jewelry business in this country. As matters stand at present probably not more than one-half of the jewelry brought into Canada pays duty. Of American goods this is notoriously the case, and as our jewelry manufactures are principally imitations of American goods, the present twenty per cent. tariff is worse than none at all.

If Sir Leonard Tilley would just substitute jewelry for tobacco and snuff in the extract we have made from his budget speech and tariff revision (leaving out the part where it stated that there would be a considerable loss to the revenue) he would not only state a business fact, but afford relief to a branch of business that has for years suffered more than any other from the injustice of the present tariff.

ENGLISH vs. AMERICAN PATENTS.

Probably no country in the world is so fruitful of inventions as the United States of America. Not that we think that the American people as a whole are any better or any smarter than other nations, but that their patent laws are so framed as to make it worth while to protect even the smallest inventions or improvements. In England it costs about $775.00 to get out a patent, while in the United States the same thing is effected for the trifling sum of about $35.00. The result of such a terrible discrepancy has been to discourage the patenting in England of all but great inventions that represent large sums of money, while in the States the effect has been to stimulate the invention, and introduce numberless small contrivances for household convenience, in addition to the more important inventions. Moreover the English inventor, even after paying the exorbitant sum demanded by the English patent laws, has still to take the patent at his own risk, and should it be found to be worthless owing to errors of description, or from the thing itself not being patentable, the fees cannot be returned.

We understand that the Society of Arts is trying to get the English patent law amended so as to bring them on a level with the Americans in this respect, and if this is done we are justly safe in predicting that very soon it will be found

Manufacturers of the Boss Case.

that the number of patents issued in Britain fully as large if not larger than any other country in the world.

Many people think it is not worth while to patent any but the great inventions that apparently have unlimited possibilities before them. This is a great mistake, for as a matter of fact it is notorious that more money is derived from some of these apparently insignificant inventions than from the great ones, from which so much was naturally expected. From an exchange we learn that a curious investigator has recently been collecting some astonishing facts, showing the immense profits derived by persons who have taken out patents on toys and other modest trifles. People will be surprised to hear for instance that the common wooden toy-ball, with elastic string attachment, selling for a few cents in the stores, brings its patentee an income of about $50,000 each year. The man who first thought of perforating sheets of postage stamps so that they could be separated by tearing, instead of cutting as before, realized a fortune from his happy thought. The inventor of the gummed wrapper for newspapers is a wealthy man. The "dancing Jim Crow," the black toy with which all juveniles are familiar, yields $75,000 annually to its inventor, and the ordinary needle-threader brings $10,000 a year to its patentee. A piece of bent wire for suspending boots from the sides of packing cases was the lucky idea of a man who has since realized a fortune from it. The gimlet-pointed screw and the rubber tips to lead pencils yield independent fortunes to their inventors, while it is said of the son of the man who first patented copper toes for boots is as well provided for as if his father had left him $2,000,000 in United States bonds. The patentee of roller skates is $2,000,000 richer for his invention. Col. Green, who invented the "drive well," a simple arrangement for getting water by driving a two-inch tube into the ground until water is reached, and then adding a pump, has received royalty of $3,000,000 at least, while rubber stamps, different kinds of pens, and other small articles have been equally fruitful sources of wealth to their inventors. The greatest inventors, on the other hand, like the greatest authors, have been but poorly rewarded for their work. The best motto for those who wish to be successful inventors is Schiller's saying: "That is the truly secret which lies ever open before us; and the least seen is that which the eye constantly sees."

MONEY ORDERS.

Although our money order system is very much simpler than it formerly was, it has yet plenty of scope for improvement.

As at present made out an order is of no use until signed by the party for whom it is intended, and before it can be cashed or even deposited in a bank has to have an order endorsed on it by the Post Office department making it payable at any bank they specify. In Great Britain the money order system is a very simple one, is immediately understood, and is about as perfect as it is possible to make so important a matter. The person who desires to send a certain sum of money to another person in a different city or any other place where a money order office has been established, simply pays, at his own postoffice, the amount for which he obtains an order. This order has just the same value as a bank note for the amount which is written on its face. The cash is not transmitted from post-office to post-office—in this respect the systems in Great Britain and Canada are alike—but the order is made payable at any money order office to which it may be sent, and to any person to whom the buyer may subsequently choose to send it. In this country even the present simplified form of order requires a person of at least average intelligence and more than average experience to understand it, otherwise the clerk is obliged to tell every applicant for an order what he is obliged to write in each one of the dozen lines that have been ruled for his direction. By the English system this annoyance to the official and embarrassment to the applicant are avoided. The buyer simply pays twenty shillings for an order for one pound, and, renewing this certificate of payment, sends it to any one he may desire without giving the name of the intended recipient to the post-office officials. There is a slight risk that the order may fall into the wrong hands, but the possibility is far from being a probability. In any case there is always the opportunity of taking extra precautions whenever an order for a very large amount has been purchased with the object of sending it to persons at a distance.

But even this risk could be easily avoided by making the order payable to the person buying it or to his order in exactly the same way as an ordinary bank check or draft. The buyer could then make it payable to the order of any person he pleased and then sign his name, after which it would be useful only to the person to whom it was endorsed. If it went astray after that it would be useless to the finder unless he chose to run the risk of penetentiary by forging the name of the party to whom it was endorsed.

We do not see why the post-office authorities could not make this or some other equally simple and effective improvement upon our present system of money orders. If they would do so it would be a great boon to merchants at small places having no bank, and as to the wholesalers to whom they remit their money.

Selected Matter.

JOHN HARRISON, THE CHRONOMETER MAKER.

(Continued from last month.)

It may here be mentioned that it was comparatively easy to determine the latitude of a ship at sea every day when the sun was visible. The latitude—that is, the distance of any spot from the equator and the pole—might be found by a simple observation with the sextant. The altitude of the sun at noon is found, and by a short calculation the position of the ship may be ascertained.

The sextant, which is the instrument universally used at sea, was gradually evolved from similar instruments used from the earliest times. The object of these instruments has always been to find the angular distance between two bodies—that is to say, the angle of two straight lines which are drawn from those bodies to meet in the observer's eye. The simplest instrument of this kind may be well represented by a pair of compasses. If the hinge is held to the eye, one leg pointed to the distant horizon, and the other leg pointed to the sun, the two legs will be separated by a certain angle, which will be the angular distance of the sun from the horizon at the moment of observation.

Until the end of the seventeenth century the instrument used was of this simple kind. It was generally a large quadrant, with one or two bars moving

on a hinge—to all intents and purposes a huge pair of compasses. The direction of the sight was fixed by the use of a slit and a pointer, much as in the ordinary rifle. This instrument was vastly improved by the use of a telescope, which not only allowed fainter objects to be seen, but especially enabled the sight to be accurately directed to the object observed.

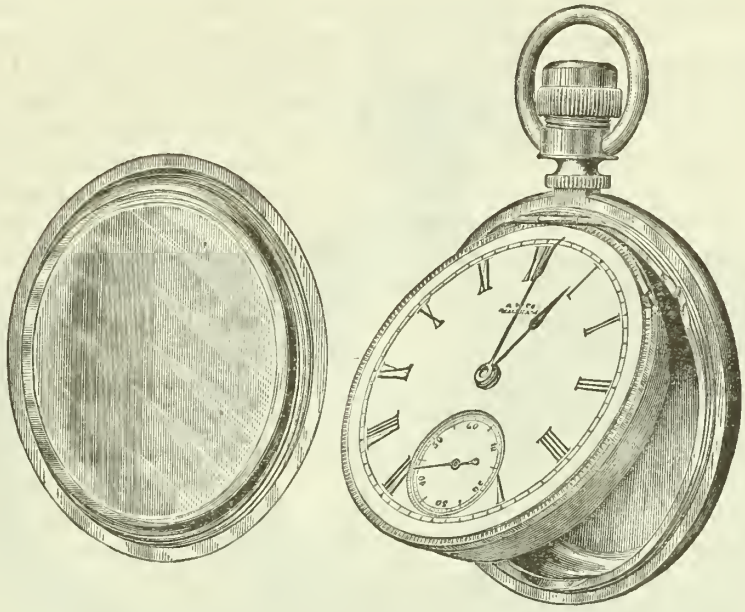
The instruments of the pre-telescopic age reached their glory in the hands of Tycho Brahe. He used magnificent instruments of the simple "pair of compasses" kind—circles, quadrants, and sextants. These were for the most part ponderous fixed instruments, and of little or no use for the purposes of navigation. But Tycho Brahe's sextant proved the forerunner of the modern instrument. The general structure is the same; but the vast improvement of the modern sextant is due, firstly, to the use of the reflecting mirror, and secondly, to the use of the telescope for accurate sighting. These improvements were due to many scientific men—to William Gascoigne, who first used the telescope, about 1640; to Robert Hooke, who, in 1660, proposed to apply it to the quadrant;* and to John Hadley, who introduced it. The modern sextant is merely a modification of Newton's or Hadley's quadrant, and its present construction seems to be perfect.

It therefore became possible accurately to determine the position of a ship at sea as regarded its latitude. But it was quite different as regarded the longitude—that is, the distance of any place from a given meridian, eastward or westward. In the case of longtitude there is no fixed spot to which reference can be made. The rotation of the earth makes the existence of such a spot impossible. The question of longitude is purely a question of TIME. The circuit of the globe, east and west, is simply represented by twenty-four hours. Each place has its own time. It is very easy to determine the local time at any spot by observations made at that spot. But, as time is always changing, the knowledge of the local time give no idea of the position of a moving object—say, of a ship at sea. But if, in any locality, we know the local time, and also the local time of some other locality, at that moment—say, of the Observatory at Greenwich—we can by comparing the two local times, determine the difference of local times, or, what is the same thing, the difference of longitude between the two places. It was necessary therefore to be in possession of a first-rate watch or chronometer to enable him to determine accurately the position of his ship at sea, as respected the longitude.

Before the middle of the eighteenth century good watches were comparatively unknown. The navigator mainly relied upon his Dead Reckoning, without any observation of the heavenly bodies. He depended upon the accuracy of the course which he had steered by the compass, and the measurement of the ship's velocity by an instrument called the log, as well as by combining and rectifying all the allowances for drift, lee-way, and so on, according to the trim of the ship; but all of these were liable to much uncertainty, especially when the sea was in a boisterous condition. There was another and independent course which might have been adopted—that is, by observation of the moon, which is constantly moving amongst the stars from west to east. But until the middle of the eighteenth century good lunar tables were as much unknown as good watches.

Hence a method of ascertaining the longitude with the same degree of accuracy which is attainable in respect of latitude, had for ages been the grand desideratum for men "who go down to the sea in ships." Mr. Macpherson, in his important work entitled "The Annals of Commerce," observes, "Since the year 1714, when Parliament offered a reward of £20,000 for the best method of ascertaining the longitude at sea, many schemes have been devised, but all to little or no purpose, as going generally upon wrong principles; till that Heaven-taught artist, Mr. John Harrison arose;" and by him, as Mr. Macpherson goes on to say, the difficulty was conquered, having devoted to it "the assiduous studies of a long life."

The preamble of the Act of Parliament in question runs as follows: "Whereas it is well known by all who are acquainted with the art of navigation that nothing is so much wanted and desired at sea as the discovery of longitude, for the safety and quickness of voyages, the preservation of ships and the lives of men," and so on. The Act proceeds to constitute certain persons commissioners for the discovery of the longtitude, with power to receive and experiment upon proposals for that purpose, and to grant sums of money not exceeding £2,000 to aid in such experiments. The clause of the Act, by which rewards are offered to such inventors or discoverers as shall succeed in enabling the longtitude to be ascertained within certain limits, is as follows:—



"And for a due and sufficient encouragement to any such person or persons as shall discover a proper method for finding the said longitude, be it enacted by the authority aforesaid that the first author or authors, discoverer or discoverers, of any such method, his or their executors, administrators, or assigns, shall be entitled to, and shall have such reward as is hereinafter mentioned; that is to say, to a reward or sum of £10,000 if it determines the said longitude to one degree of a great circle, or sixty geographical miles; to £15,000 if it determines the same to two-thirds of that distance; and to £20,000 if it determines the same to one-half of the same distance; and that one moiety or half part of such reward or sum shall be due and paid when the said commissioners, or the major part of them, do agree that any such method extends to the security of ships within eighty geographical miles of the shores which are the places of the greatest danger, and the other moiety or half part when a ship, by the appointment of the said commissions, or the major part of them, shall thereby actually sail over the ocean from Great Britain to any such port in the West Indies as these commissioners, or the major part of them, shall choose or nominate for the experiment, without losing their longitude beyond the limits before mentioned."

It will, in these days, be scarcely believed that little more than a hundred and fifty years ago a prize of not less than ten thousand pounds should have been offered for a method of determining the longitude within *sixty miles*, and that double the amount should have been offered for a method of determining it within *thirty miles!* The amount of these rewards is sufficient proof of the fearful necessity for improvement which then existed in the methods of navigation. And yet, from the date of the

* Sir Isaac Newton gave his design to Edmund Halley, then Astronomer Royal. Halley laid it on one side, and it was found among his papers after his death in 1742, and twenty-five years after the death of Newton

THE AMERICAN WATCH CO.'S

PATENT DUST-PROOF STEM-WINDER,

-AND-

WHAT AN IOWA JEWELER SAYS OF IT.

(Extract from a letter written by **C. S. RAYMOND**, Clinton, Iowa, April 29, 1881:)

"I wish you would send me a Spring for the Wm Ellery Watch. * * * *
"By the way, this Ellery is a watch I sold to a farmer, in your Screw Bezel Case, last Fall. The
"first of January he lost the watch in the woods and found it this week in about one foot of water.
"It had lain three months and over in snow and water, with but a slight injury to the watch—only
"a hair spring."

The above, as will be seen, was a very severe test, and demonstrates that, for a reasonable length of time, during which a watch might be under water, it would receive no injury whatever.

We wish to call attention to the fact, that although we do not guarantee such cases to be absolutely water-tight, many of them are, and nearly all can be made so, with a little care and attention to details, such as thoroughly cementing the glass, etc.

As a Perfectly DUST-PROOF Stem-Winding Watch Case, we challenge the world to produce its Equal.

ROBBINS & APPLETON.

NEW YORK. BOSTON. CHICAGO.

passing of the Act in 1714, until the year 1736, when Harrison finished his first timepiece, nothing had been done towards ascertaining the longitude more accurately, even within the wide limits specified by the Act of Parliament. Although several schemes had been projected, none of them had proved successful, and the offered reward still remained unclaimed.

To return to Harrison. After reaching his home at Barrow, after his visit to London in 1728, he began his experiments for the construction of a marine chronometer. The task was one of no small difficulty. It was necessary to provide against irregularities arising from the motion of a ship at sea, and to obviate the effect of alterations of temperature in the machine itself, as well as in the oil with which it was lubricated. A thousand obstacles presented themselves, but they were not enough to deter Harrison from grappling with the work he had set himself to perform.

(To be continued.)

BOHMER & BASSANGE.

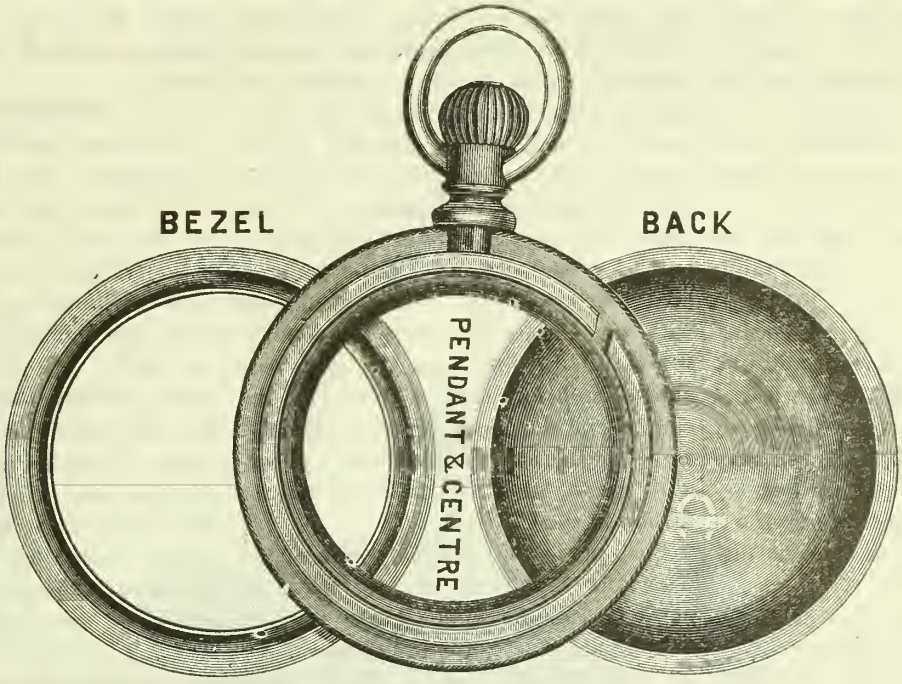
Messrs. Bohmer & Bassange belonged to the most important of the jewelers of Paris, under the reign of Louis XVI. The jeweler had already, as it were, separated from the goldsmith. True, also he worked in the precious metal, but in a more artistic manner; he sought his merit rather in the ingenious grouping of the jewels, than in the simple manufacture of the casket that was to contain them. It was his special province to have their artistic disposition constitute the principal value of the trinket, while the setting itself was to be more useful than ornamental. This was the reason why, in Paris, next in Holland, England and in the German cities, where the goldsmith had once enjoyed a world-wide renown, the jeweler gradually occupied his place, while he was reduced to a secondary rank, and the once independent master, little by little became a factory piece-hand—a simple human machine.

The jeweler Bohmer, as furnisher for the royal court of Versailles, and chief of the firm, had sold a necklace valued at 360,000 francs, to Queen Marie Antoinette, which sum was to be paid from the pocket money of the Queen, who had a yearly income of $100,000. Bohmer had, besides this, furnished her a trinket of rubies and diamonds, as well as a pair of bracelets for 800,000 francs. The Queen now told the court jeweler that she had sufficient ornaments of all kinds, and desired nothing further. Bohmer, however, more merchant than artist, more of a speculator with such precious ornaments than ambition for artistic fame, nevertheless was incessantly occupied in arranging the handsomest diamonds to be found in commerce into a necklace, for the speculative purpose of selling it to the Queen. He engaged the services of a courtier, who mentioned the matter to the King. Louis XVI., charmed with the beautiful diamonds, quickly made them a present to the Queen, but Maria Antoinette persuaded her husband to consider the immense value of the trinket, beyond a million and a half of francs, and not to purchase it, wherefore it was returned to the jewelers.

A year afterward, during which time Bohmer had vainly sought to sell it in every court in Europe, he caused it to be submitted again to Louis XVI., who again destined it for a present to his spouse. The Queen refused it a second time. Immediately after this refusal, Bohmer, in his quality as court jeweler, solicited an audience with the Queen. He knelt at her feet and declared that he was a ruined man, with no other recourse than that of drowning himself. The Queen responded that the necklace, which threatened his ruination, had not been ordered by her; on the contrary, before he purchased the diamonds, she had distinctly told him that she possessed sufficient ornaments.

"I did not want to buy the necklace from yourself, nor did I wish to receive it from the King," she said; "therefore, separate it, and seek to sell it in different parcels; but above all, do not drown yourself."

From that day forward, Marie Antoinette avoided a meeting with Bohmer, and went so far as to give her repairs to another jeweler. The business appeared settled, principally with the Queen, but not for Messrs. Bohmer & Bassange, who set entire Paris into a fever of excitement with their necklace. They left no stone unturned to bring it again before the Queen. They had heard that a lady, the Countess de la Motte-Valois, was honored with great confidence by the Queen, because being a lineal descendant of the old royal house of Valois. The two jewelers craved an audience with the countess, for the purpose of laying the necklace before her. She granted it, and the ornament was submitted to her December 29, 1784. Apparently angry at being drawn into the business, she nevertheless promised the jewelers to intercede in their favor with the Queen.



The countess invited them on January 20, 1785, to appear at her house, and when there, she told them secretly that the Queen now desired to possess the ornament, and a nobleman of the court was commissioned by Her Majesty to conclude the bargain on her behalf. Several days afterward, she herself visited them, inspected the ornament minutely, and assured them that the purchaser on the part of the Queen would soon come.

And, indeed, on the following day, His Eminence, the Cardinal, Prince of Rohan, one of the most important personages of the court, in spite of the enmity the Queen since her marriage cherished against him, came to the jewelers. He confirmed what Madame de la Motte had said, and submitted a contract to them, written by him, according to which the necklace was to be taxed, if the value of 1,600,000 francs should appear exhorbitant; the purchase sum should be paid in semi-annual installments; the acceptation of orders was stipulated, and the necklace was to be delivered on the 1st of February. The jewelers agreed to these conditions and signed them, without any name having been mentioned in the transaction; they next delivered the contract to Madame de la Motte, who returned it in two days to the Cardinal, with the express written acceptation of every clause, and signed by "Marie Antoinette, of France."

The jewelers now delivered the necklace with full confidence to the rich and mighty Cardinal, and thanked their stars that this speculation had, after all, come to a successful issue. Their ardor was rather dampened soon after, when the Cardinal came, and in the name of the Queen demanded a cutting down of 200,000 francs. The jewelers also agreed to this, in order not to open the negotiation again, and at the desire of the Cardinal, they even directed a letter of thanks to the Queen. They were not a little taken aback when informed that

the Queen, upon reading the letter, had exclaimed laughingly :

"What do these people wish to say ? I believe they have lost their reason."

July came, and the first payment of rates failed to make its appearance. They became desperate. Bohmer paid a visit to Madame de Campan, a court lady of Marie Antoinette, and communicated to her his woe, and the payment of the installment due to them from the Queen. Madame de Campan was astonished at the information, and assured him that she had neither heard nor seen anything of the necklace.

Bassange, on his part, had gone to the Cardinal, who sought to pacify him. The Queen, he said, had no money at the present time, as he had been importuned by the Countess de la Motte, and had only handed him 30,000 francs as interests, which he at once delivered.

"Is it perhaps possible that you may be deceived by your intermediary between the Queen and yourself ?" Bassange asked, who had become distrustful.

The Cardinal repelled this suspicion with indignity, to be completely undeceived a few days afterward, as well as the jeweler. Madame de Campan had recounted to the Queen what she had heard of the latest necklace story and of the demand of Mr. Bohmer, and the cleverly-arranged stupendous swindle was by this means exposed. On the 15th of August, the King caused Cardinal Rohan, in his sacred vestments, to be arrested before the entire Court, charged with the crime of having forged the name of the Queen, for the purpose of becoming possessed of the necklace.

The couse of affairs speedily developed that the Cardinal was the worst deceived of the party, and had simply been a tool in the hands of the Countess de la Motte, who had used him in order to obtain the necklace. She had only too well speculated upon the several weaknesses of the prelate, viz., first of all, his amorousness, his credulity, and his desire to become a favorite of the handsome Queen ; she, herself, was neither a confidant of the Queen, nor known at Court ; in fact, nothing else than an impoverished adventuress under her noble name ; all the letters displayed by her as coming from the Queen, the request of the latter for, and her final assent to, the purchase of the necklace as well as the ratification of the several contract clauses, and the final signature of the Queen, had all been forged by her. She had duped the Cardinal, by making him a party to a nightly comedy, in which the poor fool thought that in the darkness he was addressing the Queen of France, when it was only a companion of the Countess de la Motte, who resembled the Queen, and silently listened in the obscurity to his amorous pulings, and at parting presented him with a rose. And during this well-calculated and better executed infatuation of the Cardinal, the Countess had sold the diamonds in London ; one part for 27,000, another for 16,000, and a third for 36,000 francs ; the setting for about 50,000 francs ; the central part with the largest diamonds for 400,000 francs. With this sum she had purchased and furnished a house in the country in the most gorgeous manner, while in the city she inhabited a miserable garret, and here made her confession to the Cardinal.

She, of course, was likewise arrested upon the statements of the latter, as *particeps criminis ;* while Rohan was let off with a few acts of humility and many costs, the Countess de la Motte was sentenced to be branded and perpetual imprisonment. She managed to escape to England after a short time, from where she directed memoirs and pamphlets, full of libellous hatred against Marie Antoinette, contributing much to that the Revolution of 1789 was personally directed against her.

The jewelers, Messrs. Bohmer & Bassange, in this manner got rid of their precious necklace, of the value of one and a half millions of francs, perhaps the greatest price paid up to that date for an article of jewelry or composed by a jeweler. The Cardinal Rohan had pledged his honor to pay for the ornament, and to shoulder both the damage and the blame. The jewelers thus received their money, but it may be expected that they had to lower the price considerably.

This is the celebrated case of the "Diamond Necklace," which has served as theme for novels, songs, poems, etc., and innocent as it was, the jewelers obtained an undying celebrity thereby, and furnished sharp weapons to the enemies of Marie Antoinette. It has been an unfortunate work of the jeweler's art, and formed a link of the chain that shackled the feet of French royalty, by which it was dragged down from the throne, and up the steps of the scaffold, because this story became one of special scandal to the Queen. Thus will often the actions of man unintentionally be magnified into historical events, and from these insignifigant details, from these little causes that produce great effects, the future student of history will astonishingly comrehend what history is.

The most remarkable natural bridge is probably the Jisrel Hajar, which spans a gorge not far from the ruins of the Temple of Adonis, in the province of the Lebanon in Syria. It is a flat piece of limestone rock from ten to fifteen feet thick, perfectly arched on the underside. The gorge is about 150 feet across, and the bridge is about 100 feet from the bed of the torrent below. The bridge is so broad and level that a good carriage road might be made over it. This bridge is surpassed in height by the natural bridge in Rockbridge county, Va., about 125 miles west of Richmond and about two miles from the James River. It extends over Cedar Creek. The height of the arch is 200 feet, and the upper surface of the bridge is 240 feet above the stream.

BUSINESS CHANGES FOR APRIL.

Samuel L. Lauler, Hardware, Amherstburg, style of firm changed to Lauler & Orton. Neveux Bros., Hardware, Windsor, dissolved, George A. Neveux continues alone. James J. Radford, jeweler, Winnipeg, assigned in trust. G. H. Pedler, Hardware, Oshawa, assigned in trust. John Kidd, Hardware, Seaforth, dead. Gordon & Scott, Hardware, Wingham, sold out to J. A. Cline & Co. Noah L. Piper, Hardware, Toronto, damaged by fire and selling out. Fred. Leas, Hardware, Woodville, admitted D. McDonald, style now Leas & McDonald. L. swindle the creditors out of their money. Most of the Ontario creditors will, we understand, fight the matter to the end, and will do all the law will allow in making an example of the principals concerned in the matter.

We regret very much to learn that Mr. W. J. Douglas, Jeweler, of Pembroke, had his store burned last month. We trust he was amply covered by insurance, and will soon be ready to commence again.

Mr. W. K. McNaught, of the firm of Zimmerman, McNaught & Lowe, leaves for Europe via the Dominion Steamship "Sarnia," on the 3rd of May. He expects to be absent about three months.

James J. Radford, Jeweler, Winnipeg, has assigned in trust, *reason*—not content with minding his own legitimate business, he engaged in land speculations in which he came out second best, *moral*—Jewelers should stick to their own legitimate business and leave risky speculations to other people.

Enterprising Firm.—It is an admitted fact, that it is no ordinary achievement for a new firm, in any line of trade, to enter upon a successful business career. If courage, industry and capital are required in any line of the wholesale business, that line is the jewelry. It speaks well for a firm, and it betokens that its members possess the above qualities when they achive the success attained by the well-known jewelers, A. C. Anderson & Co., of Hamilton. They started business in 1877 in up-stair rooms; since then there their rapidly increasing business has forced them into removing three times, and in each case into larger premises; lately they have removed into No. 55 King St. East, which has been fitted up specially for them, and is one of the most convenient wholesale houses in Hamilton

COMMERCIAL JURISPRUDENCE.

Every person at all conversant with the proceedure of our law courts must at some time or other have been impressed by the farce of having complicated commercial cases tried by a jury of twelve enlightened (?) rural citizens, whose knowledge of mercantile affairs consists at most in their being able to reckon up the value of their wheat by the bushel or their eggs by the dozen. State to the average country juror almost any ordinary commercial problem, and he will be as completely at sea as a city merchant who had never before seen a farm would if asked to plough a field or run a threshing machine.

The merchant would, without experience, make but a poor farmer, and the farmer must likewise make but a poor show when called upon to adjudicate upon business affairs of which he has no practical knowledge whatever. The absurdity of such a system was probably never more clearly demonstrated than in the case of Joseph & Son *v.* Battegay, which arose out of the purchase from the plaintiff by the defendant of the bankrupt stock of Mrs. Aarons, of Toronto. It appears that Battegay purchased the stock and business at a price of 55 cents on the dollar, or a total of $4,900.00, and he afterwards purchased from the plaintiffs new goods to the amount of $1,600.00, making a total liability of $6,500.00. To these bankrupt and newly purchased goods he added the stock he had previously had in his store in Three Rivers, Que., and on the combined stocks, commenced his commercial career in Toronto. The business did not prove a financial success, and Battegay was unable to pay the notes due on account of the purchase money as fast as they matured and asked the plaintiffs what he should do under the circumstances. Acting upon their advice he commenced to auction off his stock, and remitted them $200.00, as the proceeds of these sales which do not appear to have been very successful. Finding things getting worse, he then shipped the entire balance of his stock to the plaintiffs at Montreal, to be sold on his account, and the proceeds devoted towards the liquidation of his indebtedness to them. These goods were sold *en bloc*, and realized only $1,300.00, which amount added to the $200.00 of cash remitted as the proceeds of the auction sales made a total of $1,500.00 received in all by the plaintiffs from Battagay on the original debt of $6,500.00, thus showing a net loss to them of $5,000.00 on the whole transaction.

Battegay subsequently went to Europe, and some time afterward returned to Canada, where he has since carried on a small jobbing business. Finding that he was not making any effort to pay up the balance due them, and that he repudiated the liability entirely on the ground that when he sent the balance of the stock back he had more than overpaid them, the plaintiffs commenced an action to establish their claim.

Any business man will at once from the statement above given that the defendant was without doubt indebted to the plaintiffs to the amount of $5,000.00, the amount of the unpaid balance. The only things that could overthrow this would be in case the plaintiffs had agreed to take back the balance of the goods as payment in full of their claims, or if they had been partners with the defendant and bound to share with him the loss or gain in the transaction.

That neither of these pleas were set up is ample proof that they had no existence, and as a matter of tact the only grounds that the defence had were that the whole affair was a put up job, or in English a swindle, or that the plaintiffs should have been amply paid by the goods returned. On both of these points the evidence seems to have been clearly in favor of the plaintiffs. Strange to say, the jury returned a verdict for the defendant, almost in opposition to the facts, and we are informed upon good authority that one of the jurors since stated that they based their verdict entirely upon sympathy with a poor man against a rich one, and in opposition to law and facts.

Although this in itself would be bad enough for the plaintiffs it could probably be righted at some expense by appealing the case to some higher and more competent tribunal, but there is another aspect of this case that we have more to do with than even the curious verdict we have have referred to, and it is this: In remarking upon the case and its results, one of our city papers went out of its way to abuse the plaintiffs and hold them up to public scorn as a company of sharpers, who knowingly took advantage of and abused the confidence of a customer.

We like to see newspapers abreast of the times as regards news, and we admire one that is not afraid to expose evil because its perpetrators are wealthy and influential, but for the literary rib-stabbers, who, under the guise of society scandalmongers, peep through keyholes and play the part of eavesdroppers, even though it be done under the guise of an innocent Peek-a-boo, we have nothing but profound contempt. The motto of such papers is "Anything whether true or false, so long as it is sensational and will make the paper sell."

In this case, however, we think they have overshot their mark by firing at game which cannot be harmed by any envenomed shafts they may be able to discharge. Either Mr. Louis Davis or Mr. Schwob (both of whom were represented by the plaintiffs) are well enough known to the jewelry trade of Canada to make them safe from such attacks as the one we refer to, and it only requires the mention of their names to prove the falsity of any such accusation. Both of those gentleman have been actively engaged in the jewelry business in Canada for half a score of years and their record has been such as to place them above even the breath of suspicion as regards anything dishonorable. Of course, to any one who knows these gentlemen such explanations are entirely unnecessary, and it is only because of the general public who do not know them may do two honorable and high-minded business men an unwitting injury that we enter into these explanations at all.

WORKSHOP NOTES.

To Remove Tin from the Stock.—Just previous to pouring the gold, throw a small piece of corrosive sublimate into the pot, stir well with a long piece of pointed charcoal, and allow the pot to remain on the fire for about half a minute afterward. This will take tin from the alloy; gold containing tin will not roll without cracking. To remove emery or steel filings from gold, add a small piece of glass-gall while melting; it will collect them in the flux.

To Clean Brass.—Rub the surface of the metal with rotten stone and sweet oil, then rub off with a piece of cotton flannel, and polish with soft leather. A solution of oxalic acid rubbed over tarnished brass soon removes the tarnish, rendering the metal bright. The acid must be washed off with water, and the brass rubbed with whiting and soft leather. A mixture of muriatic acid and alum dissolved in water imparts a golden color to brass articles steeped in it for a few seconds.

To Prepare Chalk.—Pulverize the chalk thoroughly and then mix it with clean rain-water, in proportions of two pounds to the gall. Stir well, and then let it stand about two minutes. In this time the gritty matter will have settled to the bottom. Slowly pour the water into another vessel, so as not to stir up the sediment. Let stand until entirely settled, and then pour off as before. The settlings in the second vessel will be prepared chalk, ready for

this Trade Mark is stamped on all Knives, Forks, Spoons and other flat ware of our manufacture.

The A 1 Goods are Standard Heavy Plate, and XII signifies that in addition the articles have an extra quantity of Silver on all the parts most exposed to wear.

The Meriden Britannia Company have been awarded the highest premiums wherever exhibited, from the WORLD'S FAIR, 1863, to the PRESENT TIME, and the high reputation of our Goods throughout the world has induced other makers to imitate our Trade Marks and name as well as our designs, and as many of our patrons have, through a similarity of names, purchased inferior goods under the impression that they were our manufacture, we are compelled to ask especial attention to our Trade Marks.

THE FACT THAT OUR NAME AND TRADE MARKS ARE BEING SO CLOSELY IMITATED SHOULD BE A SUFFICIENT GUARANTEE TO THE PUBLIC THAT OUR WARES ARE THE BEST IN THE WORLD.

WE RE-PLATE OLD WORK AND MAKE IT EQUAL TO NEW.

use as soon as dried. Spanish whiting treated in the same way, makes a very good cleaning or polishing powder. Some watchmakers add a little crocus, and we think it an improvement; it gives the powder a nice color, at least, and therefore adds to its importance in the eyes of the uninitiated.

Salt as a Lubricant.—It is said that if iron or steel wire is immersed in a solution of common salt, and allowed to remain till the temperature is the same as that of the solution, the crystals will adhere to the surface with such tenacity as to form an almost perfect lubrication for future drawings. The practice of using brine or salt and water on hot journals is an old-time one, the result being good when they are hot (not warm). The effect in both instances is probably identical.

Writing Inscription on Metals.—Take ¼ pound nitric and 1 oz. muriatic acid. Mix, shake well together, and it is ready for use. Cover the place you wish to mark with melted beeswax; when cold, write your inscription plainly in the wax clear to the metal, using a sharp instrument; then apply the mixed acid with a feather, carefully filling each letter. Let it remain from 1 to 10 minutes, according to appearance desired, then throw on water, which stops the process, and remove the wax.

To Transfer Prints, etc.—Take gum sandarac, 4 oz.; mastic, 1 oz.; Venetian turpentine, 1 oz.; alcohol, 15 oz. Digest in a bottle, frequently shaking, and it is ready for use. Directions: Use, if possible, good plate glass, of the size of the picture to be transferred, go over it with the above varnish, beginning at one side, press down the picture firmly and evenly as you proceed, so that no air can possibly lodge between; put aside, and let dry perfectly, then moisten the paper cautiously with water, and remove it piecemeal by rubbing carefully with the finger; if managed nicely a complete transfer of the picture to the glass will be effected.

SCIENCE NOTES.

Gas companies are now turning their attention in England to the manufacture of sulphate of ammonia, and the probability is that there will be more attention than ever given to this industry by manufacturers of illuminating gas. Progress in electric lighting is working a change in utilization of so-called waste products.

It has been proposed, says the *Glassware Reporter*, to employ zinc for extracting gold from auriferous rocks. The pulverized rock is gradually introduced into a bath molten zinc, which combines with the precious metal so that the refuse which rises to the top can be skimmed off. The gold may be subsequently separated by distilling the alloy, the zinc passing over and leaving the precious metal behind.

To make incombustible writing and printing paper, asbestos of the best quality is treated with potassium permanganate and then with sulphuric acid. About 95 per cent. of such asbestos is mixed with 5 per cent. of wood pulp in water containing borax and glue. A fireproof ink is made of platinous chloride and oil of lavender, mixed for writing with India ink and gum, and for printing with lampblack and varnish.

There is one thing to be said about the incandescent electric light, with all its drawbacks. It neither vitiates the air nor gives the high and often unbearable temperature of gas. No doubt one of these days electric illumination of dwellings will be a usual thing in large cities.

It is almost a self-evident fact that there should be some other way of disposing of sewage than turning it into streams. But there is hardly any censure too severe for those who cut and store ice from polluted waters. Organic germs of disease are contained in such ice. People drink water cooled by it in the summer, when the system is most liable to sickness, that may last all the year round.

M. Cornu thinks that he has ascertained by experiment that the glowing of phosphorus is due to a volatilization of its mass and a subsequent production of ozone by electrical energy generated by the volatilization of the phosphorus. Phosphorus does not glow at all in oxygen under high pressure, because, says M. Cornu, volatilization is impeded, and at a certain limit becomes too slow to ozonize the oxygen. Gases which prevent the formation of oxygen also prevent phosphorescence.

Filters of a cheap and efficient nature ought to be in the market. A draught of good pure water in the morning can rarely be had. Cisterns are placed so that they receive and absorb the gases of water-closets and the dust which arises from rooms during the weekly sweeping out. Fifty cents ought to be enough for a filter to supply any single person with drinkable, wholesome water. Another good thing about a filter is that the ice need never come in contact with the water, and yet make it cool enough to be palatable.

The ancients knew a great deal for which they got very little credit. A short time ago a collection of surgical instruments was dug up at Pompeii. It was evidently the property of some single establishment, and was quite elaborate. Of course the "find" was removed to the Naples Museum. One of the appliances attracted great attention. It was a long rod with a metallic plate fixed at one end at an angle of 135 degrees. At first it was thought to be a cautery for internal operations, but its resemblance to the modern laryngeal mirror suggests the probability that it was so used.

The Watchmaker, Jeweller and Silversmith,

A Monthly Illustrated Journal. Published in London.

The Representative Organ of the Watch, Jewellery and Kindred Trades in the United Kingdom.

It is full of original information and thorough practical instruction contributed by the leading writers on the various subjects connected with the above trades. The text is well illustrated by wood-cuts, and two supplements of artistic designs for jewellery, etc. accompany each number.

This important Trade Organ, now in its seventh year of publication is in the hands of every British Watchmaker, Jeweller and Silversmith, and is therefore a most valuable medium for manufacturers requiring publicity in Great Britain.

Our list of permanent contributors includes such names as: J. U. Poole, Richard Whitaker, Henry Ganney, Moritz Grassmann, Herrmann, E. J. Watherston, W. H. Singe an ample guarantee for the sterling value of the journal. Subscription 5s. per annum.

Editorial.

WHY MERCHANTS FAIL.

It is said on good authority, that more than seventy-five per cent. of all the people who start in business fail during some period of their career. If this be a fact, and from the many eminent names which back up the assertion we cannot reasonably doubt it, it surely reveals "something very rotten in the state of Denmark." We believe that this statement is true, and we think that perhaps a short discussion of a few of the principal reasons of such failure may not be out of place at this juncture.

Of course nearly every case of failure is caused by a different combination of circumstances, and still there are some general principles underlying trade, the non-observance of which will furnish a key to many otherwise inexplicable disasters. Amongst the principal of these may be mentioned the following :

1. *Lack of business training.* Probably more people fail from this cause than any other. It is a common thing in this country of ours, where people do not stick to the same business from generation to generation as they do in the old world, to find persons who have made some little money by farming or some kindred occupation take up the idea that they are fully competent to run a store, and that such a life, while being more genteel than the one they have hitherto led, is also more remunerative. Acting upon this idea they sell their farms and invest the proceeds in stock, and as long as the money lasts they are apparently prosperous. But a time comes sooner or later to the most of these dealers, when this source of supply becomes exhausted, and then they begin to realize that business is not such child's play as they used to think it, and in nine cases out of ten the end of the struggle is failure. Others again are tempted to put their money into some established business on the strength of some plausible story of the business paying well, but wanting more capital, and the novice, knowing little of the general principles of business and less of book-keeping, is oftentimes drawn into the trap and taught to pay for his experience at the loss of his money. Apropos of this kind of thing there is a good story told of a certain Israelite who had just roped into his business a partner having more money than brains. Being asked by some one on what principles the business was established, and how it came about that the other partner furnished the money while he furnished the funds, he replied, "Vell you see at present he has the monies and I have the experience, but after awhile I vill have the monies and he vill have the experience." This story may not be strictly true, but it has at least been the truthful experience of many a person who put his good money into a business, as against his partner's experience.

We scarcely understand how any sensible man should expect to succeed in any business that he is not thoroughly conversant with. Of course there are exceptions to this rule, but they succeed either on account of advantageous surroundings or natural business talent, and their success is no proof that every Tom, Dick or Harry can go and succeed likewise. It would appear about as sensible to us for a farmer who never touched a piano in his life to expect at once to make a living by teaching pupils to play on an instrument about which he knew really nothing. The fact is that business is a science, its rudiments and principles have to be mastered in the same manner as mechanics, music or any other business or profession that is usually supposed to demand previous training. They understand these things better in the old world than we do in this, and young men have there to serve a five years' apprenticeship to any business before they are supposed to understand it. With us, a lad after putting in six months in a shop usually thinks he can run the machine as well as his boss, and the result is that our failures from this cause as compared with those in the old world are just about in an inverse ratio to the time spent in training.

2. *Extravagant habits* are very often the cause of failure, even to those whose capital and business habits should entitle them to a high measure of success. To use a common expression, successful merchants often "feel their oats" so much that they are carried away by their success, and forgetting that economy was a great factor in helping them into their present position, they allow themselves to be led into all sorts of useless expenditure. Better dress and more of it, increased household expenses, free handed charity ; these and many other things of a like nature combine to impoverish many a merchant who, had he persevered in the methods with which he entered business, might have kept on steadily making money. Every merchant should find out at least once a year how his business is prospering, and his general expenses should always be based upon his profits and always be within his means. He should, in other words, put himself on a salary, and his salary should never be exceeded except for some very grave and weighty reason. In regard to charitable subscriptions, while he should do all in this way his means will allow, he should remember that "persons should always be just before they are generous," and that if he exercises this habit too freely, he may be making a gift of his creditors' money instead of his own. We have known merchants, (who were afterwards proved at the very time to have been hopelessly insolvent) donate thousands of dollars for the purpose of church building, when as a matter of fact they were worth less than nothing, and the money thus misappropriated was really not their own but that of their creditors. This kind of thing may be orthodox and pass current in some of our churches, but it don't come up to the standard of respectable business morality by a jug full. In referring to an incident of this very kind that occurred in one of our large cities, a Canadian poet sarcastically observes :

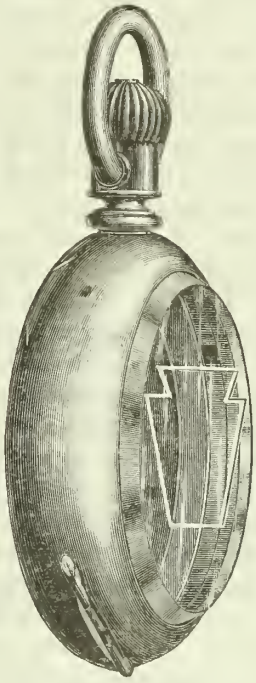
"Plank down, plank down your shekels ;
Don't say you can't afford ;
You'd better let your creditors wait,
Than try to cheat the Lord."

3. *Speculating in real estate, and building fine dwelling houses* is another and very

fruitful source of failure, and many a man with a good business training and economical habits has shipwrecked his vessel on this commercial rock. As a rule a merchant has no business whatever to encumber himself with real estate. He may with advantage own his dwelling house, but even here he loses money if the interest on his investment comes to more than the rent of similar quarters. However good speculations in real estate may be for the man out of business who has capital to invest, to the man in business they are usually a loss in more ways than one. Instead of locking up his money in real estate a business man should endeavor to keep it in his business. Ready cash is always handy to a good business man, and by its help he is often enabled to take advantage of bargains that he could not possibly touch unless he had on hand and to spare. If a man's business pays him at all, he can generally find plenty of room in it to invest all the money he can command, and as a rule such investments will pay him a better per centage than real estate speculations, however promising they may look at the outset.

If a merchant has more money than he can possibly use in his business, he may invest it any way he pleases; but few of our merchants are in that position, we are sorry to say.

We think we can recall a score or more of merchants, among the very highest in the land, who ruined themselves by attempting to build dwelling houses far beyond their means. In several instances these palatial residences still bear testimony to their original owners by the device sculptured over their portals, while those who wrecked themselves in their construction are penniless wanderers. The "old book" was not far astray when it advised a man before he started to erect a building, to carefully count the cost, least not having money enough to finish it, he should lose all he had and another should come in and enjoy his labors.



4. *Over-buying, and not buying carefully enough*, are also good assistants in this work of ruining merchants. The best buyer is also the most careful buyer, and though he may at times buy large lines of staple goods when he gets a first-class bargain, he generally buys just to suit the necessities of his business. As a rule the reckless buyer will come to grief in the long run, for reckless buying necessitates reckless selling and reckless credits. The reckless buyer often does a large and apparently flourishing business, but as has been proved a hundred times by the assignee, he has done it without profit. Having large notes maturing he was forced to make large sales, and no matter whether the goods were in demand or not, they had to be sacrificed in order to keep the ball rolling. As a rule a merchant should always buy his goods for cash, and take advantage of all the discounts that can possibly be obtained. If he buys in this way and buys carefully he need never fear; no creditor can trouble him, and he is bound to succeed. Few merchants know the saving that may be effected by these cash discounts; in even a small business they will amount to hundreds of dollars, and often pay shop rent, fuel and such like expenses. The merchant who pays cash is always the best served, and he can't possibly fail because he doesn't owe anybody. The nearer any merchant can come to paying cash for all he purchases, the nearer he will come to assured success.

5. *Too much, and indiscriminate credit*, is a very common trouble amongst country merchants, and investigation has proved it to be a fruitful source of failure. We have often said that credit is too cheap in this country both by wholesale and retail dealers; the sooner this evil is remedied the better and the healthier trade will become. We know lots of retail merchants who with thousands of dollars' worth of accounts on their books have not been able to raise cash enough to pay a hundred dollar note. Now, why should such a state of things exist, except for the reason we stated above that competition and cheap credit make the merchant's business scarcely worth doing. Our idea is that every retail merchant should do an exclusively cash business, he should buy for cash and sell for cash, and if he credits at all it should be as seldom as possible, and only as a special favor to responsible customers. There are occasions in every business when circumstances almost compel a merchant to give credit rather than lose a good sale, but we are satisfied that these are much fewer than most merchants would care to admit. No matter how good a person's standing or wealth may be, as far as the merchant's business is concerned, he is not half as good as the poor man who pays cash; provided he wants credit always. Cash is the merchant's best customer—he gives him no trouble in collecting accounts, he never causes him any bad debts, and he is always on hand when notes or payments of any kind have to be met. Credit on the contrary is long-winded, he puzzles the merchant's brain and spoils his eye-sight in looking over his bookkeeping, he is never on hand when wanted, his collection costs money, and in any shape you may dress him he takes up much valuable time that might be better employed. He costs both buyer and seller more than the regular market price, and often ends by ruining them both. Therefore we say to all of our readers, cultivate cash and discourage credit—it will pay you.

6. *Neglect of business for public affairs* has ruined many a promising merchant's career. As a rule this kind of thing attacks only the smartest and most successful of our merchants, and although in some cases the result may not be fatal, it is always detrimental to a business. We do not wish to be understood as saying that merchants should never have anything to do with public affairs; on the contrary we think they should always take a hand in them, provided they do not do so at the expense of their own business. What we decry is not conscientious efforts for the public good, but the mania that a great many merchants have to devoting most of their time to public affairs from which they cannot honestly reap any pecuniary advantage. "Charity begins at home" is an old motto and a true one, and if such merchants would only consider that they owe a duty to themselves, their families and their creditors, as well as to the general public, they would probably devote more of their time and talents to minding their own affairs and making an honest living.

7. *Drinking habits*, we have reserved to the last, not because it is the least important however, or the least productive of evil. By this pernicious habit merchants have not only been ruined in business, but ruined in body and soul as well. Everywhere we meet with these wrecks of humanity, persons that have thrown away good chances in business, thrown away friends, thrown away public respect, and finally after throwing away self-respect, are deliberately throwing away their lives. People may differ on the question of temperance and total abstinence as on

THE PERFECT BASCINE

DUST PROOF

THE

KEYSTONE.

For Sale by all Jobbers.

any other great social question, but so far as the successful business man is concerned the total abstainer has a great many advantages over his competitor who indulges too freely in drinking habits. Total abstinence never made a merchant incompetent to conduct his business, but the same cannot be said of drinking habits.

There are many other things that we might refer to in this connection did time and space permit, but we have already taken up more space than we intended when we first commenced this article. We cannot however conclude without saying that the rocks we have tried to point out as being dangerous to merchants are no imaginary ones, that they are a reality is proved every day by the account of failures which might possibly have been avoided had the bankrupts kept the correct course on the ocean of commercial life, and avoided the hidden rocks which centuries of experience have shown to underlie it.

WHAT ARE GOOD TIMES?

By the query which forms the caption of this article, we do not refer in any way to the good old times of "Queen Bess," or anything in that line, but simply ask the question in the abstract relative to the commercial good and bad times of the present age.

"Good" and "bad" are the antithesis of each other, and there should therefore be little or no danger of mixing them up in any connection, but we are afraid that as applied to commercial affairs, these phrases are sadly misused, and that in reality our "good" times are "bad" times, and our "bad" times "good" times, if we did but know it. How this is, let us briefly explain.

Times that we call "good times" are generally an era of inflation, everything goes up in value, produce of all kinds, stocks, real estate ; in fact almost everything advances in value ; business increases, profits are good, people make money, and spend it just as freely. Everything goes on smoothly to all appearances, and a good deal on the principle that the river's current is generally strongest and most tranquil just before it plunges over the dangerous waterfall, which shivers it to pieces. Are such times as these in reality good times? We think not, unless people are wise enough to profit by them. As a rule during such periods of commercial inflation both nations and individuals live above their means. Credit is cheap, and goods are plentiful, and thus many are induced to buy on time luxuries that they would never dream of had the ready cash to accompany the purchase. It is really because of this extravagance that many people fancy that times are good. But all this has to have an end. Importers cannot always go on increasing their importations *ad infinitum* ; neither can retail dealers always expect to sell the increased stock that a former season's success has induced them to buy. An end must come to all this, and that limit is reached when the nation or individuals have to pay up. When the day of reckoning comes it is found that the so-called good times have in reality been very extravagant times, during which nearly everybody had been living beyond their means. In other words during the so-called good times both nations and individuals bankrupt themselves commercially, and then have to go into liquidation, or bad times, in order to straighten themselves up again.

Now let us see what these "bad times" are, that are held up as such a bug-a-boo to the uninitiated in commercial politics. When bad or hard times come on, and nations or individuals who have for years been living beyond their means are *compelled* to pay up, they are forced, however, unwillingly to retrench their expenditure and bring it within their means. As a consequence purchases are not so frequent, more economy is practiced in buying, the volume of business decreases between heavy stocks and strong competition, and poor hard-up buyers' profits are reduced to a minimum, stocks and properties of all kinds shrink in value ; in fact everything shrinks, because it has to come down to a cash basis, which is really its true commercial value.

The consequence is that in a few years of this enforced economy, both nations and individuals begin to recover their position—by saving money they have made money, and as they again begin to find themselves in easy circumstances their rigid supervision and economy decreases until they gradually drift into their former habits of extravagance. Then we have another decade of "good times" when, forgetting the lessons of past years, they again launch out into the old habits of overbuying, and which after a time, longer or shorter, according to the rate at which they live, is succeeded by another period of depression or "bad times."

We think that most of our readers will agree with us that our bad times are not the worst times for us, although they may not be the most pleasant. No one cares particularly to diet themselves and go into a thorough course of training, although in the abstract they are willing to admit that it may be a good thing for the constitution, but when forced to do such a thing by the physician's orders, and it is "do or die," most of us prefer doing. and health to neglect and death.

As a matter of fact, "hard times" are not the matters of necessity that some writers would have us believe, but are simply an outgrowth, as they are the result of our own extravagance. If people always paid cash as they went there would never be any "hard times" in the sense in which the expression is used at the present time. How could a people be hard up when they didn't owe anything ; it is only those who owe and cannot pay that have to fear these periodical hard times.

The lesson for every merchant to learn from our remarks is to live well within your means, save something every year, be it ever so little ; keep your business well in hand, and buy as nearly on a cash basis as you possibly can, and sell as nearly as you can for cash only, and you will find that when the so-called "hard times" come around again you will be able to view their approach with a feeling of security that you never knew before under similar circumstances. The wise man profits by experience, whether his own or that of others, and we trust that for their own sakes all of our readers will put into practice the suggestions we have thrown out.

Selected Matter.

JOHN HARRISON, THE CHRONOMETER MAKER.

(Continued from last month.)

Everyone knows the beautiful machinery of a timepiece, and the perfect tools required to produce such a machine. Some of these Harrison procured in London, but the greater number he produced for himself. Many entirely new adaptations were required for his chronometer. Wood could no longer be employed, and he had therefore to teach

himself to work accurately and minutely in brass and other metals. Having been unable to obtain any assistance from the Board of Longitude, he was under the necessity, while carrying forward his experiments, of maintaining himself by working at his trade of a carpenter and joiner. This will account for the very long period that elapsed before he could bring his chronometer to such a state that it might be tried with any approach to certainty in its operations.

Harrison, besides his intentness and earnestness in respect of the great work of his life, was a cheerful and hopeful man. He had a fine taste for music, and organized and led the choir of the village church, which attained a high degree of perfection. He invented a curious monochord, which was not less accurately than his clocks in the mensuration of time. His ear was distressed by the ringing of bells out of tune, and he set himself to remedy them. At the parish church of Hull, for instance, the bells were harsh and disagreeable, and by the authority of the vicar and church wardens he was allowed to put them into a state of exact tune, so that they proved entirely melodious.

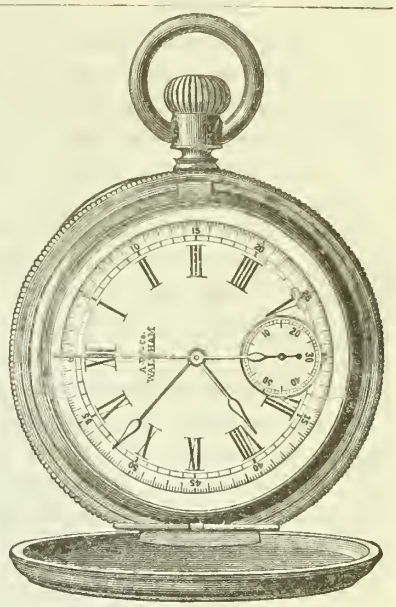
But the great work of his life was his marine chronometer. He found it necessary, in the first place, to alter the first mover of his clock to a spring wound up, so that the regularity of the motion might be derived from the vibrations of balances, instead of those of a pendulum in a standing clock. Mr. Folkes, President of the Royal Society, when presenting the gold medal to Mr. Harrison in 1749, thus describes the arrangement of his new machine. The details were obtained from Harrison himself, who was present. He made use of two balances situated in the same plane, but vibrating in contrary directions, so that the one of these being either way assisted by the tossing of the ship, the other might constantly be just so much impeded by it at the same time. As the equality of the times of the vibrations of the balance of a pocket watch is in a great measure, owing to the spiral spring that lies under it, so the same was here performed by the like elasticity of four cylindrical springs or worms, applied near the upper and lower extremities of the two balances above described.

Then came in the question of compensation. Harrison's experience with the compensation pendulum of his clock now proved of service to him. He proceeded to introduce a similar expedient into his proposed chronometer. As is well known by those who are acquainted with the nature of springs moved by balances, the stronger those springs are the quicker the vibrations of the balances are performed, and *vice versa*; so it follows that those springs, when braced by cold, or when relaxed by heat, must of necessity cause the timekeeper to go either faster or slower, unless some method could be found to remedy the inconvenience.

The method adopted by Harrison was his compensation balance, doubtless the backbone of his invention. His "thermometer kirb," he himself says, "is composed of two thin plates of brass and steel, riveted together in several places, which, by the greater expansion of brass than steel by heat and contraction by cold, becomes convex on the brass side in hot weather and convex on the steel side in cold weather; whence, one end being fixed, the other end obtains a motion corresponding with the changes of heat and cold, and the two pins at the end, between which the balance spring passes, and which it alternately touches as the spring bends and unbends itself, will shorten or lengthen the spring, as the change of heat or cold would otherwise require to be done by hand in the manner used for regulating a common watch." Although the method has since been improved upon by Beroy, Arnold, and Earnshaw, it was the beginning of all that has since been done in the perfection of marine chronometers. Indeed, it is amazing to think of the number of clever, skilful and industrious men who have been engaged for many hundred years in the production of that exquisite fabric—so useful to everybody, whether scientific or otherwise, on the land or on sea—the modern watch.

It is unnecessary here to mention in detail the particulars of Harrison's invention. These were published by himself in his "Principles of Mr. Harrison's Timekeeper." It may, however, be mentioned that he invented a method by which the chronometer might be kept going without losing a second of time. This was during the process of winding up, which was done once in a day. While the mainspring was being wound up a secondary one preserved the motion of the wheels and kept the machine going.

After seven years' labor, during which Harrison encountered and overcame numerous difficulties, he at last completed his first marine chronometer. He placed it in a sort of movable frame, somewhat resembling what the sailors call a "compass Jumble," but much more artificially and curiously made and arranged. In this state the chronometer was tried from time to time on a large barge on the river Humber, in rough as well as in smooth weather, and it was found to go perfectly, without losing a moment of time.



Such was the condition of Harrison's chronometer when he arrived in London with it in 1735, in order to apply to the commissioners appointed for providing a public reward for the discovery of the longitude at sea. He first showed it to several members of the Royal Society, who cordially approved of it. Five of the most prominent members—Dr. Halley, Dr. Smith, Bradley, Mr. John Machin, and Mr. George Graham—furnished Harrison with a certificate, stating that the principles of his machine for measuring time promised a very great and sufficient degree of exactness. In consequence of this certificate, the machine, at the request of the inventor and at the recommendation of Sir Charles Wagner, First Lord of the Admiralty, was placed on board a man-of-war, and carried, with Mr. Harrison, to Lisbon and back again. The chronometer was not affected by the roughest weather, or by the working of the ship through the vast rolling waves of the Bay of Biscay. By means of its exact measurement of time an error of almost a degree and a half (or ninety miles) in the computations of the reckoning of the ship was corrected at the mouth of the Channel.

Upon this first successful trial of his chronometer the Commissioners of Longitude gave Harrison the sum of 500*l*., on condition that he should proceed to make further improvements in his machine. Mr. George Graham urged that the Commissioners should award him double the amount, but this was refused. At the recommendation of Lord Monson, however, Harrison accepted the sum as a help towards the heavy expenses and labor which he had incurred, and was about to incur, in perfecting the machine. He was instructed to make his new chronometer of less dimensions than the first, which was thought too cumbersome

THE NEW WALTHAM WATCH.

CHRONOGRAPH,

The Best Watch now in the Market for General Use.

SOLD IN GOLD CASES ONLY.

Fourteen and Eighteen Carat Fine. Quality Stamped and GUARANTEED by the Company.

This watch is of medium size, and made to indicate and register the fifth second.

By new inventions and the application of American Machinery, THE AMERICAN WATCH Co. has so simplified the manufacture of these Watches as to greatly reduce their cost, and they can now be obtained at prices which make them the MOST DESIRABLE time-piece for all classes of watch wearers.

FOR SALE BY ALL FIRST-CLASS JEWELLERS

AMERICAN WATCH CO.,

ROBBINS & APPLETON, General Agents,

NEW YORK.

and to occupy too much space on board.

He accordingly proceeded to made his second chronometer. It occupied a space of about only half the size of the first. He introduced several improvements. He lessened the number of the wheels, and thereby diminished friction. But the general arrangement remained the same. The second machine was finished in 1739. It was much more simple in its arrangement, and much less cumbrous in its dimensions. It answered even better than the first, and though it was not tried at sea its motions were sufficiently exact for finding the longitude between the nearest limits proposed by parliament.

(To be continued.)

METHOD FOR CLEANING PEARLS.

[Mr. Paul Hiehle, in *Journal der Goldschmiedekunst.*]

In order to answer many inquiries desiring us to specify a method by which pearls that have become yellow by age or dirt can be purified and restored to whiteness, we have no hesitation in publishing the following, which, although not by any means new, appears to be unknown by many of our worthy colleagues:

The genuine pearl is a voidance product of several univalves and bivalves of both the ocean and inland waters. Its value depends upon its properties, among which size, shape, color, and luster (the so-called "water") are of chief importance. The pearls most valued are those which possess a pure silver-white luster, of very little irridescence, which is a rare sort. By far the greatest number has a tinge into yellow, and varies through almost all color shades into brown, green and black.

Such natural defective colors cannot be corrected in any manner. Still, even the purest white pearls may become yellow or change their once handsome color by continued wearing in the hair, around the neck, or on the arms, by absorbing perspiration and filth. This defect, produced by natural causes, may be corrected in the following manner.

Boil the pearls for about one-quarter of an hour in fresh cow's milk, in which soap has been dissolved; then take them out, rinse them in clean water, and dry with a clean white cloth. Inspect whether desired results have been obtained; if not, repeat the result several times. Should they still not become better, try the following:

Ask the baker in your neighborhood at what time he is engaged in baking bread, and go to him at this hour; let him form a small loaf of bread, within which the pearls are laid, either strung upon a silk thread or loosely wrapped in a piece of gauze, then let him bake the bread pretty strong, not too brown, however. When withdrawn from the oven, let it cool, break it and take out the pearls, which will generally be found to satisfaction and handsomely white. But it might occur that also this remedy is insufficient, and the pearls are still yellow; this is a sure sign that the dirt has become old and deeply penetrated into them, or that they appear green and blue, owing to have been strung on silvered copper wire. Forcible agents now become necessary.

Take a teacup full of well heated wine-vinegar, and suspend the pearls, hung upon a silk thread, or wrapped in a piece of gauze, in it for a few minutes. Also sulphuric acid, diluted with its equal quantity of water, may be used. Then remove and rinse them well in clean water, and repeat the operation until they have become white, and that the green spots have disappeared. This remedy will never fail except the pearls were naturally yellow or colored, against which defect, as already said, there is no help.

The causes of these operations are about as follows: The boiling of the pearls in milk and soap simply dissolves the exterior coating of dirt, the baking in bread absorbs it by the steam. These two remedies are perfectly innocuous and may be employed any number of times without ever hurting them. If, however, the last forcible means has to be used, caution is necessary, because the acid of the vinegar, still more the sulphuric acid, attacks them and dissolves the exterior coating, and would dissolve them altogether if not removed in time. Since, however, the dissolving occurs but very slowly, there is no danger of ruining them, if any degree of care is exercised, since they are composed of thin lamina, and it is plain that by exposing them to the vinegar, only the outer pellicle will be dissolved without in the least injuring the water of the others, and with it also the dirt is removed, and the blue and green copper solution which colored them exteriorly, by which they are restored to their original purity.

At this place I would like to append an observation to those jewelers who are principally engaged with stringing and setting pearls. I stated that the blue and green color originates from the silvered copper wire on which they have been strung. These wires being of copper, and the silver soon rubbing off, perspiration or other humidity will dissolve a little of this metal. This solution is verdigris which penetrates into the pearls, and imparts to them that disagreeable color to be seen in many, especially older articles, and which reduces their value most materially. Pearls should always be strung on fine silver wire, whereby they experience no alteration whatever. The trifling additional cost of the silver will not materially increase the value.

THE AUTOMATONS OF JACQUET-DROZ.

A manufacturer of the Canton of Neufchatel, by the name of Jacquet-Droz, was famous for his astonishing productions of automatic figures. One day he presented the King of Spain with a clock containing a shepherd, a dog, and a basket filled with apples. At the stroke of the hour the shepherd played his flute, while the dog playfully gambolled around him. The King was astonished at the mechanism.

"This is not all," the skillful artist said, "Your Majesty will please take one of the apples."

The King extended his hand toward the basket, but the dog commenced barking so fiercely that all the dogs of the palace joined in.

"This is not all," Jacquet-Droz again observed. "Will your Majesty have the kindness to ask him what time it is?"

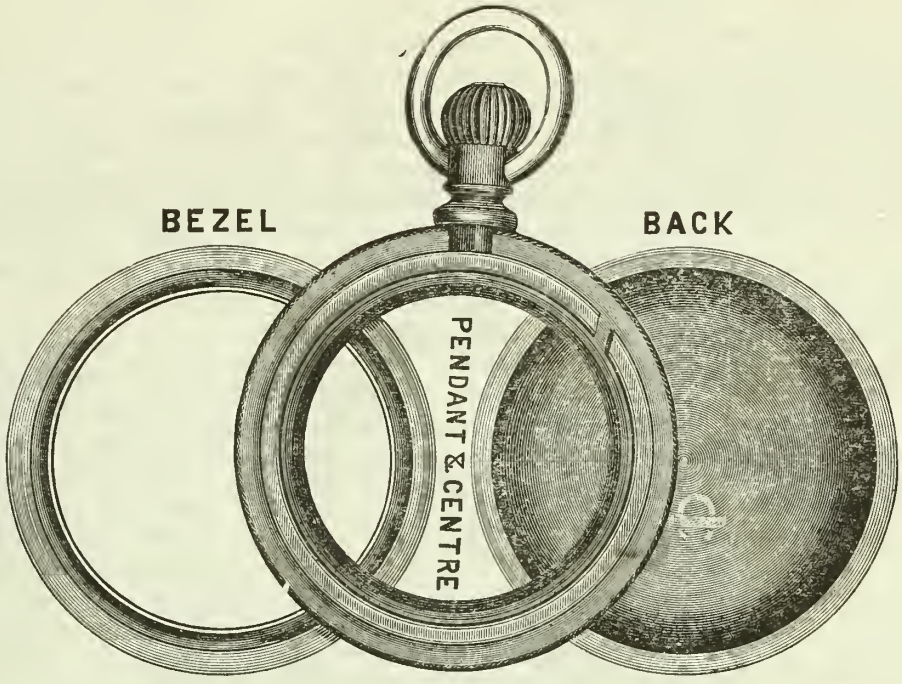
"*Que hora et?*" (What time is it?) the King asked.

"Ah, Sire," answered the horologist, "this good beast is born Switzerland, and does not understand Spanish. I was able only to teach him French."

"*Quelle heur est il?*" (What time is it?) the King asked.

"Fifteen minutes to three," distinctly responded the dog.

"This must be the veritable devil," tremblingly exclaimed a Spanish gentleman who was present at the audience, and tradition adds that Jacquet-Droz was accused of sorcery.



The "Excelsior" Patent Dust Proof Case.

PATENTED,

United States,

27th December,

1881.

PATENTED,

Dom. of Canada

28th February,

1882.

This is the first and only case made without one grain of solder. Every piece is cut from the solid metal and pressed into the shape used in the case. This process hardens the gold and silver by the only method known (that is to work it), and is handed to the Trade as hard as is possible to make it, being a great advantage over a case made in the ordinary way, in saving gold and silver by making a case as strong as a much heavier one that has been softened as heat does in soldering on pendant, joints, thumb catches, or joint to swing movement in. Heat not only softens the gold or silver, but warps it out of the shape that the snaps have been fitted to, and it is never perfect after soldering. The Excelsior Patent Dust Proof is never soldered, never heated, is fitted perfectly, and remains perfect. The Excelsior Dust Proof has no joints to wear out or break off. The Excelsior Patent Dust Proof has no spring to break or wear the case. There is no part of the Excelsior Patent Dust Proof that will wear. The Excelsior Patent Dust Proof is the safest case made for protecting the movement—it will never open in the pocket Put an Excelsior Dust Proof in your pocket, bend forward, backward, put yourself in any position you please and the Excelsior is closed tight. In an ordinary case, with springs, by bending forward the case will often open and when the lock-spring is worn, the case is nearly always open.

The Excelsior Patent Dust Proof Case is the strongest, best fitting and most durable case made. Ask your Jobber for the Excelsior Patent Dust Proof. Every case warranted as stamped, 18 kt., 14 kt., 12 kt., 10 kt., United States Mint Assay or Coin Silver, as may be stamped, and every genuine case bears the Trade Mark. The Excelsior Patent Dust Proof Case may be obtained from any of the jobbing houses in the country.

TRADE MARK.

Instructions to Open the Excelsior Patent Dust Proof Case.

First press the crown as in opening an ordinary Hunting Cased Watch, then to open front, turn bow to the right with thumb and finger; to open the back, turn left. To close, turn case back in same position as when case was closed, and snap same as glass bezel on any watch.

BIGGEST THINGS ON EARTH.

A SHORT ACCOUNT OF SOME OF THE WONDERS OF THE WORLD—MARVELS OF NATURE—STUPENDOUS WORKS THAT HAVE BEEN ACCOMPLISHED BY MAN.

The highest range of mountains is the Himalayas, the mean elevation being estimated at from 16,000 to 18,000 feet.

The loftiest mountain is Mount Everest, or Guarisanker, of the Himalaya range, having an elevation of 29,002 feet above the sea level.

The largest city in the world is London. Its population numbers 3,020-871 souls. New York, with a population of about 1,250,000, comes fifth in the list of great cities.

The largest theatre is the New Opera House in Paris. It covers nearly three acres of ground. Its cubit mass is 4,287,000. It cost about 100,000,000 francs.

The largest suspension bridge will be the one now building between New York and Brooklyn. The length of the main span is 1,595 feet six inches; the entire length of the bridge 5,989 feet.

The loftiest active volcano is Popocatepetl—"smoking mountain" thirty-five miles south-west of Peubla, Mexico. It is 17,784 feet above the sea level, and has a crater three miles in circumference and 1,000 feet deep.

The largest island in the world, which is also regarded as a continent, is Australia. It is 2,500 miles in length from east to west, and measures 1,950 miles from north to south. Its area is 2,984,287 square miles.

The longest span of wire in the world is used for a telegraph in India over the river Kistnah, between Bezorah and Sectanagrum. It is more than 6,000 feet long, and is stretched between two hills, each of which is 1,200 feet high.

The largest ship in the world is the "Great Eastern." She is 680 feet long, 83 feet broad, and 60 feet deep, being 22,927 tons builders, 18,915 gross and 13,344 net register. She was built at Millwall, on the Thames, and was launched January 31, 1857.

The biggest trees in the world are the mammoth trees of California. One of a grove in Tulare county, according to measurement made by members of the State Geological Survey, was shown to be 276 feet high, 106 feet in circumference at base, and 76 feet at a point 12 feet above the ground. Some of the trees are 376 feet high and 34 feet in diameter. Some of the largest that have been felled indicate an age of from 2,000 to 2,500 years.

The largest university is Oxford in England, in the city of the same name, fifty-five miles from London. It consists of twenty-one colleges and five halls. Oxford was a seat of learning as early as the time of Edward the Confessor. University College claims to have been founded by Alfred.

The largest body of fresh water on the globe is Lake Superior, 400 miles long, 160 miles wide at its greatest breadth, and having an area of 32,000 square miles. Its mean depth is said to be about 900 and its greatest depth about 200 fathoms. Its surface is about 635 feet above the level of the sea.

The most extensive park is Deer Park in the environs of Copenhagen, in Denmark. The inclosure contains about 4,200 acres, and is divided by a small river. The largest pleasure ground in America, and one of the largest in the world, is Fairmount Park, Philadelphia, which contains 2,740 acres.

The highest monolith is the obelisk at Karnak, in Egypt. Karnak is on the east bank of the Nile, near Luxor, and occupies a part of the site of ancient Thebes. The obelisk is ascribed to Hatasu, sister of Pharaoh Thothmes III, who reigned about 1,600 B. C. Its whole length is 122 feet, and its weight 400 tons. Its height without pedestal is 108 feet 10 inches.

The biggest cavern is the Mammoth Cave, in Edmonson County, Ky. It is near Green River, six miles from Cape City, and about twenty-eight miles from Bowling Green. The cave consists of a succession of irregular chambers, some of which are large, situated on different levels. Some of these are traversed by navigable branches of the subterranean Echo River. Blind fish are found in its waters.

The longest tunnel in the world is that of St. Gothard, on the line of railroad between Lucerne and Milan. The summit of the tunnel is 980 feet below the surface at Andermatt, and 6,600 feet beneath the peak of Kastelhorn, of the St. Gothard group. The tunnel is 26½ feet wide and 19 feet 10 inches from the floor to the crown of the arched roof. It is 9¼ miles long, 1⅛ miles longer than the Mount Cenis tunnel.

The largest inland sea is the Caspian, lying between Europe and Asia. Its greatest length is 760 miles, its greatest breadth 270 miles, and its area 180,000 square miles. Great Salt Lake, in Utah, which may properly be termed an inland sea, is about 90 miles long and has a varying breadth of from 20 to 35 miles. Its surface is 4,200 feet above the level of the sea, whereas the surface of the Caspian is 84 feet below the ocean level.

The largest empire in the world is that of Great Britain, comprising 8,557,-658 square miles, more than a sixth part of the land of the globe, and embracing under its rule nearly a sixth part of the population of the world. In territorial extent the United States ranks third, containing 3,580,242 square miles, including Alaska; in population it ranks fourth, with its 50,000,000 of people. Russia ranks second, having 8,352,940 square miles.

The largest bell in the world is the great bell of Moscow at the foot of the Kremlin. Its circumference at the bottom is nearly 68 feet, and its height more than 21 feet. In its stoutest part it is 23 inches thick, and its weight has been computed to be 443,772 pounds. It has never been hung, and was probably cast on the spot where it now stands. A piece of the bell is broken off. The fracture is supposed to have been occasioned by water having been thrown upon it when heated by the building erected over it being on fire.

The largest desert is that of Sahara, a vast region of northern Africa, extending from the Atlantic Ocean on the west to the valley of the Nile on the east. The length from east to west is 3,000 miles, its average breadth about 900 miles, its area 2,000,000 square miles. The town of Timbucto, about eight miles from the Niger River, is surrounded by desert, but at a distance of a few days' journey to the northeast and north are the oases of Mabrook and Arawan. Rain falls in torrents in the Sahara at intervals of five, ten and twenty years. In summer the heat during the day is excessive, but the nights are often cold. In winter the temperature is sometimes below freezing point.

SIMPSON, HALL, MILLER & CO.,

WALLINGFORD, CONN.

—MANUFACTURERS OF—

Artistic and Useful Hollow Ware,

BUSINESS CHANGES FOR MAY.

S. J. Petley, Arthur, jeweler, sold out to J. B. Tait, and moved to Lindsay. J. B. Tait, jeweler, Bowmanville, moved to Lindsay and succeeds S. J. Petley. W. J. Ryckman, jeweler, Thedford, has removed to Parkhill. J. & W. Allan, stoves and tins, Ailsa Craig, dissolved partnership; James continues alone. McLean Bros., Brandon, Man., dissolved; Arthur continues. J. J. Radford, jeweler, Winnipeg, compromised at 30 cents, secured. James M. Kean, jeweler, Digby, N. S., burned out; no insurance. McIntyre and Griffin, hardware, Oakville, dissolved; Samuel Griffin continues. D. N. Germain, hardware, &c., West Lynne, Manitoba, gone out of business. S. R. Lennox, tins, &c., burned out and dead. Hatch & Brother, Hardware, Toronto and Whitby; S. B. Hatch of this firm dead. Andrew W. Carter, jeweler, Pictou, N. S., away. H. D. Heuson, watches, &c., burned out. Albert Foster, tins, &c., Leamington, burned out; H. J. Woodside, jewelry, &c., Portage La Prairie, assigned in trust.

BUSINESS NOTES.

The revised assessment of Toronto for the present year shows a total value of $62,160,184.

The total assessment of Brantford is $3,931,170, against $3,701,200 last year. A gain of six per cent.

A New Enterprise.—Messrs. Hemming Bros., late of Montreal, have started a factory at 52 Adelaide Street, Toronto, equipped with the most improved machinery for manufacturing cases and trays of every description for jewelry and silverware. We wish them every success.

The steamers *Magnet* and *Spartan* so long known as of the Richelieu and Ontario line, between Hamilton and Montreal, have been sold to ply on Georgian Bay, we understand, in connection with the Toronto, Grey & Bruce Railway, and the Owen Sound Steam Navigation Co.

The hegira of Toronto Jewelers seems to have already set in, no less than half a dozen having started for the European markets. Amongst those who have gone or soon start are Messrs. Smith, Carrier, McNaught, and Segsworth. We trust they may all have a good time, and buy themselves rich before they come back.

The celebrated Brooklyn bridge was formally opened on the Queen's Birthday. The following is the schedule of tolls: One cent each for foot passengers; five cents for one horse and a man; ten cents for one horse and vehicle; twenty cents for all two horse vehicles; five cents each for neat cattle, and two cents each for sheep and hogs. The amount expended to 30th April is $14,629,379.69.

We had a very pleasant visit a few days ago from Mr. Thorpe, of the firm of Hagstoz & Thorpe, manufacturers of the celebrated "Jas. Boss" patent stiffened gold case. Mr. Thorpe visited this city with a view towards pushing the sales of the "Boss" case by an extensive system of advertising, and his efforts in this direction will no doubt be of great benefit to the trade, by posting the public thoroughly as to what are the distinctive features and merits of the "Boss" case. The general verdict of the Canadian Jewelry trade is that the "Boss" case *is the boss case*, and a long way ahead of all competitors.

The Bell Telephone Co. is arranging for the construction of a line of wire connecting Kingston with Toronto, Hamilton, and Western points. Some of the company's officers have gone over the road between Kingston and Odessa, and laid out the route. On the line from Kingston to Belleville, the most difficult section in Ontario, a great deal of blasting will be required. The line will connect Odessa, Napanee, Deseronto, Belleville, Trenton and other points between Cobourg and Kingston. It is intended to begin operations about June 1st.

Mr. Arbage, the employé of Messrs. P. W. Ellis & Co., who was arrested by that firm for stealing goods from their factory, and who was allowed out on bail by the Magistrate, has since jumped his bail and cleared out to the land of the free and the home of the knave. Mr. Arbage was a first-class workman, who, if he had kept in the strict path of honour, would have risen to almost any position in the gift of his employers, but by his foolish and suicidal action he has once again proved the truth of the old adage that "Honesty is the best policy."

Early Thursday morning, May 17th, the jewelry store of G. N. Asselstine, Gananoque, was entered by burglars. The entrance was effected by the front door, the lock of which was picked. The safe stood a few feet from the door, and the thieves drilled a hole into it near the lock, but failed to get it open. They then knocked off the inner knob, and punched out the wheels of the lock. Inside the safe were two iron vaults; these were taken to the back yard and broken open with a sledge. Over sixty watches belonging to customers were taken, and between twenty-five and thirty new ones—many of them valuable. Over $2,000 worth of jewelry and about $100 in cash was taken. A blacksmith's sledge, chisels, and a punch were found in the yard, covered with straw. A large quantity of silverware in the window and the show cases was not disturbed.

WORKSHOP NOTES.

Ruby Pin.—If it is necessary to tighten a ruby pin, set it in asphaltum varnish. It will become hard in a few minutes, and be much firmer and better than gum shellac, as generally used.

Tempering Brass.—Brass is rendered hard by hammering or rolling; therefore, when you make a thing of brass necessary to be tempered, you must prepare the material before shaping the article. Temper may be drawn from brass by heating it to a cherry red, and then simply plunging it into water, the same as though you were going to temper steel.

Potato Celluloid.—According to a Vienna journal, a substance may be produced from potatoes possessing the properties of celluloid. For this purpose the peeled potatoes are boiled for 36 hours in a fluid consisting of 8 parts sulphuric acid and 100 parts water, then dried between blotting paper and relieved of the superfluous water by pressing. Pipe bowls are at present made therefrom in France that can barely be distinguished from real meerschaum, and billiard balls are likewise made from it by strongly pressing.

Coloring Copper.—To produce a dark-browned color upon copper, take the white of an egg, beat it into froth, add a little boiled or rain water, and add to this mixture *caput mortuum* (red oxide of iron) color; rub them well together in a mortar, and sufficiently thick until the color covers, and may be applied. The copper article is to be pickled and simply washed; no sand must be used, else the color adheres badly. The latter is next applied with a brush until it covers the surface; it is then dried by fire, the article is gently rubbed with a soft rag and *caput mortuum* powder, and finally hammered with a hammer with polished face.

Watches Losing Time.—Should a watch lose time from the action of the balance spring, pin the latter into the stud, so that that part, the part of the eye immediately emerging from the collet, and the center of the collet, are in a line; then you will have the spring pinned in, in equal terms, as it is called by those who are versed in the higher branches of springing. Bring the watch to time by adding to or taking from the balance, and poise it; try the watch with the 12 up for two hours, then with the 6 up for two hours, then lying down for the same time; the trials here described will be sufficient if the watch has seconds; keep the curb pins close, so as to allow the spring only a little play; the vibration of the balance should be $1\frac{3}{4}$ turns, or $1\frac{1}{2}$ lying.

Repairing Cylinder Watches.—It frequently happens that the cylinder edges are worn off, and it does not pay to put in a new cylinder; the watch may, nevertheless, be put into keeping a good rate by altering the escapement. Look at the cylinder and see if there is room either above or below the old wears to shift the action of the wheel. If the wheel holes are of brass, make one a little deeper, and put a shallower one on the other side—this may perhaps be sufficient. This must be done according as you want your wheel up or down. If the holes are stone, shift your wheel on the pinion by a new collet, or turning away more of the old one, as the case may require. If you raise your wheel, see that it works free of plate and top of cylinder, and that the web of wheel clears the top of passage. This last fault may be altered by polishing the passage a little wider, if the rub is slight. If shifted downward, see to freedom at the bottom of the cylinder, etc.

Chain Running off Fusee.—In the first place, you must look and ascertain the cause of the difficulty. If it results from a chain being too large, the only remedy is a new chain. If not too large, and yet it runs off without apparent cause, change it end for end—that will generally make it go all right. In cases where the channel in the fusee has been damaged and is rough, you will be under the necessity of dressing it over with a file of the proper size and shape. Sometimes you will find the chain naturally inclined to work away from the body of the fuzee. The best way to remedy a difficulty of this kind is to file off a very

this Trade Mark is stamped on all Knives, Forks, Spoons and other flat ware of our manufacture.

The A 1 Goods are Standard Heavy Plate, and XII signifies that in addition the articles have an extra quantity of Silver on all the parts most exposed to wear.

The Meriden Britannia Company have been awarded the highest premiums wherever exhibited, from the WORLD'S FAIR, 1863, to the PRESENT TIME, and the high reputation of our Goods throughout the world has induced other makers to imitate our Trade Marks and name as well as our designs, and as many of our patrons have, through a similarity of names, purchased inferior goods under the impression that they were our manufacture, we are compelled to ask especial attention to our Trade Marks.

THE FACT THAT OUR NAME AND TRADE MARKS ARE BEING SO CLOSELY IMITATED SHOULD BE A SUFFICIENT GUARANTEE TO THE PUBLIC THAT OUR WARES ARE THE BEST IN THE WORLD.

WE RE-PLATE OLD WORK AND MAKE IT EQUAL TO NEW.

little from the outer lower edge of the chain for its entire length; this, as you can see, will incline to work it on, instead of off. Some workmen, when they have a bad case, and a common watch, change the standing of the fuzee so as to cause the winding end of its arbor to incline a little from the barrel. This, of course, cannot do otherwise than make the chain run to its place.

How to Regulate a Watch Quickly.—The following is a practical method for regulating a watch in a few minutes, also to put in a new balance spring, of the right size and regulated perfectly, in a watch without running it: First ascertain how many vibrations the watch beats in one minute, by counting every other vibration, and comparing that time with a well-known watch or regulator. In general, Swiss watches beat 18,000 in one hour, viz., 300 in one minute. American watches also, either 18,000 or 16,200, or 270 beats per minnte, and the English lever 14,400, or 240 per minute. If there is any doubt, it is better to count up leaves and teeth and ascertain the right number, but cases that watches beat odd numbers are scarce. Having ascertained the right number, examine the balance carefully for one or two minutes, counting every vibration from right to left, and in the meantime examine the regulator or clock, to see when one minute is up. If the watch is well regulated, the number of vibrations must be exactly half of the regular first number, viz., 150, 135, or 120, as every other vibration has been recorded to facilitate the observation. If not so, move the regulator right or left until a perfect coincidence comes. To pick up a new balance spring after having recorded the right number of beats—either by the old spring or by the number of the train—lay first the spring with its centre well in the centre of the cock jewel, and having ascertained where the coil will enter between the curb pins of the regulator, note the place. Stick to the pivot of the balance a small round piece of beeswax; then stick to the centre of the spring, so as to establish a temporary but firm connection of the two pieces, and having pinched with the tweezers the balance spring indicated by the regulator pins, cause it to vibrate gently; then count the vibrations for one minute, and when you have a spring that will produce nearly the required number of beats, pin it to the collet and cause it again to vibrate, moving the tweezers backward or forward until the right number of beats is produced; with another pair of tweezers pinch the balance spring about one-eighth of an inch back of the regulating point, so as to counterbalance the gain produced by the regulator pins, and bend the wire slightly, which is the place where the hair spring must be pinned to the stud. Having then trued up the spring, proceed to put the regulator to the right place, by using the way indicated in the beginning of this article, and the work is done. Success is certain when the operation has been carefully performed. The balance must be made to vibrate on some hard and well polished substance, so as to keep up the vibration to about the standard of regular running. A little practice will soon enable the watchmaker to change a balance spring very quickly, and without any trouble whatever.

SCIENCE NOTES.

A Turin jeweler has made a tiny boat forming a single pearl, which shape it assumes in swel and concavity. Its sails is of beaten gold, studded with diamonds, and the binnacle light at its prow is a perfect ruby. An emerald serves as its rudder, and its stand is a slab of ivory. Itweighs less than half an ounce; its price is $5,000.

A pittsburg firm has commenced the manufacture of glass shingles, which are to be cheaper, stronger, more durable, and more satisfactory in every way than slates or any other roofing substance now used. They will drive the lightning rod men to parts unknown, for glass is such a good conductor of electricity that a fancy rod will be unnecessary on a house roofed with the new shingles. A city full of houses roofed with highly coloured glass would present a beautiful sight.

Cheap diamonds by colouring may be made to look like gems, and the unwary are easily deceived thereby. The process is now about a year old. The trick is performed by dipping the diamond in a preparation of analine dye. This can easily be detected by washing the stone with soap and water. Within a month, however, the sharpers have added a preparation of gum arabic, which successfully stands the soap and water test. The only way the latest deception can be detected is to wash the stone with ammonia. The colouring of diamonds is causing thousands of dollars of loss to innocent people.

The Archdeacon of Melbourne relates that during the epoch of the great gold fever he had a curate whose duty it was to officiate at some of the gold diggings. On Sunday mornings he preached at one set of shanties, and then walked eleven miles to another village for evening service. Half way across the plain stood a solitary tree, where he used to rest and eat his frugal dinner. For two years he had done so, when one day three miners, following his example, sat down to picnic on the same spot, and one of them, on getting up, just tried the soil with his pick, where, at a depth of about two feet, lay a mass of ore which realized $140,000. That curate pondered deeply on what might have been.

The Watchmaker, Jeweller and Silversmith,

A Monthly Illustrated Journal. Published in London.

The Representative Organ of the Watch, Jewellery and Kindred Trades in the United Kingdom.

It is full of original information and thorough practical instruction contributed by the leading writers on the various subjects connected with the above trades. The text is well illustrated by wood-cuts, and two supplements of artistic designs for jewellery, etc. accompany each number.

This important Trade Organ, now in its seventh year of publication is in the hands of every British Watchmaker, Jeweller and Silversmith, and is therefore a most valuable medium for manufacturers requiring publicity in Great Britain.

Our list of permanent contributors includes such names as: J U. Poole, Richard Whitaker, Henry Ganney, Moritz Grassmann, J Herrmann, E. J. Watherston, W. H. Singer an ample guarantee for the sterling value of the Journal. Subscription 5s. per annum.

Published by A. FISCHER, 11 Saint Bride Street, London, E. C., England.

Editorial.

DOES IT PAY TO ADVERTISE ?

Does it pay to advertise ? We think it does. Advertising is the soul of any properly conducted business, as it is the motive power of nearly every successful one. Without advertising in these go-ahead times, when everyone is trying to get the start of his neighbour, business would hardly pay, and as a rule the successful merchant can be easily picked out from amongst his fellows by the style and ring of his advertisements. While we are strong advocates of advertising we cannot shut our eyes to the fact that a very great deal of the stuff that passes current for advertising matter is so much bosh, and just so much money thrown away. Advertising, while good if properly done, is a farce when carried out in the ordinary stereotyped fashion, and we think we are not far astray when we say that fully one half of the money spent in this way might as well be thrown in the lake for any good result that springs from it. We hold that every merchant ought to advertise his business thoroughly, but to make this outlay a good investment he should see that it is judiciously expended upon something that will afford him return for his money. In order to help our readers who may have come to look upon advertising as a humbug, because it has not paid them, we offer the following suggestions upon the subject, which may help them somewhat in the future.

1st. *Advertising, to pay at all, requires to be truthful.* First, be sure you have the goods the public want, then fire away and let them know it as soon as possible. Many people spoil good advertisements by promising too much to the public, and thus by creating the impression that they are really giving the goods away, they make them dissatisfied with anything short of such a liberal performance. A merchant, although shewing the best side of his wares, should never under any circumstances allow his imagination to run away with him while wording his advertisements. A lying advertisement is just as bad as a lying salesman, and every merchant knows that when a salesman is once caught in a falsehood his usefulness is gone. "Honesty is the best policy," and in nothing is this more true than in advertising.

2nd. *Don't advertise anything you are not prepared to carry out.* Many merchants make the mistake of advertising bargains and goods they cannot supply except in very limited quantities, the result is that before the public have fairly began to appreciate the force of the advertisement they are out of these goods and bargains, and not only is the public dissatisfied, but the money thus spent is thrown away. Be sure you have the goods to back up your advertisements. Nothing is more annoying to a customer in search of an advertised bargain or special line of goods than to get the information, "just sold out, but we can give you something else equally good value, that would probably suit you as well." To most people this furnishes the idea that the thing advertised was merely a blind to draw customers there, in order to buy other and more profitable goods. This "just out" style of business reminds us very much of a conversation we overheard at our hotel dinner table lately, between two members of a theatrical troupe. Said one to the other, "the worst hotel I ever struck was the one we stayed at in Montreal (naming a well known hotel in that city) the fact is it is at the top of the profession in the 'just out' business. Everything a fellow asked for at the table was 'just out,' and this got to be so monotonous that I thought I would find out if the run was so gigantic as the waiter represented it to be. Next morning the moment the dining room door was opened I walked in, and was luckily not only the first but the only person in the room. After inspecting the 'programme' I ordered a mutton chop and an omlette. 'Just out,' says the waiter. 'Just out,' says I, 'when ? yesterday ?' 'Yes,' says he with a grin, 'we haven't had any for three or four days.' Well, to make a long story short, although they had a most elaborate 'programme,' the only thing they really had was 'ham and eggs' and 'beefsteak,' and on these I had to make my breakfast. This I call a swindle, and the next time you catch our troupe staying at that hotel again you will know it." We think the "just out" principle does not work any better in the mercantile than in the hotel business, and therefore say, be sure and have the goods and bargains to back up your advertisements.

3rd. *If advertising is worth doing at all, it is worth doing well.* A great many merchants think that if they advertise at all, it makes little or no difference how it is done. This is a great mistake, as anyone knows, who has ever thought over the matter intelligently, and had any practical experience in it. There were several important considerations that should always be borne in mind by the advertiser.

(*a*). His matter should be original and attractive. He should, while shunning the sensational, try to make his advertisements as taking to the reader as possible. The more attractive he can make them the more they will be read, and therefore the more he will be benefitted by them. We have known merchants whose advertisements were so original and attractive that they were as eagerly looked for by the public as the news of the day. That man's advertising paid him well.

(*b*). He should take plenty of space. It is a mistake to think that a small space is as good as a large one. As a rule the very small advertisements are lost and the money spent on them thrown away. If you haven't the nerve to pay for sufficient space in which to display your advertisement properly, don't put it in at all. One good striking advertisement will do more good than half a dozen small ones, therefore if you are unwilling to spend so much money, don't put them in so often, but put them in properly when they do go in.

(*c*). Be careful as to the kind of type that is used in your advertisements. Advertisers should always get a proof copy of their advertisements, so as to

make certain that theirs will show up different from any other in the papers. If others use light faced type you should use heavy, and *vice-versa;* this will always make your matter stand out from the rest on a large page, and the chances are that on account of its different appearance it will be more attractive and therefore more widely read.

(*d*). *Change your matter with every issue of the paper.* Some merchants seem to think that one form of advertisement a year is about all that is necessary to make their business ay. They write out a new advertisement in the spring and this goes into the papers week in and week out, until probably the Christmas trade forces them to make a splurge. It is then changed for a holiday advertisement, and this is often allowed to run on till the returning spring stirs their *turgid* blood sufficiently to make them think of something new. We have often seen a special sale of Christmas goods advertised in February or March of the next year, and most absurd it looked. Now this was money thrown away, but it is no worse than many of the advertisements that we see from one year's end to the other, and which might as well be left out for any good that they do. Good, live, successful advertisers always change their matter as often and as thoroughly as possible, their reason simply being that if not changed the people get so used to seeing it that they cease to take any interest in it, and therefore it does them no good. If you want your advertisements to pay you back your money, change them often, and make them as different as you possibly can, both in matter and appearance.

(*e*). Last, but not least, advertise in a good live paper that has a good circulation amongst the very people you want to reach. It would be folly for any dealer in a small backwoods village to advertise his business in any city papers, simply because the paper would not be seen by his customers, and the money would be thrown away, as far he was concerned. Our advice to every one of our readers is to find out what papers will suit them the best, by circulating amongst the largest number of their customers, and then spend their money in accordance with the rules we have indicated above.

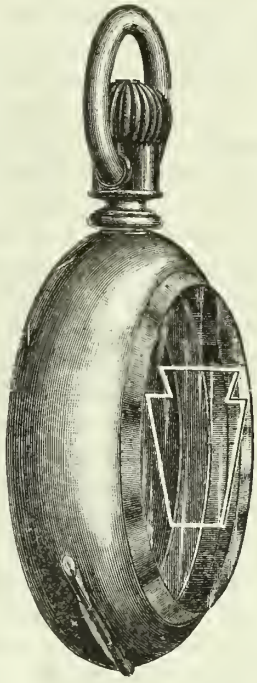
In conclusion we need say but little as to the necessity of advertising. Everyone now acknowledges it to be one of the greatest helps that a merchant can have in any business, and we think that the writer in the "old book" must have had something like this in his mind's eye when he wrote: "There is that which scattereth and yet increaseth, and there is, that witholdeth more than is meet, and it tendeth to poverty." If not intended for modern advertising, it is at least true of it. If it is worth doing at all, it is worth doing well.

WHAT IS A GOOD SALESMAN?

In this age of strong competition, every legitimate help to gain and retain customers has to be resorted to. While there are many things in a merchant's business that act as good helps in this direction, we know of none more useful than good salesmen in one's warehouse. The difference between a good and a poor salesman is so marked in the way in which it affects a business, that we wonder that any merchant ever wastes money on poor or incompetent employees. The fact is that a good salesman builds up, while a poor salesman destroys, a business, and though there may be a great difference in the salaries paid to them, we think it will be conceded by all thinking merchants that the real difference in value can hardly be estimated in dollars and cents. A poor or disobliging salesman is dear at any price, simply because, although he may perform the duties assigned to him, he does not attract new customers or hold the good will of those already made. The smart, obliging salesman, on the contrary, is invaluable, because he takes a live interest in his employer's business and strives in every way to further its success, well knowing that his employer's success will lead to his own advancement.

A good salesman is always an obliging one; he meets his customers with a good natured smile, and while expressing his pleasure at seeing them, manages to interlard his conversation with business enough to keep his hands busily employed.

A good salesman can invariably call his regular customers by name, a faculty which is always well received and adds much to his popularity. To strangers he is particularly attentive, well-knowing that on the first impressions made very much of their after custom depends. He is always polite, but never offensively so, and generally manages to retain the good will of his customers without sacrificing the interests of his employer.



A good salesman is always obliging to customers whether rich or poor, and he serves the ten cent customer with as much politeness as he does the fifty dollar one. Rich or poor it apparently makes no difference to him. It is no trouble to him to show goods, in fact he rather seems to like what often seems to be such a disagreeable task to some salesmen. After selling a customer what they ask for, he invariably directs their attention to the new goods that his employer has for sale, well knowing that if not wanted at present, the time may soon come when they will be in demand, and it is well to keep his customer posted in the goods that they have to sell. This easy, imperceptible way of advertising new goods and pressing customers to buy them, although it does not always succeed at the time, is invariably successful in the long run.

A good salesman never loses his temper no matter how difficult a customer is to handle. He has had experience enough about human nature to know that when once a salesman offends a customer he is twice as difficult to sell to, and that the better humor he can keep in the more goods he can sell, and the easier he can sell them. A sullen or bad tempered salesman is a poor help to a good live business.

A good salesman is never idle. If he has any time to spare he devotes it to getting his stock fixed up and ready for coming sales. A good salesman never has any loafing time, he always finds something to turn his hand to, and having found it, he does it with all his might. His employer's interests are his, and he devotes the whole of his energies to further his employer's business. He takes a pride in his employer's prosperity, and guards his employer's honor as if it were his own. When he makes a promise to a customer he does his level best and leaves no stone unturned to see that it is faithfully carried out. He is faithful in small things as in large things, and studies what is best for the business before his own convenience.

A good salesman is always a sober man. If he uses intoxicating liquors at all, it is so moderately as never to interfere with his business. He well knows that liquor drinking is not conducive to good business habits, and that the less he inclines that way the more competent

THE PERFECT BASCINE

THE

KEYSTONE.

For Sale by all Jobbers.

he we will be for the discharge of his duties, and the higher he will stand in the estimation of his employer.

A good salesman is always to be found at his post, he has no bad habits such as running around the corner "to see a fellow," or wasting his time in idle gossip with idlers who drop in to the store merely to pass away their time. If he has any private business to do, he does it after or before business hours, or if it is impossible to manage it at such times he selects his opportunity more with a view of accommodating the business than himself.

In short the good salesman is a good, square, level headed, gentlemanly fellow, who thoroughly understands his business, and is not ashamed to work at it, and honest enough to try and give his employer full value for the salary he draws. Whatever salary his employer allows him he tries to make himself worthy of, and to do double the amount if necessary. Such a man as we have endeavored to describe (and there are plenty of them in Canada) is a treasure to any employer, and should be encouraged in every possible way.

Selected Matter.

JOHN HARRISON, THE CHRONOMETER MAKER.

Continued from last month.

Not satisfied with his two machines, Harrison proceeded to make a third. This was of an improved construction, and occupied still less space, the whole of the machine and its apparatus standing on an area of only four square feet. It was in such forwardness in January, 1741, that it was exhibited before the Royal Society, and twelve of the most prominent members signed a certificate of "its great and excellent use, as well for determining the longitude at sea as for correcting the charts of the coasts." The testimonials concluded: "We do recommend Mr. Harrison to the favor of the Commissioners appointed by Act of Parliament as a person highly deserving of such further encouragement and assistance as they shall judge proper and sufficient to finish his third machine." The Commissioners granted him a further sum of 500*l.* accordingly. Harrison was now reduced to necessitous circumstances by his continuous application to the improvement of the timekeepers. He had also got into debt, and required further assistance to enable him to proceed with their construction.

Although Harrison had promised that the third machine would be ready for trial on August 1, 1743, it was not finished for some years after. In June, 1746, we find him again appearing before the board, asking for further assistance. While proceeding with his work he found it necessary to add a new spring, "having spent much time and thought in tempering them." Another 500*l.* was voted to enable him to pay his debts, to maintain himself and family, and to complete his machine.

Three years later he exhibited his third machine to the Royal Society, when he was awarded the Gold Medal for the year. In presenting it Mr. Folkes, the President, said to Mr. Harrison, "I do here, by the authority and in the name of the Royal Society of London for the improving of natural knowledge, present you with this small but faithful token of their regard and esteem. I do, in their name, congratulate you upon the successes you have already had, and I most sincerely wish that all your future trials may in every way prove answerable to these beginnings, and that the full accomplishment of your great undertaking may at last be crowned with all the reputation and advantage to yourself that your warmest wishes may suggest, and to which so many years so laudably and so diligently spent in the improvement of those talents which God Almighty has bestowed upon you, will so justly entitle your constant and unwearied perseverance."

Mr. Folkes, in his speech, spoke of Mr. Harrison as "one of the most modest persons he had ever known." In speaking of his own performances he has assured me that, from the immense number of diligent and accurate experiments he has made, and from the severe tests to which he has in many ways put his instruments, he expects he shall be able with sufficient certainty, through all the greatest variety of seasons and the most irregular motions of the sea, to keep time constantly, without the variation of so much as *three seconds in a week*, a degree of exactness that is astonishing and even stupendous, considering the immense number of difficulties, and those of very different sorts, which the author of these inventions must have had to encounter and struggle withal."

Although it is common enough now to make first-rate chronometers—sufficient to determine the longitude with almost perfect accuracy in every clime of the world—it was very different then, at the time that Harrison was occupied with his laborious experiments. Although he considered his third machine to be the *ne plus ultra* of scientific mechanism, he nevertheless proceeded to construct a fourth time piece, in the form of a pocket watch about five inches in diameter. He found the principles which he had adopted in his larger machines to apply equally well in the smaller; and the performance of the last surpassed his utmost expectations, but in the meantime, as his *third* timekeeper was, in his opinion, sufficient to supply the requirements of the Board of Longitude as respected the highest reward offered, he applied to the Commissioners for leave to try that instrument on board a royal ship to some port in the West Indies, as directed by the statute of Queen Anne.

It was not until March 12, 1761, that he received orders for his son William to proceed to Portsmouth, and go on board the "Dorsetshire" man-of-war to proceed to Jamaica. But another tedious delay occurred. The ship was ordered elsewhere, and William Harrison, after remaining five months at Portsmouth, returned to London. By this time John Harrison has finished his *fourth* timepiece—the small one—in the form of a watch. At length William Harrison set sail with this timekeeper from Portsmouth for Jamaica in the "Deptford" man-of-war, on November 18, 1761, and returned to England on March 26, 1762. On the arrival of the ship at Port Royal the timekeeper was found to be only five and one-tenth seconds in error, and during the voyage of over four months, on its return to Portsmouth in the "Merlin," it had only erred one minute fifty-four and a half seconds. In the latitude of Portsmouth this only amounted to eighteen geographical miles, whereas the Act requires that it should only come within the distance of thirty miles or minutes of a great circle. One would have thought that Harrison was now clearly entitled to his reward of 20,000*l.*

But the delays interposed by government are long and tedious. Harrison

had accomplished more than was requisite to obtain the highest reward. It was necessary for him to petition Parliament on the subject. Three reigns had passed: Anne had died; George I. and George II. had reigned and died; and now in the reign of George III. an Act was passed enabling Harrison to obtain the sum of 5,000*l*, immediately as part of the reward. But the Commissioners differed about the tempering of the springs. They required a second trial of the timekeeper. Two more years passed, and Harrison's son again departed with the instrument on board the "Tartar" for Bardoes on March 28, 1765. He returned in about four months, during which time the instrument enabled the latitude to be ascertained within *ten* miles, or *one-third* the required geographical distance.

Harrison memorialized the Board again and again. In the following September they virtually recognized his claims by paying him on account 1,000*l*. In February, 1765, the Board entered a minute on their proceedings that they were "unanimously of opinion that the said (Harrison's) timekeeper has kept its time with sufficient correctness, without losing its longitude in the voyage from Portsmouth to Barbadoes beyond the nearest limit required by the Act of 12th of Queen Anne, but even considerably within the same." They would not give him the necessary certificate, though they were of opinion that he was entitled to be paid the full reward.

Harrison was now becoming old and feeble. He had attained the age of seventy-four. He had spent forty years in working at the Chronometers. He was losing his eyesight and could not afford to wait much longer.

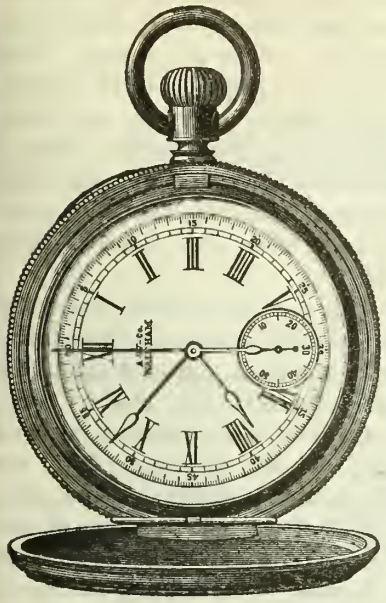
Full little knowest thou, who hast not tried,
What hell it is in suing long to bide;
To lose good days that might be better spent;
To waste long nights in pensive discontent;
To spend to-day, to be put back to-morrow,
To feed on hope, to pine with fear and sorrow.

But Harrison had not lost his spirit. On May 30, 1765, he addressed another remonstrance to the Board, containing much stronger language than he had up to this time used. "I cannot help thinking," he said, "but I am extremely ill-used by gentlemen who I might have expected a different treatment from; for if the Act of the 12th of Queen Anne be deficient, why have I so long been encouraged under it, in order to bring my invention to perfection? And, after the completion, why was my son sent twice to the West Indies? Had it been said to my son, when he received the last instruction, 'There will, in case you succeed, be a new Act on your return, in order to lay you under new restrictions, which were not thought of in the Act of the 12th of Queen Anne'—I say, had this been the case I might have expected some such treatment as I now meet with.

"It must be owned that my case is very hard; but I hope I am the first, and for my country's sake I hope I shall be the last, that suffers by pinning my faith upon an English Act of Parliament. Had I received my just reward—for certainly it may be so called after forty years' close application of the talent which it has pleased God to give me—then my invention would have taken the course which all improvements in this world do; that is, I must have instructed workmen in its principles and execution, which I should have been glad of an opportunity of doing. But how widely this is different from what is now proposed, viz., for me to instruct people that I know nothing of, and such as may know nothing of mechanics; and, if I do not make them understand to their satisfaction, I may then have nothing!

"Hard fate indeed to me, but still harder to the world, which may be deprived of this my invention, which must be the case, except by open and free manner in describing all the principles of it to gentlemen and noblemen who almost at all times have had free recourse to my instruments. And if any of these workmen have been so ingenious as to have got my invention, how far you may please to reward them for their piracy must be left for you to determine; and I must set myself down in old age, and thank God I can be more easy in that I have the conquest, and though I have no reward, than if I had come short of the matter and by some delusion had the reward!"

The Right Honorable the Earl of Egmont was in the chair of the Board of Longitude on the day when this letter was read—June 13, 1765. The Commissioners were somewhat startled by the tone which the inventor had taken. Indeed, they were rather angry. But Mr. Harrison, who was in waiting, was called in. After some rather hot speaking, and after a proposal was made to Harrison which he said he would decline to accede to "so long as a drop of English blood remained in his body," he left the room. Matters were at length duly arranged. Another Act of Parliament was passed, appointing the payment of the whole reward of £20,000 to the inventor; one moiety upon discovering the principles of the construction of his chronometers and assigning his four chronometers (one of which was styled a watch) to the use of the public, and the remaining moiety on sufficient proof on the correctness of the chronometers.



Mr. Harrison, accordingly made over to the Commissioners of Longitude his various timekeepers, and deposited in their hands correct drawings, so that other skilful makers might construct similar chronometers on the same principles. Harrison expressed the greatest readiness to explain his inventions, and to subject them to every required test. Indeed, there was no difficulty in making the chronometers, after the explanations and drawings which Harrison had published. An exact copy of his last watch was made by the ingenious Mr. Kendal, one of Harrison's apprentices. This chronometer was used by Captain Cook during his three years' circumnavigation of the globe, and was found to answer as well as the original. This, as well as Harrison's chronometer, is still to be seen at the Royal Observatory, and both are in good going condition.

Although Harrison did not obtain the remaining moiety of his reward until 1767, two years after the above-mentioned meeting of the Board, his labors were over, his victory was secured, his prize won. Notwithstanding his delicacy of health he lived a few years longer. He died in 1776, at his house in Red Lion Square, in his eighty-third year. It may be said of John Harrison that by the invention of his chronometer he conferred an incalculable benefit on science and navigation, and established his claim to be regarded as one of the greatest benefactors of mankind.

S. Smiles.

ABALONE JEWELRY.

Probably of all the "shell-fish" of the Union, after the oysters, clams, and the scallop, none holds a more important place commercially than the ear-shells, or abalones; and if edible properties are not made the scale of judgment, the n

CHRONOGRAPH

STOP WATCHES

MADE TO

START, STOP AND FLY BACK,

WITH OR WITHOUT SPLIT SECONDS,

MANUFACTURED BY THE

AMERICAN WATCH CO'Y,

WALTHAM, MASS.

By Patented Improvements in Construction, and considerable Diminution of the Parts required, as well as by the application of American Machinery, the AMERICAN WATCH CO. has so simplified the manufacture of Chronograph Watches as to greatly reduce their cost. They can now be obtained at prices which make them the MOST DESIRABLE timepieces for Sporting Purposes, AS WELL AS FOR GENERAL USE. Dealers can depend upon these goods giving satisfaction, as they will not require the constant repairs, nor subject the dealer to the annoyance experienced in most of the foreign watches of this class. In case of accidents, Duplicates of Broken Parts can be furnished by return mail. Cased complete in 16 Size Gold Open Face and Hunting Cases. (Open Face made to wind at figure XII.)

ROBBINS & APPLETON, General Agents,

NEW YORK.

they hold the first place. The ear-shells belong to conchological genus *Haliotis*, and there are almost a hundred species of them scattered about the world, our own Atlantic shore being almost the only coast where the halioits is not represented. In many countries the animals are eaten, and everywhere the shells are highly valued. This groupe of mollusks, therefore, has surely enough interest about it to fill a leisure column.

In Southern California the gathering of haliotis affords employment to a large number of persons, and a considerable commerce has sprung up. There the mollusks are called "abalones"—a word of doubtful Spanish-Indian derivation. The business is chiefly in the hands of the Chinese, and that it should be so is very natural. At home the Chinese were, and yet are, accustomed to dry the flesh of their own haliotis (which is adundant from Malaya to Kamtchatka) as a food luxury. Finding in California practically the same mollusk, they at once began to gather the abalones for the sake of the meat, the surplusage of which they dried in salt, and shipped home to China at a good profit. After a time white men began to pick up the shells thrown away, and to work them over into ornaments and objects of jewelry. Thus apprised of their value, the Chinamen also saved all the shells they got, and soon found this half of the catch brought more money than the dried flesh. For three or four years past the business in these shells has been extensive, but fears are felt that the mollusks may soon become exterminated. Late information concerning the abalone fishery has been received by the United States Fish Commission from Messrs. D. S. Jordan and W. N. Lockington, their agents on the Pacific Coast. They tell us that the abalone-producing region extends from San Francisco to Lower California, San Diego being the principal depot outside of the capital, receiving largely from Mexican waters. For a long time Mexico paid no attention to this trespass upon her shores, but now she charges a license duty of sixty dollars a year upon every abalone boat from the United States.

Abalones thrive best among rocky, weed-grown crags and reefs alternately exposed and submerged with every tide, and in a warm climate. They are vegetarians, feeding upon the sea vegetables, of which there is always an abundance in such places. Their fleshy base or "foot," upon which the convex, ear-shaped shell is carried, concealing and protecting the vital organs, is "very large, rounded at the ends, and fringed with thread-like tentaculæ, which, when the animal is protruded from the shell below the surface of the water, are gently swayed."

They move very little, and with great moderation of gait. The broad muscular foot is adapted less to locomotion than for adhesion, and so strong is the force with which they cling to the rock—withdrawing their protracted lobes, and squatting flat down at the least disturbance—that it often is exceedingly difficult to detatch them, even with the aid of the trowel or spade which is usually carried by the fishermen. Another method is to pour over them a small quantity of warm water, and then give a sharp push sideways with the foot. The warm dauche surprises and disgusts them into relaxation.

The tenacity of life in this mollusk seems equal to its hold upon the rocks. Mr. R. C. Stearns, of San Francisco, writes that he has frequently removed the animal from the shell, by means of a sharp knife, and thrown it back into the water, when "it would at once descend and place itself in its normal position upon a rock, to which it would adhere with apparently as much tenacity as before it was deprived of its shelly covering."

The meat of abalone has long formed an article of food in various parts of the world—the Channel Islands, French coast, and along the Mediterranean (where they beat it to make it tender), Senegal, the South-sea Islands, Malaya, China, Japan, and our Pacific coast. It was described by old Athenæus, centuries ago, as "exceedingly nutritious, but indigestible," and holds its reputation well. Mexico exports it to us under the custom-house heading "dried oysters." In San Francisco and the coast towns it is rarely eaten except by Chinese, who are the only ones who gather it. A simple process of salting and drying is all that is necessary for its preservation, in which shape it is sent to China. In order to get a ton of meat, about six tons of living animals must be collected, but there is no telling how many individuals this represents. After being cured, abalone meat is worth from five to ten cents a pound, and the value of the crop which reached San Francisco last year approached $40,000, distributed among some hundreds of men. The coast is now so stripped of the haliotis that the Chinese fishermen are compelled to resort to unfrequented islands, transportation to which is afforded them by American capitalists, who take their pay in shells, while the Chinese retain the meat.

The trade in abalone shells, indeed, is of twice as much importance, financially, as that in the flesh, since it amounted to nearly $90,000 last year. Some Americans also are engaged in this business, and the finishing off of the shells for market is wholly in their hands.

The shell of the haliotis is one of the most brilliantly beautiful in its interior of any known. The lustrous, iridescent curves of the nacre, reflecting ever-varying and prismatic colors in endless profusion delight every eye. In aged specimens the part to which the adductor muscle is attached is raised above tho level of the rest of the interior, and presents a roughened or carved surface of irregular shape, often fancifully imitative of some other object. The writer has seen one which thus contained a singularly correct profile or medallion of Napoleon I.

Outside, the shells are usually rough and unattractive, except to the marine zoologist, who finds them supporting a small forest of minute vegetable and animal forms, and harboring microscopic life of great interest. A curious case of a larger parasite is mentioned by Mr. Stearns, where a haliotis had been attacked by another mollusk—a boring bivalve known as *navea*, which had cut its way through the shell. Advised of this enemy, the haliotis had defended itself by adding coating upon coating of nacre as a bulwark between him and his foe, until, as the *navea* progressed, a large knob was built in the interior of the abalone's shell.

The shells are usually sent to San Francisco from the lower counties in the rough, and are the means of considerable speculation among the captains of coasting ventures. The price paid for them by merchants varies greatly; an average last year would be $50 or $60 a ton. From San Francisco they are shipped both to China and to the Eastern States. In China they are broken up and used for inlaying in connection with the lacquer work for which the Chinese

☞ Press the Crown as in any ordinary case, turn bow to the right to open Bezel, and to the left to open back.

are famous. The mosaics of Europe are often adorned by the same means, and various arts are served by their glittering fragments. It was with pieces of this sort of shell that those wonderfully beautiful inlaid screens from Holland, representing mooulight landscapes, etc., which attracted so much attentiou at the centennial exhibition, were produced.

Many of our shells are sent to Europe, there to be polished, with the help of acids, until they shall be as lustrous outwardly as inside, and then are re-shipped to the United States to serve as mantel ornaments, soap basins, match boxes, card-cases, receptacles for flowers, etc. The same work is done to some extent in San Francisco, and many are there manufactured into gold-mounted earrings and brooches, shawl pins, and various toilette articles, particularly ladies' high hair-combs of great elegance and costliness.

One dealer also, at San Diego, California, polishes these shells himself, and sells them to tourists for from twenty-five cents to five dollars, or sends them to the East by mail in "nests" of four to six. The young of one sort are cleaned with the aid of hydrochloric acid, but the usual method with aged shells is to grind away the epidermis by hand, by rubbing upon stones. It is too delicate work to trust to machinery, lest holes should be made in the thin pearly underlayers.

A peculiarity of haliotus shells is the line of four to ten round holes along the ridge at one side. It is through these apertures that the mollusk gets the fresh water necessary to its breathing when it sits close down upon a rock, and none can flow in under the edges of the tight shell. A similar provision exists in the "key-hole" of the limpet, and in the "notch" in the shelly lip of a large number of whorled shells, like the whelk, conch, etc. Through these holes also the abalone protrudes tiny waving feelers that warn him of the approach of any danger in time to withdraw underneath his shield.

To the Indians of Californuia the haliotis was very valuable. They wore it as an ornament about their necks and in their hair. The tribes of the interior were so attracted by its glitter that they were willing to pay a large price in barter to possess it. A horse was not an infrequent exchange for a fine specimen. I have seen these shells, rudely polished, dangling in the braids of Indian braves, and around the necks of vain, glorious squaws of every tribe from New Mexico northward to the far upper Missouri plains. The coast tribes also made from it beads and coin of different values and shapes, all formed from the red-backed abalone (*Heliotis rufescens*), which is not the common species of commerce. Mr. Stephen Powers, describing this money, under the name of "uhllo," says:

"The uhllo pieces are of a uniform size on the same string, they do not mix them. The dollar pieces are generally about one and one-quarter inches long, and an inch wide; the smaller about as long, but narrower. The Indians are very ingenious and economical in working up the abalones; wherever there is a broad, flat space, they take out a dollar piece; where the curve is sharp, a smaller one. They especially value the outer edge of the whorl or lip, where the color is brilliant, and these they are obliged to cut into twenty-five-cent pieces. You will see that the uhllo is cut into pieces of different sizes, and even pieces of the same size vary in value according to their brilliancy. * * All the money that I have seen was strung on grocery twine, but they often use sinew of various kinds, also the outer bark of a weed called milkweed about here.

"The uhllo necklace has three or four strings of very small glass beads above the shells, forming a band about one quarter of an inch wide, which encircles the neck."

This uhllo was not the only shell-money of the west coast of Indians. The tusk-shell (*Dentalium*) of the northern tribes, and the "colcol" (*Olivella*) and "hawock" (*Pachyderma*) of the southern region, played important parts as a circulating medium of exchange in trade. Altogether, however, I think I am right in asserting that the haliotis is among the most important and best economized of all American mollusks.—*Harper's Weekly.*

ON THE USE OF SPECTACLES.

No more mischievous mistake can well be made than the one which is involved in the prevalent idea that the use of spectacles should be put off as long as possible. This becomes evident at a glance as soon as it is understood that the case is one of incapacity of the lens of the eye to adapt itself to near vision in consequence of loss of accommodating power. The continued effort of the delicate mechanism of the eye to accomplish a task which is beyond the measure of its capacity, must necessarily be attended with an injurious, as well as painful strain. Squinting is one of the evil consequences which are apt to ensue if such fruitless efforts are long persevered in. Mr. Carter remarks upon this point in the following monitory strain: "The effect of accommodation is precisely that of adding a convex lens to the passive eye, and so when accommodation fails, we can supply its place by adding the required lens by art. To do this is the ordinary function of the spectacles which are required by all people, if their eyes were originally natural, as time rolls on. The principles on which such spectacles should be selected is that they should be strong enough to be effectual, and they should be used as soon as they are required. Opticians often supply glasses which are too weak to accomplish what is needed, and which leave the eyes still struggling with an infirmity from which they ought to be entirely relieved, while the public frequently endeavor to postpone what they look upon as an evil day, and do not obtain the help of glasses until they have striven hard and fruitlessly to do without them. These are important practical errors. It cannot be too generally understood that spectacles, instead of being a nuisance, or an incumbrance, or an evidence of bad sight are to the far-sighted a luxury beyond description, clearing outlines which were beginning to be shadowy, brightening colors which were beginning to fade, intensifying the light reflected from objects by permitting them to be brought closer to the eyes, and instantly restoring near vision to a point from which, for ten or a dozen years previously, it had been slowly and imperceptibly, but steadily declining. This return to juvenility of sight is one of the most agreeable experiences of the middle age, and the proper principle, therefore, is to recognize loss of near sight early, and to give optical help liberally, usually commencing with lenses of +1.25 or +1.50, so as to render the muscles of accommodation not only able to perform their task, but able to perform them easily. When, as will happen after a while, in consequence of the steady decline of accommodation, yet more power is required, the glasses may

be strengthened from half a dioptic to a dioptic at a time, and the stronger glasses should at first be taken into use only by artificial light, the original pair, as long as they are found sufficient for this purpose, being still worn in the day-time." The common prejudice against using spectacles as soon as the impairment of the sight begins to be observed with advancing age, appears to have unfortunately arisen from the fact that there is a serious disorder of the eye, known as glaucoma, which is attended with obscure vision, resembling that of old sight, but which is nevertheless altogether different in its essential condition. The mischief in glaucoma usually proceeds with an accelerated pace. Stronger and stronger glasses are used on account of the assistance which each fresh accession of strength at first gives. But the sufferer in the end becomes hopelessly blind, and the result is then erroneously attributed to the influence of the glasses which have been employed, although as a matter of fact this had nothing whatever to do with the issue of the case. The injury to the sight in such instances is really due to an over-tense state of the eye-ball having been set up, and to the destruction, in consequence of abnormal pressure, of the delicate nerve-structures within. Mr. Carter unhesitatingly affirms that the habitual use of strong magnifying glasses is not injurious to ordinary eyes, and he supports his opinion in this particular by referring to the circumstance that watchmakers, who commonly employ magnifying glasses in their work, in reality enjoy a very enviable immunity from diseases of the eye. It appears that it is quite an unusual thing to find a working watchmaker among the patients of an ophthalmic hospital. Mr. Carter holds that the habitual exercise of the eye upon fine work, such as these men are engaged in, tends to the development and preservation of the powers of vision, rather than to their injury.—*Edinburgh Review.*

BUSINESS CHANGES FOR JUNE.

E. Sawtell, Orangeville, hardware stock, advertised for sale by sheriff. S. J. Cohn, jeweler, Winnipeg, assigned in trust. J. B. Laming, Granton, watches, away. James Renton, Lindsay, watches, moved to Peterboro'. W. H. Calder, Stirling, jeweler, burned out. James Milne & Co., hardware, Stirling, burned out. Wm. Smith, Stirling, watches, burned out. Mrs. M. A. Ashall, Toronto, jeweler, sold out to son, Wm. Ashall. Thos. Botterill, Winnipeg, hardware, removing to Medicine Hat. N. Germain & Co., Winnipeg, hardware, assigned in trust. J. J. Radford, Winnipeg, jeweler, sold out by auction. Stirsky & Mylius, Winnipeg, jewelers, sheriff in possession. Larter Bros., Toronto, Tins, &c., assigned in trust. James Chalmers, Strathroy, Tins, &c., assigned, H. G. Levetus, Montreal, wholesale jewelry. assigned in trust. Levetus, Wright & Co., Winnipeg, wholesale jewelers, dissolved and closing out business.

BUSINESS NOTES.

We see our old friend, R. Hadden, Picton, has admitted Mr. Rorabeck into partnership. We wish the new firm every success.

One of the oldest furniture dealers in this city, T. H. Lockington, has failed. He had a a similar experience some years ago, and has never made much headway since.

As was to be expected the opening of the Brooklyn bridge has very sensibly affected the receipts of the ferry-boat companies. The Union Ferry company has already reduced its toll.

J. B. Laflamme, haberdasher, Montreal, has assigned, finding opposition too keen. He compromised in the spring at 60 cents, but this does not seem to have afforded the desired relief. He owes about $4,000, and assets are reported at $3,000.

The announcement is made that Mr. W. A. Douglas, for many years accountant in the Freehold Loan Company has been appointed assistant manager of that institution. Those who are familiar with that gentleman's abilities will agree with us in the opinion that the promotion is well deserved.

Mr. Erastus Wiman, of New York, was, at a special meeting of the Dominion Telegraph Company, held on the 29th, elected a director to fill the vacancy caused by the death of the Hon. T. N. Gibbs. Mr. Thos. Swinyard, who was Vice-President, succeeds to the Presidency, and the Hon. Wm. Cayley takes the Vice chair.

A thief was detected in Montreal the other day in a way as amusing as it is unusual. A laboring man went into Messrs. Jones & Co.'s wholesale establishment, and while no one was looking picked up a $13 alarm clock, put it under his coat and started for the door. He had not reached it, however, when to his dismay, the clock commenced to strike the alarm and attracted the attention of some of the clerks. A constable was sent for at once and the thief arrested and committed.

H. G. Levetus, a wholesale dealer in jewelry and optical goods at Montreal, and also doing business in Toronto as Levetus, Morris & Co., and in Winnipeg as Levetus, Wright & Co., has assigned in trust. For some time past he has experienced a difficulty in getting financing facilities. Losses in connection with the Winnipeg business too, assisted to bring about his failure. Liabilities are not yet ascertained, but as he showed a very fair surplus early in the spring, it is thought the estate should realize pretty well.

An offer of 17½ cents on the dollar, payable in three months, and 17½ cents in six months unsecured, has been made by J. S. Cohn, a jeweler in Winnipeg; this his creditors have not yet accepted. His affairs show a deficit of from $1,000 to $12,000.——Another jewelry firm, Stirsky and Mylins, is in difficulties, the sheriff having been placed in possession of the premises. Stirsky, the senior member, went west ostensibly for the purpose of disposing of surplus stock, but in reality took all the better class of goods with him and is said to have left for the United States. The estate will probably be sold.

WORKSHOP NOTES.

Gold Tinge.—A bright gold tinge may be given to silver by steeping it for a suitable length of time in a weak solution of sulphuric acid and water, strongly impregnated with iron rust.

Melting Gold.—In melting gold use none other than a charcoal fire, and during the process sprinkle saltpetre and potash into the crucible occasionally. Do not attempt to melt with stone coal, as it renders the metal brittle and otherwise imperfect.

Jeweler's Cement.—Put into a bottle two ounces of isinglass and one ounce of the best gum arabic, cover them with proof spirits, cork loosely and place the bottle in a vessel of water, and boil it till a thorough solution is effected; then strain for use.

Gold and Silver from Textiles.—Cut into pieces the gold or silver lace, tie it tightly, and boil in soap lye till the size appears diminished; take the cloth out of the liquid, and after repeated rinsings of cold water, beat it with a mallet to draw out the alkali. Open the linen, and the pure metal will be found in all its beauty.

Cold Silvering of Metals.—Mix 1 part of chloride of silver with 3 parts of pearl ash, 1½ parts common salt, and 1 part whiting; and well rub the mixture on the surface of brass or copper (previously well cleaned), by means of soft leather, or a cork moistened with water and dipped in the powder. When properly silvered, the metal should be well washed in hot water, slightly alkalized, then wiped dry.

Refining Silver.—After having rolled the silver, cut it into narrow strips, and curled it to prevent its lying flat, the pieces are dropped into a vessel containing two ounces of good nitric acid diluted with one-half ounce pure rain water. When the silver has entirely disappeared, add to the two and a half ounces of solution nearly one quart of pure rain water. Then sink a sheet of clean copper into it; the silver will collect rapidly upon the copper, and you can scrape it off and melt it in bulk.

Soft-Soldering Articles.—Moisten the parts to be united with soldering fluid; then, having joined them together, lay a small piece of solder upon the joint, and hold over your lamp, or direct the blaze upon it with your blowpipe until fusion is apparent. Withdraw them from the blaze immediately, since too much heat will render the solder brittle and unsatisfactory. When the parts to be joined can be made to spring or press against each other, it is best to place a thin piece

MARK.

OBSERVE

this Trade Mark is stamped on all Knives, Forks, Spoons and other flat ware of our manufacture.

The A 1 Goods are Standard Heavy Plate, and XII signifies that in addition the articles have an extra quantity of Silver on all the parts most exposed to wear.

The Meriden Britannia Company have been awarded the highest premiums wherever exhibited, from the WORLD'S FAIR, 1863, to the PRESENT TIME, and the high reputation of our Goods throughout the world has induced other makers to imitate our Trade Marks and name as well as our designs, and as many of our patrons have, through a similarity of names, purchased inferior goods under the impression that they were our manufacture, we are compelled to ask especial attention to our Trade Marks.

THE FACT THAT OUR NAME AND TRADE MARKS ARE BEING SO CLOSELY IMITATED SHOULD BE A SUFFICIENT GUARANTEE TO THE PUBLIC THAT OUR WARES ARE THE BEST IN THE WORLD.

WE RE-PLATE OLD WORK AND MAKE IT EQUAL TO NEW.

of solder between them before exposing them to the lamp. Where two smooth surfaces are to be soldered one upon the other, you may make an excellent job by moistening them with the fluid, and then, having placed a sheet of tin foil between them, holding them pressed firmly together over your lamp till the foil melts. If the surfaces fit nicely, a joint may be made in this way so close as to be almost imperceptible. The bright looking lead, which comes as a lining of tea boxes, is better than tin foil.

Tinting Metallic Surfaces.—It is found that metallic objects may be attractively colored by immersing them in a bath formed of 630 grains of lead acetate dissolved in 3,450 grains of water, and warmed from 88° to 90° F. This mixture gives a precipitate of lead in black flakes, and when the object is plunged into the bath, the precipitate deposits upon it; the color acquired depends on the thickness of the skin, and uniformity of tint is insured by gradual treatment. There is thus imparted to iron a bluish aspect like steel; zinc, on the other hand, become brown. By employing an equal quantity of sulphuric acid in the place of the lead acetate, and warming a little more that in the first case, common bronze may be colored red or green with a very durable skin. And not only this, but beautiful imitations of marble are obtained by covering bronze objects, warmed to 100° F., with a solution of lead thickened with gum tragacanth, and afterward submitting them to the action of the above-named precipitate of lead.

SCIENCE AND OTHER NOTES.

Postal Cards with Answer.—Great Britain also has joined those countries of the World's Postal Union, to which postal cards with answers may be sent. The postage is 5 cents.

The Tuning Fork.—Experiments are instituted in Prussian artillery target practice to ascertain the velocity of the ball within the cannon by means of the vibration of a tuning fork, which records them by means of a small pin fastened to one of its arms; it has also been much used lately for measuring the smallest intervals of time. The French colonel, Severs, experimented with it, and obtained very satisfactory results. The tuning fork, set in motion by the explosion of the powder, makes from 2,000 to 3,000 vibrations per second, which are marked upon a sheet of paper; not visible, however, to the naked eye, and seen only by assistance of the microscope.

Imitation Watches.—About a century ago the fashionable world wore two watches, the chains and charms of which dangled toward the right and left upon an embroidered vest. This fashion was also adopted by the ladies; but since it was generally too costly to wear two real watches, people were mostly satisfied with a real watch to the left and an imitation one to the right. The latter was frequently ornamented with gold, silver, jewelry or miniature painting; the face of others was provided with a dial. Some were satisfied with wearing a needle cushion instead, in fact all manners of excess were committed in this line. The most costly imitations were ornamented with stars and allegories, composed of jewels, which could be revolved by means of special wheel-work. People who had no money to spend for such luxuries were satisfied with wearing a simple gold or painted case. Only the Chinese at present wear two watches, disposed of in two small embroidered pockets.

Leclanche.—George Leclanché was one of those inventors, who, by a single happy invention, earned a world's reputation. His cell or element is known everywhere where the telegraph has penetrated, and the inventor's demise last fall in Paris awakened the sympathy of the entire scientific world. He obtained his education in the "Ecole Centrale des Arts et Manufactures," and obtained a position in the laboratory of the "Compagnie de chemins de fer de l'Etat," as chemistry engineer for the railroad companies of France. He remained here until 1867, when he obtained a patent for his celebrated battery. He experimented in the latter part of his life to devise a system of time division for annotating chronometers (chronograph) by means of electricity. Leclanché reached an age only of 43 years.

A World-moving Word.—The scientist who, according to irrefutable evidence, first made use of the expression "electricity," which is threatening to depose steam from its universal sovereignty, was an English doctor by the name of William Gilbert, who lived in the sixteenth century. He published in 1600, in London, a work by the title "De Magnete, magnetfcisque corporibus et do magno magnete tellura Physiologia nova." In this work, which already contains the main principles of the earth's magnetism, occurs the following sentence: "Vim illam electricam nobis placet appellare quae ab humore provenit." William Gilbert, born in Colchester in 1540, died Nov. 13, 1603, in London. He was confidential physician to Queen Elizabeth, and afterward to King Jacob I., and a very intimate friend of Lord Bacon. His work, "De Magnote," contains a number of interesting experiments. It met with less publicity and fame in England than in foreign countries, because, since 1628, five editions appeared in Germany, three in France, and only two in England.

The Watchmaker, Jeweller and Silversmith,

A Monthly Illustrated Journal. Published in London.

The Representative Organ of the Watch, Jewellery and Kindred Trades in the United Kingdom.

It is full of original information and thorough practical instruction contributed by the leading writers on the various subjects connected with the above trades. The text is well illustrated by wood-cuts, and two supplements of artistic designs for jewellery, etc. accompany each number.

This important Trade Organ, now in its seventh year of publication is in the hands of every British Watchmaker, Jeweller and Silversmith, and is therefore a most valuable medium for manufacturers requiring publicity in Great Britain.

Our list of permanent contributors includes such names as: J. U. Poole, Richard Whittaker, Henry Ganney, Moritz Grassmann, J. Herrmann, E. J. Watherston, W. H. Singer an ample guarantee for the sterling value of the journal. Subscription 5s. per annum.

Editorial.

WATCHMAKERS, ATTENTION.

The letter of "Hamilton Jeweler" in another column suggests to us the possibility of very much good being done by an interchange of ideas amongst Canadian watchmakers.

It certainly seems strange to us that jewelers and practical watchmakers in this country apparently take but little interest in the new and useful inventions that are continually cropping up in this line of business, and that might with great advantage to the trade, be discussed in such a paper as THE TRADER.

The difference between Canada and the United States in this respect is very marked, and we are sorry to see that the comparison is not at all favorable to us.

Take up almost any one of the many journals published in the United States in the interests of watchmakers and jewelers, and you will find in it ample evidence of the *Espre du corps* that American watchmakers have in their profession. Amongst these letter contributions from practical men, may be found some of the best and ablest articles contained in the paper, and these are entitled to all the more weight when it is remembered that they are principally the result of, in many cases, long and varied experience. Watchmaking is a *science*, and as everyone knows that ever had anything to do with it, requires long years of patient study in order to master its intricacies and understand thoroughly its principles. Indeed, so difficult is the thorough mastery of the science of horology that but few ever attempt such a thing, and those who do are a kind of *rara avis* amongst their fellow workmen. A thoroughly skilled workman, as everyone knows, can always command the highest wages and need never be out of work; in fact, his services are in constant demand, and he has immeasurable advantages in every way over any ordinary workman.

Now, while we have many first-class watchmakers in Canada, it is no disparagement to the trade to say that we have also a great many inferior workmen who might be very much improved if they would but take the time and pains to improve themselves in their trade. If anything were wanting to prove this assertion, the mass of "botched" work that is continually pouring into our city trade shops would abundantly confirm it. In no way can such a desirable improvement be carried out than by an interchange of ideas upon subjects of vital importance to the craft.

For example, a watchmaker in some country village finds a difficulty in doing a certain kind of work, and he has no older head near by to get advice from, if he were to clearly state his want in some trade journal, some one perhaps that had experienced the same difficulty and overcame it, would enlighten him. Those who had made any useful discovery in any branch of the business would have a medium by which to communicate it to others, and in this way the general standing of the watchmaking trade might be very much improved. Many of our best workmen are self-taught mechanics, and they, more than any others, will be able to estimate the advantage that a little friendly advice furnished in this way, at the right moment, may do.

Now, watchmakers of Canada, is it not time that you were stirring yourselves in the direction of discussion and improvement? Are you, as a class, less intelligent than your fellow-workers on the other side of the line? if not, why do you allow yourselves to drift along with the stream when you have such grand possibilities before you? Wake up and prove that you are live workmen, and not mechanical Rip van Winkles, whose ideas and abilities are just what they were when they first learned the trade.

Ventilate every new matter, and keep abreast of the times, take improvements by the forelock, and don't let them tread on your heels.

We have plenty of intelligent and educated watchmakers, let us hear from a few of them on live subjects; let those that want information be not afraid to ask for it, and if they do we are satisfied that some brother craftsman will be able and willing to give it to them.

To all we would say don't hide your light under a bushel. If some one asks a question, and you can answer it intelligently, do so by all means and you will do yourself no harm, and probably the enquirer a great deal of good.

As we have said before, the columns of THE TRADER are always open for such purposes as the above, and we shall be only too glad to help along such a laudable object by every means that lies in our power.

Now then fellow craftsmen let us hear from you.

THE FUTURE OF THE AMERICAN WATCH TRADE.

As everybody in the watch and jewelry trade knows, for the past four years it has been almost an impossibility to get as many low priced movements as the requirements of business demanded. We have often been asked, why is this, why can't we get the goods we want for our trade as easily and as cheaply as we did formerly?

The reasons, we think, are not far to seek. From 1873 till 1879 may safely be said to have been all years of depression, and bad years for business in general. The period before that was unusually prosperous, and as everyone knows, one particularly suited to an expansion in every line of business.

The watch industry, like every other, is governed by circumstances; in other words it is regulated by the law of supply and demand, and has to ebb and flow with the tide of commercial prosperity. Looking at the subject in the light of these generally acknowledged principles of trade, we cannot help being struck with the precision with which the watch industry has obeyed the ups and downs of mercantile life. We have often expressed the view, that as far as any one business can indicate the state of prosperity in any country, the watch and jewelry trade is certainly the most reliable for that purpose.

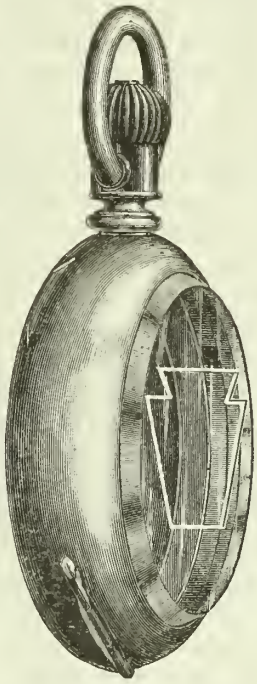
Indeed so accurately does it register the advance or decline of the general prosperity, that it may be pretty safely taken as a reliable mercantile barometer.

Watches and Jewelry are articles of luxury, and when the country is prosperous, and people generally are making money, they meet with a ready sale; the commercial barometer then indicates "fair weather." On the other hand when times become depressed, money scarce, and people barely able to obtain the necessities of life, these goods become almost a drug in the market and can hardly be sold at any price; the commercial barometer then indicates "bad weather, look out for squalls." We do not for a moment wish to be understood as meaning that good and bad times come and go because the jewelry and watch business is prosperous or otherwise, but simply that the watch and jewelry business is lively or depressed because the general prosperity is in the same condition. In other words, the success or otherwise of this particularly sensitive business is purely a result of good or bad times as the case may be.

This being so anyone can see at a glance that in the prosperous decade previous to 1873, trade in this line was good simply because the demand was good, and the public having money to spare were of the opinion that they could afford these luxuries. During the period of depression from 1873 to 1879, the great mass of the population spent all they earned in obtaining the necessities of life, and but few had anything to spare for its luxuries. The demand thus being cut off or very much reduced, the natural result of over-production inevitably followed, and this line of manufactures soon became a drug in the market. But says some one, why did not the watch factories shut down, or limit their production when the dull times came on? We answer for the same reason, that it is very hard for a man to stop suddenly when he is going at full speed down hill. A watch factory, like any other factory, has to keep its machinery going up to its full capacity in order to produce paying results, and they would probably lose more by shutting down or curtailing their production than by keeping up their former output, and reducing their prices to within a fraction of cost. The watch companies evidently looked at it in this light, for we do not remember of a single factory either shutting down or trying to limit their output. The result was however strictly in accord with the well recognized law of supply and demand; in spite of extra inducements in the shape of greatly reduced prices and better terms, in spite of the fact that the reduction of the American watches sensibly diminished the importation of Swiss goods (thus in some measure making up for the restricted consumption by giving them the almost unopposed control of a formerly divided market), the consumption could not be forced up to the level of production, and as a consequence, the end of the depressed period found them holding heavier stocks of manufactured goods than at any former period of their history.

With the advent of good times came another change, and one for the better. The purchasing power of the nation became so much increased by the general prosperity, that the demand for watches not only rose to a level with the production, but soon left it far behind. The result has been, that although the watch factories have tried to keep pace with the demand in two ways, (1) by raising their prices, and (2) by increasing their capacity, they have been utterly unable to do so, and to day some of them have on their books orders sufficient to keep them running at their full capacity for twelve months to come. This, too, in spite of the fact that as soon as American makers advanced their prices, Swiss goods again began to be imported in large quantities. The prosperity of this country for the past five years has been something wonderful, and it is little to be wondered at, if when the watch manufacturers had the ball at their feet, they not only tried but have fully succeeded in recouping themselves for their losses or rather want of profit during the preceding period of depression.

This we think is why the watch companies are neither able nor willing to supply the lower grades of goods wanted by the trade generally, nor willing to offer to them the concessions in prices and terms they formerly enjoyed.



"Every dog has his day" is a homely proverb but a true one; it was the merchants chance during the period of depression, it is the manufacturers now, and who can wonder or blame them if they take advantage of it. When one man has an article that he wants badly to dispose of to another person who is unwilling to buy, the inducements and concessions are generally on the side of the seller; but when the case is reversed and the seller is the indifferent party, then the concessions must come from the side of the buyer, and he must not consider himself aggrieved if he fails to get the favors he formerly obtained when the seller was in embarrassed circumstances and could not help himself. In short the whole matter comes back as we have previously asserted, to the law of supply and demand.

And now ask many of our readers, what about the future, will watches always remain as scarce and as dear as at present? Bearing in mind the effect of this unalterable law, we unhesitatingly answer, no. Just as soon as hard times come again, or the output surpasses the consumption, just so soon will prices drop down to or below their lowest former figures. Already the indications of hard times are apparent by the greater number of failures, both in Canada and the United States, and the reduced volume of trade in both these countries, and the result has at this early stage made itself felt upon the watch business. That the slight falling off of trade that has been felt by the retail trade has affected the manufacturers is evidenced by the fact that one factory that one year ago (the height of our prosperous era) was said to have orders enough on hand to last it for three years, is now said to have gained two years on its orders, and that it could now catch up in twelve months. Were dull times to come on we fancy even the half of this would either level up their orders or else ruin most of the wholesale houses on whom they would unload their unsaleable stock.

Watch manufacturers are at present apparently whistling to keep their courage up, if we may judge by the elaborate computations they make public at stated periods, and all pretty much in the same view, viz., proving by figures that the population of this country is increasing so rapidly that if every factory in the United States were to double its capacity, they could not possibly keep pace with the demand. These fancy theories are all first-class as long as times are good and sales brisk, but just as soon as depression again lays its blighting hand on the industries of the country and cripples its purchasing power, these gentlemen will find their very plausable theories blown to the winds.

Another factor, we think, in this ques-

THE PERFECT BASCINE

DUST PROOF

THE

KEYSTONE.

For Sale by all Jobbers.

tion is the advance of Swiss competition in this country. Switzerland, the land of natural born watch makers and cheap labor, has no intention of allowing herself to be driven from the markets of this continent without knowing the reason why. Although for a time she has been out-distanced by the improvements in American watch making machinery, she will surely overcome this disadvantage by adopting the same helps to manufacture. When they do then it will be "Greek meeting Greek," and although neither may be forced to go to the wall, the result of the competition will be a large increase in the supply and a consequent reduction of prices all along the line.

We do not know that a reduction in the price of watches would add anything to the prosperity of the retail trade, as we have shewn, such a reduction is generally the result of hard times when goods are cheap because they cannot be easily disposed of. On the whole we think we would prefer, and it would be better for the trade, to have the good times continue, for they could then sell the goods they bought at a fair profit even supposing they had to pay a slightly advanced price for them.

Correspondence.

"A GOOD SUGGESTION."

Editor Trader:

Sir,—In looking over your valuable journal, which I think, without flattery, is certainly most creditable to Canadian enterprise, I have often been struck by the fact that the jewelry trade, for whom it is principally intended, do not take more interest in it. It seems to me that we have in The Trader a medium for the interchange of ideas bearing on our business that we should not fail to take advantage of, and that if the editor of The Trader would allow us a certain amount of space in the columns of his paper, it might develop a good deal of latent talent among our jewelers that they never before suspected.

I see no reason why we in Canada should not be fully abreast of our craftsmen in the States and England in this particular, and we all know that jewelers in both these countries not only write for their journals, but write well on nearly every subject connected with the trade. I would like to know, Mr. Editor, what you think of this idea, and if practicable, would you give us the small amount of space we could use regularly? Trusting to get a favorable answer from you, and that the trade in Canada, generally, will fall in with this idea of mutual improvement by interchange of ideas.

I beg to remain, yours truly,

"Hamilton Jeweler."

Selected Matter.

THE DIAMOND DRUMMER.

The diamond drummer, according to a recent writer, is a real genius. He is said to be less encumbered by baggage than any of the drummer fraternity. Every ounce that he carries is worth a good deal more than its weight in gold. He is the aristocrat of the drummers. A sharp and experienced member of this profession is quite sure to be a partner in the house he travels for, or to receive a handsome salary and expenses, and a liberal commission on his transactions. The best diamond drummer does not expect to rely on regular customers for his trade. He is a sort of guerrilla, who instinctively knows where to find the best purchasers for his goods, which presupposes an accurate knowledge of the business and its possibilities in all parts of the country. He must be a thorough expert in gems, having a full knowledge of their production, the fields where they are found, their cost, color, shape and lustre, and be able to detect the slightest variation in the shade of precious stones. A rare diamond which he has once seen he will never forget, no matter what change may have been made in its setting. He can tell by its cutting whether the work was done by an American or a European lapidary, and some experts can even recognize the cutting of special artists, in the forms and fashions which distinguish the work.

But the diamond expert is also proficient in the fashions and styles of jewelry. He must know the most appropriate settings for all precious stones, for these add greatly to the saleable value, especially of the diamond. The diamond setter should be an artist of great taste and powers of discrimination. An ordinary jeweler is apt to destroy the beauty of the stone by clumsy workmanship, or to hide its brilliancy by an attempt to display his own skill. The real artist who knows and loves the diamond for its rare brilliancy and purity, will surround it with such delicate yet luxurious materials and colors as shall enhance its perfection and beauty. By virtue of such knowledge as this the diamond drummer is often enabled to buy a rare stone, which appears absolutely ugly in the setting that some blacksmith has given it, but which in another garb shines out resplendently, challenging the admiration of the world. In regard to prices of all kinds of gems he is never at a loss. He does not need to place a diamond on the scales to determine its weight; a single glance at it will establish its quality and value.

The diamond drummer's chief customers are jewelers and the diamond dealers out of town. New York is the centre of the American diamond trade, but there are several dealers in Chicago who make a specialty of this business, and several experts are employed here. Some diamonds are imported direct to Chicago, the wearers of diamonds being on the increase here. A considerable number of Chicago ladies have very valuable sets of diamond jewelery, in which they have invested not alone for display and dress purposes, but for the safety of their property. It is a prevalent idea that diamonds will always bring their value in cash; and this is true to a certain extent, though subject to trade modifications. "Mine uncle," for instance, while charging interest on money he will loan on a thousand dollar set at five or six per cent. a month, will value the property at not more than $500, and it is sometimes difficult to find purchasers for expensive stones. The drummer, who actually knows the market, is the useful middleman in such transactions. From the local dealer he receives orders for special sets of single ornaments which they have been commissioned to procure. This special order business is a very important feature of the trade. It often takes months to fill one satisfactorily, and one drummer spent two years in getting a match for a solitaire ear-ring for a lady who had lost one of hers, obtaining in the end what he had every reason to believe was the identical diamond she had been bereft of. Most drummers carry a little sack with all the way from $10,000 to $50,000 worth of unset stones in it, for the purpose of matching lost ones and furnishing sets to satisfy the caprice of ultra particular buyers.

The sales to jewelers are generally of mounted gems of the newest fashions. Commonly the jeweler buys these for

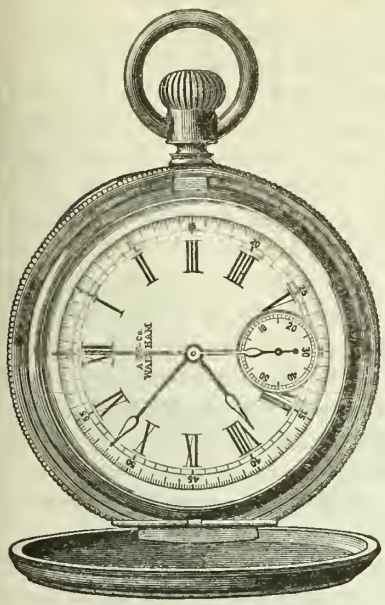
samples, and has them copied by his own workmen, with his own materials. As the sample sets are of the most expensive order, this branch of the trade is a very profitable one, in spite of the limits set to its proportions. But private buyers frequently deal with the diamond drummer, too. Well known drummers, on arriving at a place where they propose operating, generally get a personal in the local papers, stating that so and so, the well-known and popular diamond dealer, etc., is in town, at such and such a hotel, and private custom soon finds him out. There is in Baltimore an old man, who presents the appearance of a veritable vagrant, who is a regular buyer of diamonds for investment. He is a heavy speculator in grain, and turns every dollar he wins into diamonds. Where he hides them no one knows, but several attempts to rob him have failed to discover their whereabouts. He is popularly reputed to bury them, but where their grave is will probably remain a mystery till he goes to his own, if, indeed, it is discovered then.

Apropos of robbery, that of a diamond drummer is very rare, though it does occur now and then. He travels heavily though not obtrusively armed, does not go to bed in his hotel with the door unlatched, and never carries his stock with him in strange places at night. By observing such simple, common-sense rules of precaution, he preserves himself from most of the perils that menace a man known to be travelling with a store of wealth about him, and generally lives to a good and opulant old age. When he is robbed his loss is generally irredeemable, for even the cleverest diamond drummer could not swear to his own jewels with the settings removed or a facet or two recut. He would recognize them to his own satisfaction, but it would require a jury of diamond experts to convict a thief on the slender evidence he could adduce.—*Exchange.*



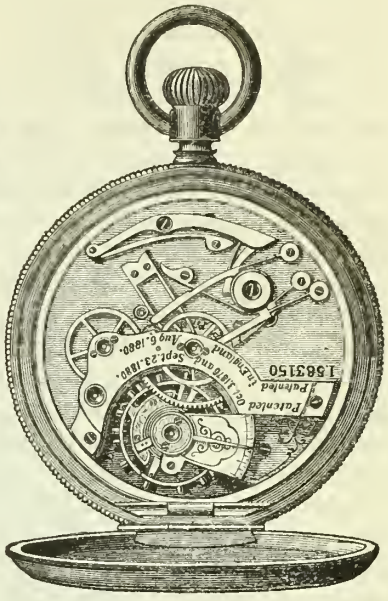
ROMANCE OF OLD GOLD.

There has always been more or less reverence attached to old and venerable specimens of wrought gold, and poets and novelists have dealt lovingly with the theme. As a matter of fact, however, from a business standpoint, old samples of wrought gold are usually worth just what their value is after emerging from the melting pot. But associations and pleasant memories have, with many a value that money cannot buy, and in the hands of this class of persons, old samples of wrought gold, that have been heirlooms in families for ages, become inestimable treasures. There is, however, much exaggeration relative to gold workers that the public lends a ready ear to. For instance we have heard the story frequently repeated that an enterprising man once gathered the dirt in John Street, including the sweepings from many jewelers' shops, and on assaying the dirt, recovered over $10,090 worth of old gold waste. The craft must indeed be wealthy when it can throw such a bonanza into the street. Of course the story is absurd, but there are many such in existence to which a credulous ear is lent. A reporter of a daily paper recently published the result of his investigations upon the subject of old gold, and below we give the substance of what he says on the subject :

Passing through John street, the other day, a glare of a brilliant light blazed blindingly in the reporter's eyes. It was the reflection of the rays of the noonday sun from an eccentric mass of white metal in the dirty little window in a dirty little shop which was sandwiched between two of the handsome silversmiths' stores, like some skulking tramp being taken care of by a brace of stalwart guardians of the peace. How the solar shaft ever pierced the grimed panes with sufficient power to create such a responsive radiance is a mystery. It was as much as the reporter could do to make out that the white metal was a mass of crucible silver, of the most fantastic and charming filagree structure, its surface fretted like the frosting on a winter morning window in designs which might have been made in fairy-land. In trays and heaps all around it was a confused mass of the most hetrogeneous articles of ornaments and utility, or rather of bygone ornaments, whatever their present utility might be, of both antique and modern pattern, but all of one of the two precious metals, and all run to one common character of seed. There were long chains festooned all about and coiling in heaps like sleeping serpents, battered bracelets and rings varying in style from the plain wedding circlet to the aristocratic seal strung like dried apples on long wires. A golden sword hilt and a gold arabesqued scabbard, several daggers with tarnished silver grips, ornamental scrolls wrenched from gun stocks and revolver butts with the rivets still sticking in them, brooches without pins, earrings without hooks, watch cases, old coins, medals and badges of every description. A couple of crucibles were crammed with settings from which the jewels had been torn, and there was a bushel or so of the same spoiled jewelers' work in two battered black silver pitchers, whose dinted but portly corporosities bore an engraved crest with a graceful monogram and the date of 1742. These heirlooms come to a common level with their frivolous companions, and waiting, like them, for the melting-pot, had the air of dignity about them of two gentlemen of the old school, dropped by misfortune among the proletarian paupers of an almshouse. The flaunting sign in the window, "Old gold and silver bought at the best prices," seemed a wanton insult to them, a fling at their hapless deteriorated age.

The shop inside was, if that is possible, more in want of a purification than the exterior. In its gloomiest corner a red-eyed furnace glowed through a vail of blue charcoal smoke. The ceiling was black and festooned with cobwebs, which made hammocks for the soot and dust to repose in. The walls were black—a smeary, unwholesome black, like the complexion of one of those toilers in a Siberian Lead mine who have forgotten the light of day. There were some cards and price lists gummed to them, but their inscriptions had long since been smudged into illegibility. Over a board counter a bent old man was testing some chains and bracelets with acid, while their vendor stood by and awaited the decision of the dumb detective as to the worthiness of his stock. A florid gentleman was tumbling over the chaotic contents of a boxfull of seals, monograms and the like, which had been deprived of their settings. "It's no use," he observed; "it isn't here, that's certain. I must try another place."

"He has been here every day for a month now," explained the man behind the counter. "His house was robbed lately, and among the articles stolen was a seal ring which had belonged to his family for unnumbered generations. He had hoped that he might come across it here, but I guess his chance is a slim



NEW

CHRONOGRAPH

STOP WATCHES

MADE TO

START, STOP AND FLY BACK,

WITH OR WITHOUT SPLIT SECONDS,

MANUFACTURED BY THE

AMERICAN WATCH CO'Y,

WALTHAM, MASS.

By Patented Improvements in Construction, and considerable Diminution of the Parts required, as well as by the application of American Machinery, the AMERICAN WATCH CO. has so simplified the manufacture of Chronograph Watches as to greatly reduce their cost. They can now be obtained at prices which make them the MOST DESIRABLE timepieces for Sporting Purposes, AS WELL AS FOR GENERAL USE. Dealers can depend upon these goods giving satisfaction, as they will not require the constant repairs, nor subject the dealer to the annoyance experienced in most of the foreign watches of this class. In case of accidents, Duplicates of Broken Parts can be furnished by return mail. Cased complete in 16 Size Gold Open Face and Hunting Cases (Open Face made to wind at figure XII.)

ROBBINS & APPLETON, General Agents,

NEW YORK.

one. If it is worth anything it has long since been sent across the water."

"How do you mean?"

"Simply that the thieves, or rather the deceivers with whom they deal, never try to do anything with that sort of property here; seals, intaglios, cameos and the like, which possess any intrinsic value, are packed off to Europe at once and reset there, while their old settings are melted down. In the same way those stolen abroad find their way to this market. We get a great many valuables of that sort, of course in the legitimate way of trade. They are brought here by people who are hard up, or who do not appreciate them. We make no allowance for them. It is the settings we are after, and we pay for its weight and fineness. The stones go into a heap, and anybody who wants can buy them. We have regular customers in that line—collectors and dealers—who, from time to time, relieve us of our stock. Of course we don't give the stones away, and when by a rare accident, we get any of exceptional value, we get our own price for it, too. But it is not our regular line, and with the general run we don't haggle over the price, unless we have plenty of time to waste."

"Do you take any precautions against being made the purchaser of stolen property?"

"The ordinary one of common sense. It isn't a very difficult thing to distinguish between an honest seller, who has a right to dispose of what he sells, and the other sort. Besides, the thieves don't get a chance to patronize us. They are generally so entangled with fences that the latter get whatever is worth getting, at their own prices, and they do their own melting. The mass of settings there, for instance, comes from various jewelers, who have purchased them for the stones and sold the metal to us. The big jewelers either do their own smelting and refining or send it outside to places like this to be done. If, however, a customer does not turn up whom I think likely to be the off color variety. I simply decline to deal with him. I suppose I have bought stolen property at one time or another. I don't see how anyone in this business can very well help it. But ignorance is my best title to innocence, and I guess I won't suffer very seriously for it."

Here, a little faded woman in widow's weeds came in. She had a little package under her decent dolman, and in a little, quivery voice, explained that she desired to find a market for it. It was a silver baptismal mug, of an old, old style, and bore the inscription, worn by zealous polishing, "To Bella, from Her Godmother, Arabella Matcham, London, 1837." The little woman started as if some one had stabbed her when the mug fell rattling among a heap of silverware tossed from the scale by a careless hand. But she gathered up the few bank notes with eager fingers, and pulled her vail closer about her face as she went out.

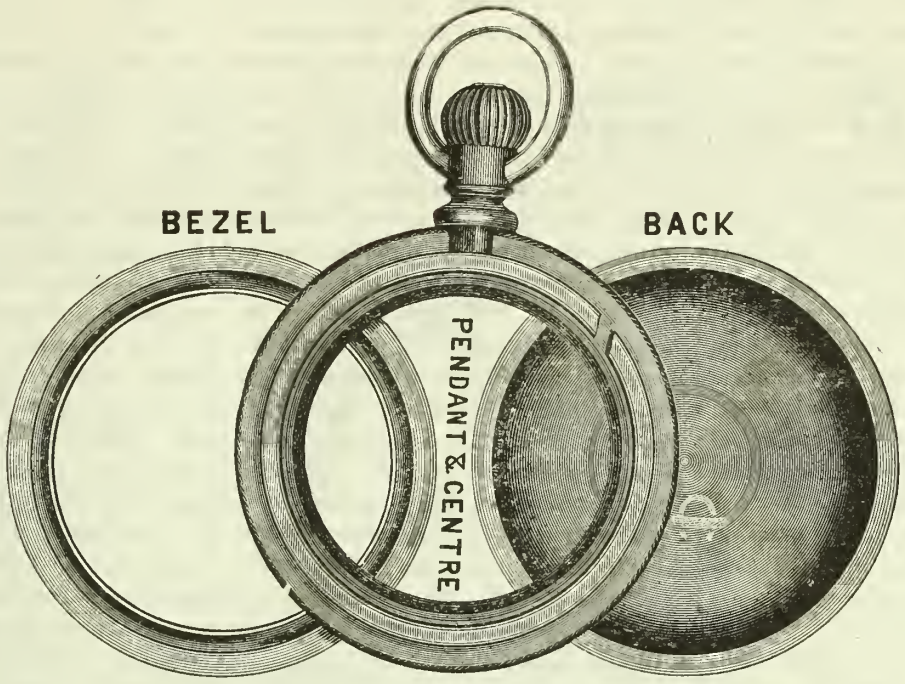
"Some people," the dealer explained, "are as shamefaced about coming here as they would be on a first visit to a pawn shop. And the queerest part of it is that they have all generally been to the pawn shop first. Pawnbrokers won't advance anything like its value on such stuff as this any more than they will on anything else. If the owners only need money temporarily, they take what they can get. But if they are so hopelessly hard up that they are constrained to part with their collaterals for good, they generally find their way to some place where they can get more like their value. We don't pay for workmanship, as I needn't tell you, and that's the biggest part of the jeweler's bill. But we pay honestly for the metal, and as much as we can afford. There's considerable competition in the business now, and the profits are much less than they were when I commenced to smelt.

The prices paid for old gold vary, of course, according to the quality of the metal. Eight karat gold brings from about thirty to thirty-two cents per pennyweight, twelve karat from forty to forty-eight, fourteen karat from fifty to fifty-five, sixteen karat from sixty to sixty-five, and eighteen from seventy to seventy-five. There is very little twelve karat gold in the market. In such low grade gold ranks as eight karat or less, the price paid depends greatly on the character of the alloy and the difficulty of extracting it in refining. If it is exceptionally difficult to separate the silver and copper, the price is merely nominal. Apropos of this fact, it is worth noting that much second-hand jewelry is offered for sale, dating from the first houses of the country, and of a very low grade of metal, indeed almost on a par with cheap factory work. To sum up in simple English, old gold of good quality brings about ten per cent. less than its intrinsic value, that sum constituting the smelter's profitless expenses.

The gold, when it is refined, is run into bars and either sold to manufacturing jewelers or turned over to the Sub-Treasury as bullion. Very little of it goes that way, though. The ornamental uses to which it can be put claim its full service as a rule. The chief source of supply of the smelters is the jeweling fraternity. They not only have large quantities to dispose of through resetting, but most of them trade new-fashioned trinkets for such as are out of date, the latter being rated by weight, and they find their way to the smelter in due course.

Old gold, of course, isn't bought like auction bargains or junk, on the chance of its being worth the purchase. The tests it is subjected to determine its value are extremely interesting. The chief factors in it are the test stone and test key. The former is a whetstone, which one finds on every smelter's counter. The latter is a contrivance on the plan of an old-fashioned fan toothpick, only, instead of being of ivory it is brass. The various points or picks are numbered 8, 12, 14, 16, 18 and 20, and the figures designate the quality of the gold with which they are tipped. When you bring a ring in for sale, say, it is rubbed on the whetstone, to which a few atoms of the precious metal adhere. Then the key, pointed with gold of the fineness at which your ring is estimated or stamped, is used to make its auriferous mark beside it. A drop of muriatic acid and then of sulphuric acid, used *seriatim*, brings out the color of the two marks, and verifies the fineness of the one according to the standard of the test key. When very thick rings or heavy jewelry are offered, the dealers will not venture on a purchase unless they are permitted to cut them and ascertain what they are made of inside.

The most perfect method known for testing coins, it may be interesting to state here, though it has no particular bearing on the subject, is that in use in the Bank of England. The bank never circulates a coin that is a thistle-down's weight under the standard. The sovereigns, as they come to the test are heaped up on a big table, whence they are swept into tubes which are part of a sort of a delerium tremens of machinery operated by a little steam engine. The rolls



The "Excelsior" Patent Dust Proof Case.

PATENTED,

United States,

27th December,

1881.

PATENTED,

Dom. of Canada

28th February

1882.

This is the first and only case made without one grain of solder. Every piece is cut from thesolid metal and pressed into the shape used in the case. This process hardens the gold and silver by the only method known (that is to work it), and is handed to the Trade as hard as is possible to make it, being a great advantage over a case made in the ordinary way, in saving gold and silver by making a case as strong as a much heavier one that has been softened as heat does in soldering on pendant, joints, thumb catches, or joint to swing movement in. Heat not only softens the gold or silver, but warps it out of the shape that the snaps have been fitted to, and it is never perfect after soldering. The Excelsior Patent Dust Proof is never soldered, never heated, is fitted perfectly, and remains perfect. The Excelsior Dust Proof has no joints to wear out or break off. The Excelsior Patent Dust Proof has no spring to break or wear the case. There is no part of the Excelsior Patent Dust Proof that will wear. The Excelsior Patent Dust Proof is the safest case made for protecting the movement—it will never open in the pocket Put an Excelsior Dust Proof in your pocket, bend forward, backward, put yourself in any position you please and the Excelsior is closed tight. In an ordinary case, with springs, by bending forward the case will often open and when the lock-spring is worn, the case is nearly always open.

The Excelsior Patent Dust Proof Case is the strongest, best fitting and most durable case made. Ask your Jobber for the Excelsior Patent Dust Proof. Every case warranted as stamped, 18 kt., 14 kt., 12 kt., 10 kt., United States Mint Assay or Coin Silver, as may be stamped, and every genuine case bears the Trade Mark. The Excelsior Patent Dust Proof Case may be obtained from any of the jobbing houses in the country.

TRADE MARK.

Instructions to Open the Excelsior Patent Dust Proof Case.

First press the crown as in opening an ordinary Hunting Cased Watch, then to open front, turn bow to the right with thumb and finger; to open the back, turn left. To close, turn case back in same position as when case was closed, and snap same as glass bezel on any watch.

of sovereigns pass slowly down these tubes, which traverse the table at a descending grade of thirty degrees, and if they are full weight the coins drop one by one into a box on the floor. But whenever a light piece reaches the lower end of the table a little brass plate pops out of some hidden corner and pushes the defaulter into a compartment of the box where he can't contaminate his honest fellows. Not one is allowed to pass. The sovereigns are then dumped into a sort of barrel organ with steel blades for pipes, whence a turn of a crank drops them out, cut in half and ready for reminting.

In addition to the smelters who suspend their shingles in Maiden Lane and John Street, and in that block of Chambers Street between Chatham and Centre, there are peripatetic speculators in old gold, argonants of the trade who travel all over the country gathering in stock wherever they can find it, and bringing it to New York to dispose of at sufficient profit to make their wanderings pay. These middlemen often pick up some marvelous curiosities in their particular line; historic heirlooms that have spent long generations in country cupboards, and the plate chest of provincial families. But whatever their associations may be, the red-eyed furnace devours them all, and their death incence makes the smelter think hard words as he stirs his pot in the mophitic fumes of a charcoal fire.

The oldest smelting business here is said to be that of G. W. Platt. John Waters' sons continue a business their father founded long before they were born. The Longman establishment is also an old and prominent one. The head of this firm is reputed the greatest expert in metals on the Western continent. His cognizance of his profession is called colossal. His assays in the most delicate and important cases are accepted as final. A reference of a disputed point in practical metallurgy to him is understood to mean its definite settlement, *pro* or *con.*, and no one demurs at his decision. One instance of his fundamental thoroughness in the business is adduced in the fact that he can detect, with rare exceptions, where any article of jewelry which comes under his hands has been made, his knowledge extending not only to the characteristic national styles, but even to the peculiarity of individual workmanship. The gold brick which was donated by California to the Irish Famine Fund was sent to him for assay. He made his report, accompanied by a receipted bill. Some of his assays are said to be marvels of the triumphs of an anylitical brain, and a practiced intelligence over what had been regarded as Gordian knots in the metallurgical annnals. There are numerous famous "crooked" smelters here, men whom only the thief can reach, who have garnered fortune from their pots of "brown soup," as their patrons familiarly christen them. One of them, a little weasened Hebrew, who has for years been a tantalizing mystery to the police, is a regular speculator on Wall street, where he spends his off hours in company with his daughter. The pair are as familiar to that portion of down town as the Stock Exchange itself. The infatuation of the old man is akin to that of a gambler who, after fleecing a victim, goes off to be fleeced himself at his own game. Every dollar he makes in one way he looses in the other, and if theft should become a lost art he would inevitably become a client of the almshouse."

HOW HE CHEATED THEM.

SUCCESSFUL FEAT OF A DIAMOND SMUGGLER.

A well-known diamond smuggler whom the New York Custom House detectives have in vain tried to seize, not long since sailed from Antwerp on the *Rhynland*. A Hamburg detective came over with him to watch him the whole voyage. This clever smuggler wore a thick, black beard and whiskers, and it was suspected that he carried his precious freight concealed in them. One morning not long ago the New York authorities received a despatch from the Hamburg agent, which read:—"R. has shaved his beard. Did not know it till he had sailed five days. He is on the *Rhynland*. He has got 70 large diamonds concealed on his person." As soon as the *Rhynland* was sighted, six Custom House officers steamed down and intercepted her. They looked for the now beardless man. Just as they were about to give up the search a stranger asked, "You are Custom House officers and you look for Rosenburg with the diamonds?" "We are and we do." "That is Rosenberg, and the diamonds are sewed in the lining of his necktie." In another minute a pale, smooth-faced, sallow man was struggling in their hands. His scarf was taken from his neck and carefully explored with a sharp penknife. Twenty diamonds of various sizes were found. His trunk was next rummaged, every necktie searched, and seventy-three diamonds of great lustre discovered. The fellow wept and wrung his hands. When the Custom House officers arrived at headquarters the chief, who held a cablegram in his hand, eagerly enquired, "Did you get Rosenberg?" "Yes, sir." "Where were the stones?" "Sewed in the linings of his neckties." "That's rather strange," remarked the chief. "Here's a Hamburg despatch which says, 'Just learned that R. carried the diamonds between his back and a porous plaster.'" "Here are the diamonds, anyhow," said the leader of the raid, "and we found 'em in the lining of his neckties." The chief looked at the gems, and said:—"Send the jewel expert here." He came, examined the diamonds, shrugged his shoulders, and said:—"Paste, but first-class." Three frantic officers spent the afternoon tracing Mr. Rosenberg. They discovered him at the Metropolitan Hotel, and without a word of ceremony burst into his apartment. "What do you want?" he enquired with apprehension. They threw him on his face and made frantic explorations of his back. He had taken his bath and the plaster had vanished, but where it had been, mixed up with the impression of the plaster, were the imprints of seventy large diamonds.

The largest library is the Bibliothique National, in Paris, founded by Louis XIV. It contains 1,400,000 volumes, 300,000 pamphlets, 175,000 manuscripts, 300,000 maps and charts, and 150,000 coins and medals. The collection of engravings exceeds 1,300,000, contained in some 10,000 volumes. The portraits number about 100,000. The building which contains these treasures is situated on the Rue Richelieu. Its length is 540 feet, its breadth 130 feet.

The most remarkable whirlpool is the maelstrom, off the northwest coast of Norway and southwest of Moskenæsol, the most southerly of the Lofoden Isles. It was once supposed to be unfathomable, but the depth has been shown not to exceed twenty fathoms. The whirlpool is navigable under ordinary circumstances; but when the wind is northwest it often attains great fury and becomes extremely dangerous. Under

strong gales the maelstrom has been shown by official statistics to run at the rate of twenty-six miles an hour.

Among the most remarkable natural echoes are that of Eagle's Nest, on the banks of Killarney, in Ireland, which repeats a bugle call until it seems to be sounded from a hundred instruments, and that on the banks of the Naha, between Bingen and Coblentz, which repeats a sound seventeen times. The most remarkable artificial echo known is that of the Castle of Simonetta, about two miles from Milan. It is occasioned by the existence of two parallel walls of considerable length. It repeats the report of a pistol sixty times.

BUSINESS CHANGES FOR JULY.

W. H. Cooper, Emerson, Man., Hardware &c., stock sold at 45c. on the dollar to W. Beach. Potts & Co., Wardsville, Tins &c., burned out. D. H. Cunningham, Plattsville, watches, moved to Bothwell. Geo. B. Meadows, Barrie, stoves &c., assigned in trust. —— Roberts, Regina, jewelry, store burglarized. J. & J. Pennington, Winnipeg, tinware, &c., left for parts unknown and stock sold by sheriff. Charles Paille, St. Jean Baptiste, jeweler, moved to St. Johns. N. Germain & Co, Winnipeg, hardware, offering compromise. L. Jacobson, Winnipeg, jewelry, giving up business. L. H. Noel, Montreal, jeweler, called meeting of creditors. R. J. Butler, Winnipeg, jewelry, &c., sheriff in possession.

BUSINESS NOTES.

Counterfeit $10 notes of the Ontario Bank are in circulation in Winnipeg.

The good people of Lindsay have experienced a new sensation; a few days ago many of the large stores and all the principal streets were lighted with gas for the first time.

The Western Assurance Company declares a dividend for the current half year at the rate of twelve per cent. per annum, and the British America one at ten per cent. per annum.

The old Toronto Mechanics' Institute, the year before it is handed over to the Free Library board received in rent $598 in excess of the amount required to pay interest on its mortgage. It would seem, therefore that it was well worth accepting as a gift. Mr. Bain was chosen librarian, and Mr. Davy assistant.

A meeting of the creditors of H. G. Levetus, wholesale jeweler, Montreal, was held last Tuesday, when the statement showed liabilities of about $65,000, with assets of $35,000 nominally. Mr. Levetus made an offer of 17½ cents cash, or 25 cents in 6, 12, and 18 months, but neither proposition was accepted, and the estate will likely be wound up. This man claimed a surplus of $30,000 not many months ago.

We notice that the co-partnership that has existed for some years under the firm of Hagstoz & Thorpe, of Philadelphia, has been dissolved by the withdrawal of Mr Hagstoz, and a new co-partnership has been formed with Mr. C. N. Thorpe, as general partner, Geo. W. Childs, special partner, while Messrs. E. C. Chappatte and H. L. Roberts have been admitted to an interest in the business. We wish the new firm every success.

Attempted Burglary.—A party of burglars made a determined to burglarize the premises of Messrs. E. & A. Gunther, corner of Jordan and Melinda streets, Toronto, last month, as well as their neighbor, Mr. Carter, 12 Jordan street. They entered the premises of the latter by prying away the bars of a window. Gaining the roof they proceeded to enter the adjoining warehouse by sawing open a square hole in the roof. They, however, did not enter, being deterred by fear or some other cogent reason. Several burglar's tools were found on the premises.

The Troy pound, still used in this country for weighing the precious metals, is believed to have been deprived from the Roman weight of 5759.2 grains, the one hundred and twenty-fifth part of the large Alexandrian talent; this weight, like the Troy pound, having been divided by the Romans into 12 ounces. The earliest statute of this kingdom in which the Troy weight is named is the 2 Henry V., statute 2, char. 4, but the Troy weight is universally allowed to have been in general use from the time of King Edward I. The most ancient system of weights in the Kingdom of England was the Moneyer's pound, or the money pound of the Anglo-Saxons, which was continued in use for some centuries after the Conquest, being then known as the "Tower pound," or sometimes the Goldsmith's pound. It contained 12 ounces of 450 grains each, or 5,400 grains, and this weight of silver was a pound sterling. The Tower pound was abolished in 1527 by a statute of Henry VIII., which first established Troy weight as the only legal weight for gold and silver, and from that time to the present our system of coinage has been based on the Troy weight, the Troy pound containing 5,760 grains.—*Nature.*

WORKSHOP NOTES.

To Refine Gold.—If you desire to refine gold from the baser metals, swedge or roll it out very thin, then cut into narrow strips and curl up so as to prevent its lying flatly. Drop the pieces thus prepared iuto a vessel containing good nitric acid, in the proportion of acid, 2 ounces, and pure rain water, ½ ounce. Suffer to remain until thoroughly dissolved, which will be the case in from one-half to one hour. Then pour off the liquid carefully, and you will find the gold in the form of yellow powder, lying at the bottom of the vessel. Wash it with pure water until it ceases to have an acid taste, after which you may melt and cast into any form you choose. Gold treated in this manner may be relied on as perfectly pure.

Essences for Cleanino Watches.—Essences for cleaning watches are rapidly coming into custom. They are to be obtained at any of the material dealers and at all drug stores. The object is immersed and left in them for a few minutes, to permit all adhering matter to dissolve; uot too long, however, since several qualities are apt to leave stains. The piece is to be dried on removal, and finish by passing a fine brush over that has been charged with chalk and subsequently rubbed on a hard crust of bone. This will produce a brilliant surface on either gilding or brass. The following composition, the ingredients of which may be obtained in a drug store, has been highly recommended: 90 weight parts of refined petroleum and 25 parts of sulphuric ether. The object is immersed for several minutes, in fact, they may remain for a longer period without danger, and on removal from the bath, are found to be clean and bright. It must not be forgotten that many of these essences are liable to ignite with the mere proximity of a lighted lamp.

Tests for Diamonds.—Hydrofluoric acid will not affect the diamond, while it quickly corrodes glass, which is the material of most of the imitation gems. The only objection to its use is that it will attack certain stones of minor but real value, like the topaz, which are sometimes passed off as diamonds. Of course, being a dangerous agent to experiment with,it must be employed with great caution. The following directions may be safely followed: Take a leaden vessel, of saucer shape and moderate size, in which place pulverized fluor spar, which cover with enough oil of vitriol to completely moisten the powder. Then put in the stone to be tested, and gently warm the mixture over a gas lamp or any other convenient source of heat. This should be done in a good draught, where the vapors will be drawn up a chimney or dissipated, as they are dangerous to breathe. When the evolution of vapors appears to have ceased, which will occur in from five to fifteen minutes, according to the quantity of material employed, the heat should be withdrawn and the vessel allowed to cool. The stone may now be fished out from the pasty mess and examined. If it shows no sign of being attacked, you may be assured that it is a genuine diamond. A paste stone will be found to be strongly corroded by the acid that has come in contact with it, and if it was a small one it will probably have been entirely dissolved.

Separating Silver.—The following simple method of separating silver out of alloys may be useful. It is described by Herr Gottheim: The silver-holding alloy or metals are dissolved in the least possible quantity of crude nitric acid. The solution is mixed with a strong excess of ammonia and filtered into a high cylinder, provided with a stopper. A bright strip of copper, long enough to project beyond the liquid, is next introduced, which quickly causes separation of pure metallic silver. The reduction is completed in a short time, and the reduced silver washed first with some ammoniacal solution and then with distilled water. The more ammoniacal and concentrated the solution, the more rapid the reduction. The strip of copper should not be too thin, as it is considerably attacked, and any little particles which might separate from a thin sheet would contaminate the silver. The operation is so

this Trade Mark is stamped on all Knives, Forks, Spoons and other flat ware of our manufacture.

The A 1 Goods are Standard Heavy Plate, and XII signifies that in addition the articles have an extra quantity of Silver on all the parts most exposed to wear.

The Meriden Britannia Company have been awarded the highest premiums wherever exhibited, from the WORLD'S FAIR, 1863, to the PRESENT TIME, and the high reputation of our Goods throughout the world has induced other makers to imitate our Trade Marks and name as well as our designs, and as many of our patrons have, through a similarity of names, purchased inferior goods under the impression that they were our manufacture, we are compelled to ask especial attention to our Trade Marks.

THE FACT THAT OUR NAME AND TRADE MARKS ARE BEING SO CLOSELY IMITATED SHOULD BE A SUFFICIENT GUARANTEE TO THE PUBLIC THAT OUR WARES ARE THE BEST IN THE WORLD.

WE RE-PLATE OLD WORK AND MAKE IT EQUAL TO NEW.

simple that it seems preferable to all others for such operations as the preparation of nitrate of silver from old coins, etc. Any accompanying gold remains behind during the treatment of the metal or alloy with nitric acid, chloride of silver, produced by the impurities [HC] in the nitric acid is taken up by the ammoniacal solution like the copper, and is also reduced to the metallic state; and whatever other metal is not left behind, oxidized by the nitric acid, is separated as hydrate (lead bismuth), on treating with ammonia. Any arseniate which may have passed into the ammoniacal solution, is not decomposed by the copper.

SCIENCE AND OTHER NOTES.

A poor Jewish watchmaker, of Kisheney, in Russia, has just completed after two years labour, an ingeuious clock, which at certain hours of the day plays the national anthem, and givos a mimic representation of the coronation coremony. When tho hour arrives two doors fly open, disclosing a model of the Cathedral of the Assumption at Moscow, where the Czars are crowned. Then the gates of the cathedral swing back, and within appears the Metropolitan of Moscow surrounded by dignataries of the church in gorgeous robes. Tho Emperor and Empress entor and are sprinkled with eoly water ; thereupon the Emperor takes a golden crown from the Metropolitan aud places it on his own head, and a second crown upon the head of the Empress, and the doors of the cathodral close. The maker of this ingenious toy will present it to their Imporial Majesties immediately after the coronation, provided, of course, that tho polico are sure it contains no dynamite.

The Volta Prize Competition of 50,000 Francs.—The French Depaitment of Public Works has recently communicated to the President of the Academy of Sciences the conditions of the Volta prize to bo competed for in 1887. After a general explanation of the importance of the Voltaic column, follow the five articles for competition : 1st, the prizo of 50,000 francs, established by resolution dated June 11, 1882, will be given as a reward to the author of a discovery making electricity suitable to be adapted in an economical manner to tho following uses : As source of heat, light, chemical operation, mechanical force, as means for sending despatches, or for the treatment of sickness. 2nd, Scientific men of all nations are admitted to competition. 3rd, competitive documents will be received up to Juue 30, 1887. 4th, a committee, to be nominated by the Secretary of Public Works, will test the discoveries of each competitor, and decide to whom the prize shall be awarded.

International Meridian.—As is well known, tho U. S. Government has proposed a uniform international meridian in a diplomatic circular addressed to the several civilized nations. A very great service would be rendered both to shipping interests and geographical science by the universal adoption of this measure. But it is, unhappily, to bo feared that petty national jealousies will also in this case thwart the proposal. While Germany would undoubtedly sacrifice its ancient, almost obsolete, meridian of Ferro for a more modern sensible one, the case is more doubtful already with France, whether they would patiently resign the meridian of "Paris," and when we come to England the case is still more dubious. London papers already claim that Great Britain, as the first commercial, marine and colonial power, should under *all* circumstances have the exclusive right of giving the deciding vote. This, when practically interpreted, means nothing less than that England retains its Greenwich meridian also for the future, and all other nations adopt it without further cavil.

Earth Magnetism.—The magnetism of the earth is still an unsolved problom. Professors Ayrton and Perry lately published an hypothesis that the earth was loaded with static electricity, which, by reason of the revolution of tho earth, operated like a circulating current and magnetized its core. This hypothesis, however, suffered a sad blow by the mathematical criticism of Professor Rowland, who explained that the charge necessary for the surface would also be strong enough to send a spark from the earth to the moon. Another theory is based upon the presenco of an electric current in the air surrounding the earth. Proceeding from the idea of M. Edlund, that an electric current is nothing else than a current of ether, which flows in the revolution, and that electro-static effects were due to the rarification and condensation of the air, M. Selim Lemstrom sought to produce such an ether current in a mechanical way. If a double tube of paper is set into rotation with a core of soft irou, this will become magnetized, as proven by two fino astatic needles. Upon reversing the rotation, also the magnetic poles will reverse. M. Lemstrom deducos therefrom the relative motion of the ether in the rotating tube to be tho cause of polarity. If tho tube were stationary, aud the core revolve, a similar effect would bo obtained.

For Sale.

In largest town in Western Ontario, a first-class jewelry stock, amounting to about $5,000.00. Special inducements to a good man. Apply to Trader Publishing Co., 13 Adelaide St. East.

The Watchmaker, Jeweller and Silversmith,

A Monthly Illustrated Journal. Published in London.

The Representative Organ of the Watch, Jewellery and Kindred Trades in the United Kingdom.

It is full of original information and thorough practical instruction contributed by the leading writers on the various subjects connected with the above trades. The text is well illustrated by wood-cuts, and two supplements of artistic designs for jewellery, etc. accompany each number.

This important Trade Organ, now in its seventh year of publication is in the hands of every British Watchmaker, Jeweller and Silver smith, and is therefore a most valuable medium for manufacturers requiring publicity in Great Britain.

Our list of permanent contributors includes such names as : J. U. Poole, Richard Whitaker, Henry Ganney, Moritz Grassmann, J Herrmann, E. J. Watherston, W. H. Singer an ample guarantee for the sterling value of the journal. Subscription 5s. per annum.

Editorial.

CANADA'S GREAT FAIR.

The fifth annual exhibition of the Toronto Industrial Exhibition Association, which will be held in this city from the 11th to the 22nd September, promises to eclipse all of its predecessors in size and interest. The manager and directorate have spared no pains to make it a grand success, and we look forward to the fortnight of its continuance as a red letter period in this year's history of Toronto. It is expected that the Marquis of Lorne and H. R. H. the Princess Louise will formally open the exhibition, an event doubly interesting, as it will commemorate their last visit to Toronto. The "Queen City" will be *en fete*, and should the weather prove favorable we shall expect to have an influx of nearly half a million of visitors to see Canada's greatest Fair. Railways, both in the United States and Canada, have arranged special excursions, and the probability is that this year our show will make itself more cosmopolitan than ever before. Canada, as well as Toronto, should feel justly proud of our Industrial Exhibition, for by comparison it is far ahead of anything of a similar kind in Great Britain or Europe, and fully abreast of the best State Exhibitions that our neighbors to the south of us can boast. As representing not only the enterprise of the citizens of Toronto, but the genius and progress of the people of Canada generally, it is well worthy of a visit and of the support of our people at large. The people of Toronto are willing that it should be judged upon its merits alone, and only ask a fair field and no favour.

The grounds and buildings will be open to the public on Tuesday, the 11th September, at 9 o'clock, a.m., and will continue open each day from 9 a.m till 10 o'clock, p.m., both grounds and buildings being lighted by electricity each evening. We understand that all the railways running into the city have agreed upon a uniform rate, the first week at one and one third fare, and the last week at a single fare for the double journey.

The low fares and special attractions should make this a favourable time for buyers to visit this market and make a personal selection from the large and well assorted stocks that our wholesale dealers have been importing to meet the demand of this fall's trade.

THE OUTLOOK.

The harvest for the year has now been pretty well gathered in, and merchants both wholesale and retail are taking the precaution to forecast the probable state of business before proceeding to make their final arrangements for this fall's trade. It is well that it should be so, for as a rule the successful merchant is the one who looks carefully ahead and lays his plans for the future, as the necessities of the times seem to demand. The merchant who goes tearing along under a full head of steam, and takes no heed of breakers ahead in the shape of bad harvests and such like commercial drawbacks, although he may succeed for a time, is almost sure to come to grief in the long run. For these reasons we say our merchants are wise to forecast the future carefully before proceeding to make investments which may either make them or break them before they are finally disposed of.

As everyone of our readers know, the early part of the past season was extremely dispiriting from a commercial standpoint. Talk as we may, the farmers are the backbone of this country, and it depends almost entirely upon the success of our annual harvest whether our country is going to be blessed with good times or suffer from depression. The outlook during the early part of the season was black, for it seemed almost certain that the wet, cold, stormy weather was bound to make this year's harvest a failure, and there was as usual, not wanting those who prophesied ruin and disaster to Canada as a natural consequence. We are glad to know, however, that these anticipations of evil were ill founded, and that the favorable harvest weather has made such an improvement in the prospects as to warrant the conclusions that we are going to have a fair if not a good year after all. Although fall wheat is below the average, spring wheat and other coarse grains are good, while root crops are better than usual. In the Province of Manitoba, wheat is more than an average crop, and the Prairie Province alone, after supplying her home demand, will, it is estimated, have fully 3,500,000 for export. In the Province of Ontario the general crop is somewhat behind that of last year—how much will be seen by the annexed table, compiled by Mr. A. Blue, of the Ontario Bureau of Industry.

	1883.		1882.	
	Acres.	Bush.	Acres.	Bush.
Fall Wheat.....	1089455	16522359	1188520	31255202
Spring Wheat..	587090	10237080	586317	9665999
Barley.....	757622	20613495	848617	24284407
Oats.....	1423529	55724044	1375415	50097997
Rye.....	183438	3577774	189031	3549898
Peas.....	543713	11718339	557157	10043355
Totals.....	4537847	118393091	4744557	129796853

From this it will be seen that the main falling off in this year's crop is in fall wheat, but this local failure in Ontario will be more than made up by the great crop in Manitoba, and as a matter of fact we may safely consider the wheat crop of Canada as fully equal to that of any former year. As a matter of fact, however, it is gratifying to know that Ontario and the older provinces are in a large measure getting independent of the wheat crop which was formerly our sole mainstay. Every year we are having less attention devoted to wheat and more to the raising of cattle and dairy products, and these we are glad to see from the same report are more than usually favorable:

"A return of the dairy butter produce of last year shows that the quantity made was 33,442,123 lbs.; but a large number of farmers were unable to fill the schedule under this head, and it is probable that the quantity given does not represent more than seventy per cent. of the actual production, possibly not so much. There are in the province this year 29 creameries, or 13 more than last year. The produce of 17 of these from the opening of the season to July 31st was 250,908 lbs., of

which 217,855 lbs. sold for $48,146. The number of cheese factories is 628, which is 151 more than the number reported to the Bureau of Industries last year. The produce of 262 factories that have made returns for the same period as the creameries was 10,833,507 lbs., and of this quantity 8,431,372 lbs. was sold, realizing the sum of $903,310. The quantity of cheese on hand at the 262 factories on Aug. 1st was 2,402,135 lbs."

From these figures and the reports which reach us from every quarter we may safely conclude that not only is our harvest much better than had been anticipated, but that taking it altogether it is fully up to the general average. This fact has inspired a feeling of confidence in the country, which was almost lacking a couple of months ago, and we look forward in a general way to a continuance of prosperous times for this country. We think the country is safe, and although care should be exercised in buying, over caution in this respect will be almost as great a mistake as buying rashly. We think the right thing will be to strike the mean between them, and buy boldly and yet carefully.

CHEAP PARCEL POST.

The new parcel post system, of England, is a long stride in the proper direction, and is so far ahead of anything of the kind in the world, that even the extra clever people on this side of the Atlantic would do well to copy it. People in America credit the British people with being slow and behind the spirit of the age, and perhaps they are in some things, but in others it is but fair to confess that they are a long way in the van.

The English postal and telegraph systems have long been the best things of their kind in the world, things for other nations to wonder at and copy, but their latest development of British postal enterprise puts a fitting crown upon a structure that is now as nearly perfect as human ingenuity can make it.

While not possessing any huge monopoly like our express system which sucks the best blood out of every commercial interest it touches, England has heretofore been equally as well served in this particular, and at much less cost, by means of the various railroad parcel deliveries.

Now, however, thanks to the Government, this new parcel post system will put the internal commerce of the country in the shape of small parcels, upon a much cheaper and more convenient footing than it ever enjoyed before. By the new system the postal authorities virtually become express carriers, and carry parcels at a paying rate to themselves, which is about one half of that charged by our express companies in this country.

The Act came into force on the 1st of August last, and the effect already has been almost to revolutionize the old system of carrying goods. As a matter of fact the railways, seeing that very much of their best paying business was likely to slip through their fingers, all at once became liberal to a degree before unheard of with them, and have not only reduced their rates, but have established "Fast Train Parcel" systems of their own, in order to hold a share of the trade. Of how the new system is going to effect the carriage of small parcels in England, our readers may judge from an extract below, taken from the *Ironmonger*. In its last issue it says:

"There is at the present time much activity displayed in the large mercantile establishments, warehouses, wholesale and retail shops, and general manufacturers' places of business in the metropolis, in preparing boxes, baskets, and cases for the transmission of goods by the parcels post. A prevailing pattern is that of a light wicker basket, of the maximum dimensions allowed under the Inland Parcels Post regulations, viz., measuring 3 feet 6 inches in its longest dimension, and being 2 feet 6 inches in girth, that is, around its thickest part. Many wholesale houses have, however, adopted a basket for the conveyance of goods by the post of a uniform length and girth, viz., 3 feet each way; while adapting the baskets to graduated quantities, sizes of 2 feet and 2 feet 6 inches each way are being rapidly prepared for the new postal department."

More than a year ago we advocated in the columns of THE TRADER, the advisability, to say nothing of the necessity, of our own Government looking into this very subject and taking prompt action thereon. The present express system of Canada is an enormous monopoly, and the sooner it is legislated upon and reduced down to a fair living profit, or an opposition started by Government somewhat after the pattern furnished by the new English Parcel Post, the better for the country.

Of course the express companies will squeal, but so does any monopoly when it finds that its power to tax the public as it pleases is gone, and it has to come down to hard pan and compete for business the same as other and less favored people do.

A parcel post system, such as England now enjoys, would be a boon to the business men of Canada, and we trust that the Government will see its way before long to make a forward step in this direction.

A two cent postage rate, and the English parcel post system, would, we think, be about two as popular things as the Government could touch, for they would benefit every citizen of Canada without distinction.

Selected Matter.

THE FIRST HOUR GLASS.

A century after the final overthrow of the Roman Empire, the habit of reckoning by hours and minutes had completely disappeared, from Western Europe. One by one every vestige of art and science disappearing, and, had it not been for the kingdoms of the east, which kept the flame of science just flickering while the west was in darkness, our present system of horology would have fallen in complete abeyance. It was the famous Caliph of Bagdad, Harohn-al-Raschid, who restored the old water clock to Europe. In the year 807 he sent a magnificent clepsydra as a token of friendship to Charlemagne; but it seems that present was looked upon as a thing to be rather admired than copied, for we find no mention of any water clocks of French make until the reign of Philip, contemporary of William the Conquerer. Perhaps the reason of this is that the sand glass (sablier) had been invented in France shortly before the accession of Charlemagne, and that this last contrivance was judged more handy and simple than the other. The first sablier was made by the same man who re-invented the blowing of glass, after the secret had been lost for some centuries. He was a monk of Chartres, named Luitfrand, and the sand glass he made was the exact prototype of all those that have been manufactured since. It consisted of two receptacles of pear-like shape, joined by their slender ends. When the sand had all run out from one into the other, the lower glass was turned uppermost, and kept in that position till empty. Shortly after he had received the gift of Haroun-al-Raschid, Charlemagne caused a monster sablier to

be made, with the horal divisions marked on the outside by thin lines of red paint. This was the first hour glass. It required to be turned over only once in twenty-four hours, and, if it was blown with anything like the care which modern hour glasses are, it must have kept time with as much precision as the best of lever clocks. Indeed, it is not rare to hear people declare, even nowadays, that the hour glass is the best timepiece that was ever invented.—*Jewelers' Circular.*

SIBERIAN GEMS.

Amethysts of great brilliancy, and beryl, are occasionally discovered in several parts of the Oural—some exceedingly fine crystals of a blue, yellow, and rose color; those of the latter kind are rare, and when perfectly transparent, of considerable value. Chrysoberyl is met with in the same locality as the emerald; occasionally very fine crystals are obtained, and cut into beautiful gems. Topaz is also found in one or two localities, sometimes six inches long, perfectly transparent, and sold at a very great price. Pink topaz is rare. Mr. Atkinson says:—"Up to this time, only five small crystals have been met with at one of the gold mines in South Oural, and one of those was presented to me; I deeply regret to say that it is either mislaid or has been lost on my journey."

English mechanics have been employed in the Oural from a very early period, in its mining operations. Several of them, Mr. A. tells us, have become celebrated for their eccentricity, and their names will be handed down through many generations in connection with the works. He relates a tragical history of the fate of one of these adventurous spirits. In the reign of Emperor Paul, a young mechanic, named Major, was engaged by the Russian Government, and sent to Ekaterineburg to superintend a small mechanical establishment. In this town Major spent a long life, and constructed many machines, which, rude as they were, proved of essential value in the mining districts. Peasants were sent to him from the different villages, who had never in their lives seen any mechanical tools except an axe and a saw. When he entered upon his duties he scarcely knew a word of the Russian language, which of course added much to his difficulties. However, as years rolled on, he acquired some knowledge of it. German he also learned by coming in contact with the miners, many of whom were from the Hartz Mountains. He likewise contrived to add a little French to his stock. His pay being liberal, and living cheap, he was enabled to keep a good establishment; and, being kind to the workmen, he gained their esteem and that of the officers who served under him, while his eccentricity amused them all. He had at length established a sort of jargon of his own, most strange and peculiar. In giving his instructions, he would begin in Russ, add a few words of German, then a scrap of French, and finally glide into an English sentence, which he concluded with an impetuous volley of threats in case of disobedience.

When the Emperor Alexander visited the Oural he was greatly pleased with the works Major had established, and, as a token of his satisfaction, presented him with a piece of land containing about twenty English acres, with all the minerals it contained, and gold was known to be deposited there. This imperial act of bounty proved fatal to the unhappy Englishmen, who built for himself a house on his land, and a few years later he began to excavate and wash the gold sand, usually obtaining more than two poods of gold a year, at a very small cost of labor. This was worth about three thousand five hundred pounds sterling. He had gone on this way several years, living at his country house with very few people about him, and often having no domestic except an old woman. At length an usually productive year occurred: the quantity of precious metal he had obtained during the summer was accurately known to the workmen, each day's produce being weighed, entered in a book, and delivered to Major every evening. He deposited it in an iron box which stood in his cabinet, the key of which he carried in his pocket. This year there were more than three poods of gold in the box. The time was approaching when this treasure would be sent to the smelting works at Ekaterineburg, there to be cast into bars, and forwarded to the mint at St. Petersburg, when, one Sunday morning, Major and his old housekeeper being alone in the house, a noise was suddenly heard near the entrance door. The old dame rose to see what was the matter; but scarcely had she left the room when she was seized and thrown down a staircase. Major, hearing the noise, rushed to the door of his cabinet with a candle in his hand, when a blow from an axe fell upon his head, and he never breathed again.

After this, the murderers possessed themselves of the box and the gold, with which they made off, closing the doors after them. It was not till the morning of the third day that this terrible tragedy was known, when one of the officers of the machine works came to consult Major on business of importance. Search being made, the ghastly remains of the murdered man were found, his hand still grasping the candlestick. The old woman was discovered in a state of unconsciousness, though still living.

A strict investigation was made, and suspicion fell upon some of the workmen, who were seized and examined, but it was clearly proved that they were innocent. A strict watch was kept on the movements of certain men who were rather suspicious characters. One of these, a small merchant, was taken and searched. On examination, however, he proved to the satisfaction of the police that he was ninety versts distant on the morning of the murder. He was accordingly set at liberty. Years passed over, and all hopes of penetrating the mystery were given up. It happened, however, that the quantity of gold stolen rom the mines had become so enormous that the government determined to discover how it was effected. An officer of police was dispatched to the neighborhood and after a long and skillful course of manœuvering he contrived to effect the purpose for which he was sent. In the course of his investigations, also, he came upon a clue which led to the discovery of the murderer of poor Major, who was no other than the merchant who had been in the first instance tried and acquitted. This man had long been engaged in gold smuggling, in association with those who stole it from the mines. The murder was clearly proved against him and some accomplices, and they were sentenced to the horrible punishment of "running the gauntlet," and died immediately after. The band of gold stealers was broken up, and the officer of police returned to St. Petersburg to receive a reward for his arduous and really dangerous labors.—*Exchange.*

TEST FOR GOLD.

There is a simple method for the detection of gold in quartz, pyrite, etc., which is not generally described in the mineralogical text books. It is an adaptation of the well known amalgamation process, and serves to detect very minute traces of gold.

Place the finely powdered and roasted mineral in a test tube, add water and a single drop of mercury; close the test tube with the thumb, and shake thoroughly and for some time. Decant the water, add more and decant repeatedly, thus washing the drop of mercury until it is perfectly clean. The drop of mercury contains any gold that may have been present. It is therefore placed in a small porcelain capsule, and heated until the mercury is volatilized, and the residue of gold is left in the bottom of the capsule.

The residue may be tested either by dissolving in aqua regir and obtaining the purple of Cassius with protochloride of tin, or by taking up with a fragment of moist filter paper, and then fusing to a globule on charcoal in the blowpipe flame.

It is being shown that gold is much more universally distributed than was formerly supposed. It has recently been found in Fulton and Saratoga counties, New York, where it occurs in pyrits. It has also been discovered in the gravel of Chester Creek, at Lenni, Delaware county, Pa. In one of the Virginia gold mines wonderful richness is reported, $160,000 worth of pure gold having been taken from a space of three square feet. —*Jewelers' Circular.*

THE SAND BLAST.

Many are the wonderful and useful inventions of the present day, and not the least of them is the common sand blast. Let us suppose that a piece of marble is to be lettered. Cover the stone with a sheet of wax no thicker than a wafer, cut out the letters, figures, or other ornament, leaving the marble exposed. Next pass it under the blast. The wax will remain uninjured, but the sand will have cut the letters, etc., deep into the stone.

If you desire to have raised letters, cut away the surroundings of the letters down to the stone, and by applying the blast, the sand will cut these surroundings away, leaving the wax-protected letters unscathed.

Take a piece of French plate glass, of convenient size, and cover it with fine lace, and expose it to the action of the blast sand. Not a fiber of the lace will be injured, but the glass will be worn away wherever it was unprotected by the lace, and its beautiful and intricate pattern will be found engraven upon it, upon the removal of the lace. Beautiful figures and devices of all kinds may thus be engraven upon glass at a comparatively small expense. Even while the sand is wearing away the hardest material, the workman may hold his hands into it with impunity; his hand, yes, but not his nails, else he would have none in a very short time. Even the protection of steel thimbles will do no good, they will be worn away very quickly, but a wrapping of soft cotton will protect them completely. The sand wears away any hard substances, steel, iron, even diamond, but leaves unharmed soft substances, the human hand, wax, cotton, or any other soft article.—*Jewelers' Circular.*

MUSIC BOXES.

"There is a great demand for music boxes from China," said a Broadway dealer. "The Chinese are passionately fond of them, and at a festival a Chinaman who can afford it carries a music box in each pocket. "What music do they like best?"

"All Chinese music. They will have no other. The sweetest strains from 'Trovatore,' 'Mignon,' and 'Faust' are as 'sweet bells jangled out of tune' to a Chinaman. We have to employ men who can reduce the Chinese music to written notes, and from this as 'copy' the music box is made. We have to make up a different set of tunes for every country. If we should send boxes to France that played 'Nellie Gray,' 'Way Down on the Swanee River,' 'When you and I were Young Maggie,' or 'Sweet By and By,' we should get them back quick enough.

"National airs are the first tunes chosen, then the popular tunes, and then selections from famous operas. Scotch tunes, except 'Auld Lang Syne' and 'Bonnie Doon,' are difficult to render effectively by a music box, and they are rarely used. The great expense in the manufacture of music boxes arises from the necessity of changing the tunes, discarding those that are tiresome and substituting the latest and most popular. But sit down while we talk."

The writer took a seat, and the strains of "Farandale" from "Olivette" floated from beneath the chair.

"Have a cigar?" He turned a cigar stand, and there came out of it the air of the drinking song Girofle-Girofla."

"This is a picture of our Swiss factory."

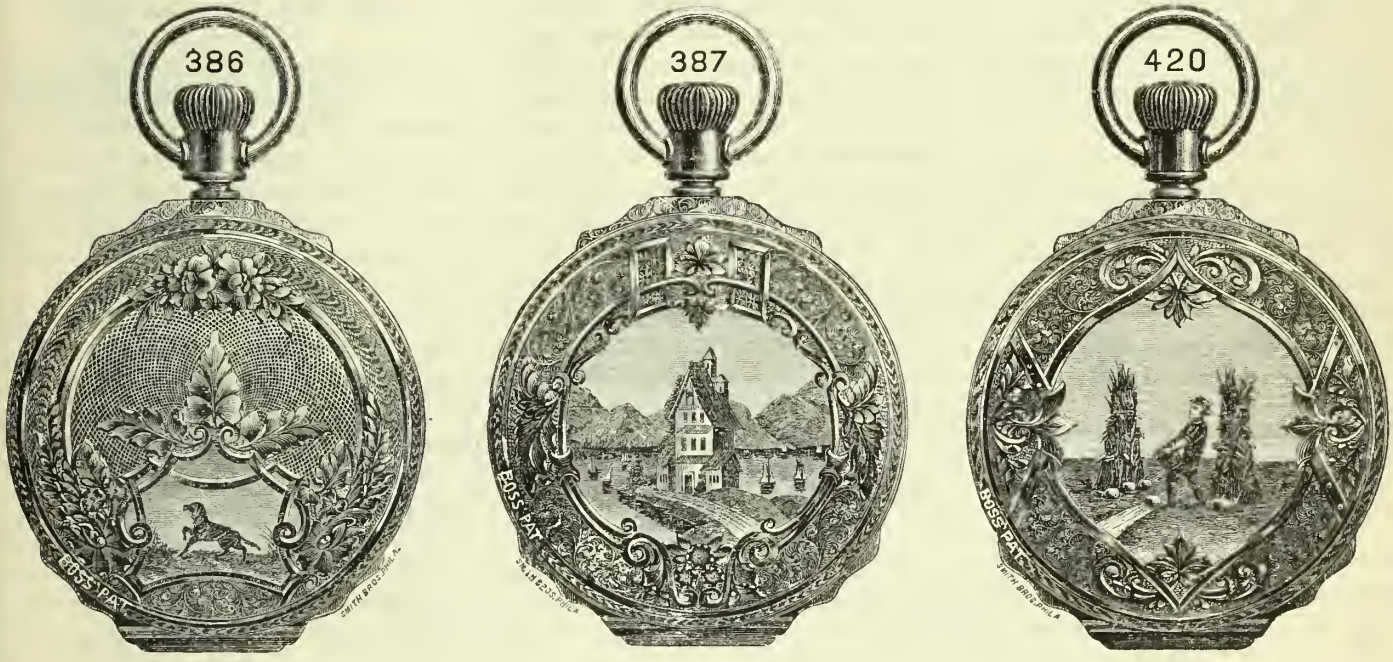
As the album was open there came out of it an air from "Fra Diavolo."

"Will you take a pinch of snuff?"

As the lid was raised there was a whisper of "Should Auld Acquaintance be forgot?"

"We have a customer who has a music box attachment to his front door, and his visitors are always greeted by a tune. A music box can be concealed in a very small compass, and one of the reigning demands is for articles that contain them so as to create pleasant surprises. Dolls, clocks, and books are provided with them. Nearly all of the music boxes are made in Sainte Croix or Geneva in Switzerland.

"The principle of manufacture is simple. The different parts comprise a brass roller, studded with fine points of the hardest steel, a steel comb the teeth of which give the sounds, a spring to give the revolving motion to the cylinder, and fly wheel or fan to regulate the revolving motion. The music has first to be arranged by a thorough artist. The cylinder which comes from the machine shop is then placed in the hands of a woman, who, with the aid of the music and a very ingenious machine, marks the places on the cylinder where the points are to be inserted. Another person drills all the little holes, and another inserts the points. The cylinder is then filled with molten cement, and then placed on the lathe and revolved quickly. The cement adheres to the inside surface, and thus holds the points. A hole is left in the center of the cylinder for the axis. The points are then filed down so as to be of equal length. The comb is tuned by a tuner, who first files the teeth without excessive care, to give them the proper flexibility, and then files them near the base to lower the tones, and near the points to sharpen the tones.



The operation of fastening the cylinder and the comb to the bed plate requires much accuracy, so that the points of the cylinder and the comb will exactly meet. A woman following the music then bends the points on the cylinder

NEW LINE

Jas. Boss' Gold Watch Cases.

THE LOUIS XIV OR BOX JOINT STYLE.

These Cases are engraved in all designs now being used on our regular goods, as well as a special line, particularly adapted to this style of case.

THE BOX JOINTS ARE ALL MADE OF SOLID 14k. GOLD.

The JAS. BOSS GOLD WATCH CASES are unapproached in quality, construction, finish and ornamentation.

THE GOLD USED UPON THEM ASSAYS $14\frac{2}{10}$ KARAT BY U. S. MINT ASSAY.

All of the parts most subject to wear are made of SOLID GOLD. They are not gilded to make them look better than they really are, consequently will not change color in a short time, to the annoyance of the dealer and disgust of his customer.

For Sale by all Canadian Jobbers.

slightly forward in order to secure more strength, but more especially to make the chords drop more simultaneously and cause the runs or roulades to be played evenly.

"Size in music boxes increases both their volumes and richness in tone. A cylinder ten inches long can be made to play six, eight, ten, or twelve airs well, but it will play six or eight airs better and with more sweetness and harmony of sound than it can be made to play a greater number. The reason of this is that more points on the cylinder and more teeth in the comb can be used for each air if there are fewer airs. The space between the teeth decreases with the number of airs. If the cylinder is increased in diameter the airs may be prolonged."

"How long does a music box last?"

"It is like a watch. It will last a lifetime if it is good to begin with and is treated with care. Most owners of music boxes object to using them except for company. The fact is, a music box should be used every day, just as a watch should be wound up every day.—*Exchange.*

THE LUNEBURG SILVERWARE.

To be mentioned as an interesting set of copies of the celebrated Luneburg (Germany) city council silverware, are those executed by two local firms. The fortunes of this treasure are sufficiently known. In the course of a year melted together to one-sixth of its bulk, it was still sufficiently important to constitute the chief attraction for the occasional tourist who came to inspect the sights of the old, reduced, hanseatic city. And it was a picture calculated to forcibly transport the sight-seer back into the old, proud, hanseatic times, as the old bailiff, himself appearing to be an heirloom bequeathed by the past centuries, opened a secret closet in the dark council chamber, in the dark brown wainscotting, and after having removed ponderous iron bars and doors, drew forth from an arched niche the treasure trove one after the other, and handed them to the visitor. And with the glittering luster lights of the old silverware, imagination might have peopled the moldy old room with the ancient venerable forms of the burgomasters and there assistant councilors, who, to the perpetual remembrance of the discharge of their functions, had donated the single pieces of this service.

But, alas! romance is a little honored guest in these, our practical days; in order to liquidate commonwealth debts, the modern fathers of the city listened only with too great an avidity to the sonorous offers made them by foreign antiquaries for their "silver things." And little was wanting to let these masterpieces of ancient silversmithing wander the same road of the reliquies and monstrances of our Rhenish churches in the first half of this century. But, happily, the state interposed at a right time, and without battering, became possessor of the Luneburg treasure, for the respectable sum of nearly a quarter million dollars. It also bound itself when the art treasure was incorporated into the art collection museum, in Berlin, to return a galvanic reproduction of those pieces with which it was possible, to the city of Luneburg. After many trials, these reproductions have most worthily been executed by the firms of D. Vollgold & Sohn, and Sy & Wagner. The pieces are entirely worked in the "deception style."—[*Ext. from German letter.*

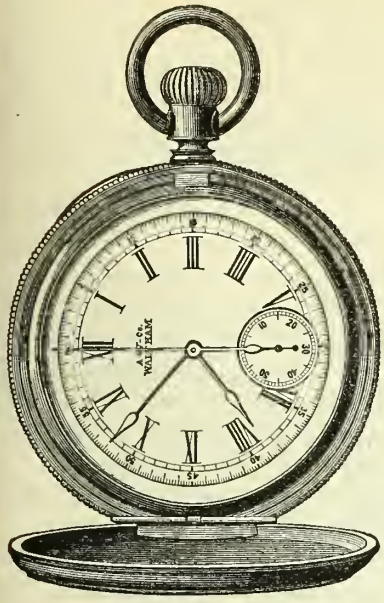
THE SWEATING AND FREEZING OF SHOW WINDOWS.

During the winter season, especially when the gas is burning during the greater part of the day, many a storekeeper will have been at his wits' ends to devise a plan for the disagreeable sweating of the windows; it is the source of much trouble, and many hitherto employed means were useless until now. We believe to be sustained in our assertion that no remedy has been followed with as satisfactory a result as the one specified below. Since the inventor obtained a patent upon the process, it might interest the readers to find out what it is.

The invention consists of a fluid composition that prevents the dampening and sweating of windows. It is composed of 63 per cent. alcohol, glycerine, and a little essential oil (in a few cases, amber dissolved in alcohol, adequate to the conditions of the atmosphere). The proportions used by the inventor, Mr. Corn. Kerby, of Camperwell, are as follows: about ½ pound of glycerine to 4½ liters alcohol, and a little essential oil. The quantity of the glycerine varies according to its quality.

By the composition of the above specified ingredients, the essential oil is dissolved by the alcohol, and the fluid united with the glycerine. It may be done at ordinary temperature, and it is not whatever necessary to expose the mixture to the heat. This is applied to the inside of the window. The pane is either rubbed with a clean linen cloth, or else the fluid mass is applied with a camel's hair brush or "some sich," and the blind appearance of the glass, owing to overheating, is entirely overcome.—*Diamant.*

SCENES IN A JEWELRY STORE.



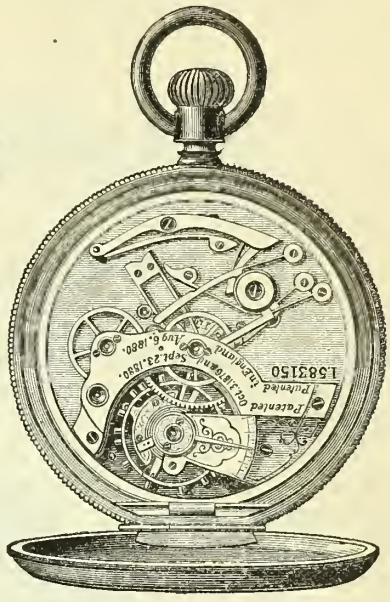
The trials of a hotel clerk are often cited as something beside which the afflictions of Job were but a side-show But the hotel clerk's position is a paradise compared to that of the jeweler's, who combines with the selling of jewelry the repairing of watches, and whose place of business happens to be on a crowded thoroughfare. He is overrun with inquiries as to the correct time by hundreds of persons to whom he is under no obligation whatever, and asked to diagnose the complaints of hundreds of watches whose owners, after extracting a professional opinion gratuitously, and having their watches set to the correct time, take their departure with the remark that they "will get the darned thing fixed when they get home."

Our friend Hastings, an expert watchmaker, is situated in one of these unpleasant locations, and he declares that the amount of gratuitous work he does, if paid for at fair prices, would make his fortune in a year. Having a little leisure the other day, we drop in for a little chat with Hastings, well knowing that we should not interfere with his business, for he can chat to a friend without interrupting his work. Here is an outline of what occurred in the course of half an hour:

Time, 11 A. M.; scene, jewelry store; Hastings at work at his bench, glass screwed in his eye, examining the intricate viscera of a fine chronometer. Enter fussy stranger.

F. S.—"Can you fit me with a watch key? watch run down, lost key, want a new one."

Hastings.—"Certainly, Sir," replies Hastings, unscrewing the glass from his eye, and laying down his work regretfully. Hunts among the keys, fits one



NEW

CHRONOGRAPH

STOP WATCHES

MADE TO

START, STOP AND FLY BACK,

WITH OR WITHOUT SPLIT SECONDS,

MANUFACTURED BY THE

AMERICAN WATCH CO'Y,

WALTHAM, MASS.

By Patented Improvements in Construction, and considerable Diminution of the Parts required, as well as by the application of American Machinery, the AMERICAN WATCH CO has so simplified the manufacture of Chronograph Watches as to greatly reduce their cost. They can now be obtained at prices which make them the MOST DESIRABLE timepieces for Sporting Purposes, AS WELL AS FOR GENERAL USE. Dealers can depend upon these goods giving satisfaction, as they will not require the constant repairs, nor subject the dealer to the annoyance experienced in most of the foreign watches of this class. In case of accidents, Duplicates of Broken Parts can be furnished by return mail. Cased complete in 16 Size Gold Open Face and Hunting Cases. (Open Face made to wind at figure XII.)

ROBBINS & APPLETON, General Agents,

NEW YORK.

to fussy stranger's watch, winds it and sets it to the correct time.

F. S.—"What's the price of this key?"

H.—"Ten Cents."

F. S.—"Ten cents! Holy mother of Moses! I can buy 'em of boys in the street for three cents. This is a swindle!"

H.—"You needn't take it if you don't want it."

F. S.—"Take it! Of course I won't take it! Do you think I'll pay ten cents for a key when I can buy one for three? Not much!"

Exit F. S. with indignation. Hastings resumes his seat, adjusts his glass, and goes to work on his chronometer.

H.—"Now that's what I call a profitable customer. He comes in, interrupts my work, takes my time, gets me to set his watch going, and then mentally damns me for my good nature. But the world is full of his kind. He didn't want to buy a key; he knew he left his at home, but he wanted his watch wound and set; he had it done, and it wasn't in his nature to be grateful for the favour, so he makes up a lie for the purpose of getting a chance to abuse me. He'd rather lie than say thank you. I have lots of such customers; they're profitable, they are; piles of money in them."

[*Enter German, evidently a market gardener.*]

German.—"Did you got some leetle vatches for a lady?"

H.—[*Unscrewing his glass and putting away his work. He exhibits watches in great variety.* "Yes, Sir; I've watches of all kinds. About what priced one do you want?"

G.—"Vell, I vant a nice leetle von for my girl. I'm going to be marrit next veek, and I vant to give de gal a nice leetle vatch. She is a nice gal, und makes pies for de bakery, und I vants to give her a pooty leetle vatch."

H.—"Well, here's a nice one, gold case, back action patent lever escapement, fourteen holes for jewels, compensation balance wheel, independent movement, warranted to run a life-time. I'll sell you that for $65."

G.—"Dat's a pooty vatch, und dat pie gal vould look bully mit it on, but I dont vant to pay more as $50 for a vatch. Dese is hard dimes, und I haf to vork too hart for dat money to pay so much. I gif you $50 vor it."

H.—"I can't afford to sell it for less than $65. What difference does it make to you whether you pay $50 or $65—ain't you going to marry the girl, and won't the watch be yours again in a week?"

G.—"Dot's so, by gracious! I didn't dink of dat. If I gif dat pie gal de vatch un den marry her, den I own de gal und der vatch too, und if I haf to pay taxes on dot vatch, den I sell again. All right. I dake it for $65. Put it in a piece of paper und write de pie gal's name on top of it. Perhaps you'll vant to buy it back pretty quick, dont it?" *Exit German with a grin on his face that makes his mouth look like the opening of navigation.*

Hastings resumes his work, but hardly gets seated when an elderly portly gentleman, who, producing a $10 silver watch, says:

"Good morning, Hastings. Is that chronometer of yours right?"

H.—"Yes, Sir; exactly with the time-ball yesterday."

E. P. G.—"I don't take much stock in that there time-ball. It varies. 'Spose there's a strong wind a blowin' when the ball ought ter drop, and the wind gets under the ball and holds it up, don't it lose time I want to know? Then it's a nuisance anyhow; a crowd of folks git around on the corners, a twistin' their blessed necks out of joint a watchin' for the ball to drop, and a lot of thievin' pickpockets goin' through 'em all the time. I lost a spectacle case that way last week, and got a crick in my neck a twistin' of it for to get a look at that blasted ball a droppin'. I believe that there been more'n $50,000 stolen out the crowds watchin' for that ball by dodratted pickpockets. It's a nuisance, and the Board of Health ought ter abolish it afore people twist their heads off."

H.—"Well, my chronometer has the right time." [*Takes E. P. G.'s watch and pretends to regulate it.*

E. P. G.—"Wall, if that's so, that watch of mine has lost ten seconds in two weeks. You guaranteed it to keep good time, and if you dont regulate it I'll throw it back on your hands." [*Exit E. P. G.*]

H.—[*Resumes work.*] "That old buffer's worth a million dollars, but he's penurious as —— Mephistopheles. His wife and daughters, however, buy a good deal of me, so I try to keep on the right side of him. He came in two months ago and bought that $10 watch, and expects it to keep as exact time as a Bliss Chronometer. He bothers me to death regulating it for him."

[*Enter fast young buck with $300 watch to compare time.*]

F. Y. B.—"Mornin', Hastings. How's your time? All right. Watch only gained seven minutes this week; she's comin' down to biz; don't care so long as she's fast, but don't let her get slow; shall die if she goes slow. She's a bully good watch, and I'm glad I got her. Give her a little turn backward, and I'll try her another week. Bye bye."

H.—[*Having attended to young man, takes his seat and resumes work.*]

[*Enter little girl.*]

L. G.—"Mister Hastings, will yez plaze tell me mother what time it is?"

H.—"Half-past eleven." [*Exit L. G. Returns again in two minutes.*]

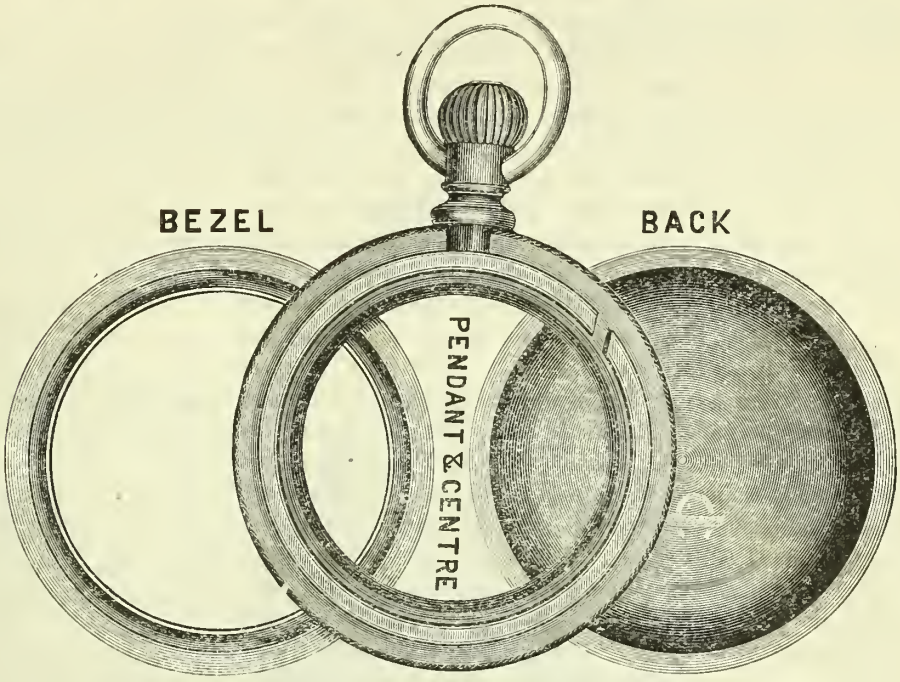
L. G.—"Mister Hastings, will yez plaze tell vhat time it is?"

H.—"I just told you, don't bother me any more."

L. G.—"Well, that wuz for me mother, and this is for Missus Finnigan, sure, who tould me to ax yez, and yez needn't git huffy about a little thing like that. Yez kin kape your old time if yez don't want ter tell it, an' I'll tell Missus Finnigan that yez tould her to go to the divil, and won't she be mad." [*Exit L. G.*]

[*Enter an Irish sailor in an advanced stage of intoxication, accompanied by a wretched-looking woman, also intoxicated.*]

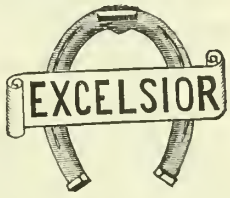
I. S.—"Say, mister, I want to see a ring; a wedding ring, do ye moind; me and the old gal here's goin' ter get spliced, and she sez she must have a ring. Give us a goold one, not too big, and a chape one, too."



W. L. W.—"I'll not have a chape one, sure. I want one as good as Moll McFadden's, or you'll be no husband uv moine, do yez hear that. Sure, I'm not so hard pushed fur a man that I'm goin' to be put off wid a brass ring. Not much I ain't."

I. S.—"Hould your whist, old gal. Sure, hain't I bought lots ov weddin' rings afore, and don't I know vhat I'm doin'. Sure, I'll fix you all right." [*A ring is finally selected, and a compromise made on a dollar and a half.*]

W. L. W.—"That's very good of yez, Jack. It bates Moll McFadden's ring to smidereens. Shure, now, I'll have



THE BEST

THE "EXCELSIOR"

What we Claim in the "Excelsior" Patent Dust-proof Case:

1. The Strongest Case made.
2. The only Case made hard and left hard.
3. No solder or heat to soften the gold or silver.
4. No parts that wear out.
5. No joints to break off.
6. The most perfect-fitting Case made.

TRADE  MARK.

Instructions to open the "Excelsior" Patent Dust-Proof Case.

☞ Press the Crown as in any ordinary case, turn bow to the right to open Bezel, and to the left to open back.

me name put on it. Not my name, but vhat it will be after we're married. Vhat that is, sure I don't know. Vhat the divil is your name, anyway, Jack? Faith, I never saw yez till to-day, un' only heard yez called Jack."

I. S.—"Well, Miss Maginnis, yer name will be Mrs. Jack O'Donnel as soon as the priest has said the words, and that's as good a name as any in the Booklyn Presbytery."

W. L. W.—"True for yez, Jack; but I'm thinkin' I'm not the only woman that wears it. But divil a moind do I moind. I'd marry yez if yez was Brigham Young. I'l be as honest a woman as Moll Maginnis ony way." [*Exit happy couple on their way to the priest.*]

Lunch time having arrived, Hastings put on his coat and steered us for a lunch counter, having lost nearly half a day attending to the wants of a lot of people who gave him "more kicks than hapence," and whose aggregate purchases were summed up in the $1.50 wedding ring bought by the drunken Irish couple and the $65 watch sold to the German gardener.—*Exchange.*

AFRICAN DIAMOND DIGGING.

Fancy, if you can, a pit half a mile long, and say one-third of that space wide. The walls of this chasm are of blue slate, the bottom where the men are at work is a mass of concrete gravel and cement. It is in fact a crater or the mouth of an extinct volcano from the bowels of the earth. In this oval shaded pit, which is now excavated to a depth of perhaps five hundred feet from the margin, from eight to ten thousand people are at work digging and delving into the gravelly *debris* at the bottom. The claims include a space within this pit of diamonds thirty-two feet six inches in surface measurement. These claims are in some cases owned by individuals, and in others by companies who have bought up a group of claims and work them under the direction of overseers. The digging is done by natives, most Kaffirs, who work half naked in the concrete *debris*. To every group of diggers there are usually four white watchmen, who sit and watch when a native discovers a diamond, and over these watchmen an overseer, who makes a record of every "find" made by a digger. A premium of one penny to the pound sterling in value is offered in addition to the regular daily wages for every diamond found. When a native finds a stone he cries out and passes the brilliant to the watcher, and it is handed by him to the overseer, who in turn sends it to the office of the company. Each of these men—the finder, the watchman, and the overseer—receives a price or premium on the discovery made, and this acts as a check upon fraud, each man claiming a premium upon every stone found. From every claim in this pit a double wire cable runs to the level ground at the surface, and upon this ærial railway little cars run up and down. The diamond dirt, when it reaches the surface, is taken out into a field and scattered, and there left exposed to the sun and atmosphere, which pulverizes the cement like dirt. After two or three days' exposure the natives throw water upon the dirt, and then commence the second search for gems. They are picked up by natives almost naked and handed to overseers, who take them to the general office. This dirt is afterward sifted and again sorted, and after a second overhauling is carted away and a new crop laid out for inspection. Notwithstanding the closest vigilance, diamond stealing is carried on very profitably. The half naked Kaffir sometimes succeeds in placing his naked foot upon a diamond and works it up between his toes and so carries it off; or he will stoop down, pick up a precious stone and put it into his mouth; or, pretending to scratch his ankle, slip a gem into his fingers and thence into his ear. The most common mode of diamond stealing is to rub small sized stones into the dense mass of wool which crowns the head of the native African. Some blacks have been caught with as much as $6,000 worth of diamonds in their hair. It is a common expression among the watchers that "we can always tell when a stone has been discovered—the African always trembles.' *Jewelers' Circular.*

BUSINESS CHANGES FOR AUGUST.

Wright & Wright, Hardware and Tins, Brandon, Man., assigned in trust and compromised at 50 cents on $.—J. B. Carr, Jeweler, Winnipeg, selling out by auction.—H. C. Smith, Jeweler, London, absconded.—J. H. Hughes, Hardware, Schomberg, burned out.—Levetus Morris & Co., Jewelers, Toronto, sold out by the sheriff.—Henry Grant, Jeweler, Montreal, has admitted his son, S. S. Grant, as a partner, style now, H. Grant & Son.—Wm. Doran, Jeweler, Emerson, Man., sold out.—W. S. McGregor, Hardware, Walkerton, sold out to S Bricker & Co.—Egger & Co., dissolved, John Egger continuing and admitting H. O. Sullivan, under the same name.—Meaford, Ont.: James Clelland, Hardware, and R. Wood, Jeweler, burned out.—Alex. McGowan, Hardware, Shelbourne, moved to Orangeville.—E. Needham, Jeweler, Shelbourne, burned out.—A. V. Van Norman & Bro., Jewelers, Winnipeg, selling out by auction.—Chilton & Campbell, Jewelers, Ottawa, dissolved, J. P. Clinton continues in his own name.—N. Germain & Co., Hardware, Winnipeg, sold by assignee at 55 cents on the $.—Williams & Hill, Hardware and Tins, Winnipeg, assigned in trust.—H. T. Marsh, Hardware, London, sold out his retail hardware business and continues in wholesale saddlery and carriage trimmings.—Hammond & McKeever, Tins and Crockery, Winnipeg, assigned in trust.

BUSINESS NOTES.

Mr. A. C. Anderson, jeweler, of Hamilton, called on us the other day, and looks splendid after his English trip. A. C. says prospects are good.

The stock-in-trade of H. P. Cooke, of Gravenhurst, valued at $6,637, was sold to Messrs. Crompton & Ryan, of Barrie, Ont., at 73 cents on the dollar. The stock consisted of dry goods, groceries, hardware, etc.

We are glad to see the Toronto jewelry buyers, Messrs. John Segsworth, H. Smith, and W. F. Carrier safely back again at their old quarters. They all look better for their outing, and we trust may be able to push trade this fall all the better for it.

When the Canadian Pacific Railway Company took over from Government the line from Prince Arthur's Landing to Winnipeg, they named their station at the former place, "Port Arthur." The name commended itself to the townspeople, who held a meeting recently, and resolved to call the town Port Arthur.

The foundry business of Mr. Wm. Hamilton, Peterboro', is to be carried on by a limited liability company, known as the Wm. Hamilton Mfg. Company. Capital, $200,000. The letters patent have issued to George A. Cox, Wm. Hamilton, Geo. Munro, Andrew Macfarlane, and Richard Hall, all of Peterboro'.

Infringing Registration.—Messrs. Greenshields & Co., acting for Thomas Allan, jeweler, of St. James street, have entered an action against Mr. Cochenthaler for $5,000 damages for making and selling a species of jewelry which the plaintiff has registered at Ottawa. The distinctive feature of the jewelry in question is that it consists of curved snowshoes with the tuque and thongs.

For the shortest business run on record the palm must be awarded to J. M. Provost, a storekeeper of Hochelaga, Que. He opened about the 7th May on $100 borrowed capital, bought about $500 worth of millinery goods, on the sale of which he has lived, paying not one cent to any of his creditors. The trustee to his estate now advertises remaining assets of $200 for sale.

FACTORIES: WALLINGFORD, CONN., U.S. AND MONTREAL, CANADA.

Mowat Bros., general store men, of QuAppelle and Regina, are said to be asking an extension of 2, 4, 6, and 8 months. Their statement shows liabilities of $25,000, and assets $47,000. Doubt is expressed as to their being able to effect this arrangement with creditors, as there are several suits now proceeding against them.

Mr. W. K. McNaught, of the firm of Zimmerman, McNaught, & Lowe, who has been absent in England for the past few months with the Canadian Lacrosse Team, arrived in Toronto last week. He speaks highly of the reception of the Team everywhere, and thinks they accomplished much for Canada as amateur emigration agents. Mr. McNaught says he feels ten years younger as the result of his trip.

The storehouse and two of the mills of the Acadia Powder Company near Halifax were blown up on Friday last, one man being killed and two wounded. In the storehouse was 200 pounds gunpowder. Neither of the two mills destroyed contained much powder, that which caused the explosion being about the floor and clinging to the wooden walls. Had the drying rooms of the works, a short distance away, gone up, three tons of powder would have exploded.

Immigration into Canada is not slow this year, as may be seen by comparing this year's figures with those of last. The aggregate number at 31st July last, reached 72,281, as compared with 59,939 to same date last year. The total arrivals numbered 121,019 as against 114,078 in seven months of 1882. But of these 48,838 persons were passengers through Canada to the United States, a smaller proportion than in the previous year.

Funny.—Deubers and Ladds, both watch case makers, are at it hammer and tongs, and if the public can believe the bulletins each issues weekly about the other, both of them are precious scoundrels, who should be in jail for deceiving an innocent and unsuspecting public.

The probability is that although much of what is alleged by each against the other is untrue, where there is so much smoke there is sure to be some fire smouldering beneath the surface, and if these exposures do no good in making either of them raise the standard of their goods, it may at least have the effect of putting the public on their guard to see that they get goods from reliable houses.

With all their wordy fury, however, we should not be surprised to see these belligerents, when they meet, instead of coming to blows, as they should do, quietly shake and adjourn to some bar contiguous to Maiden Lane and "smile" at each other.

Undervaluation of Goods.—Says a Toronto exchange:—"There has been a flutter amongst the wholesale jewelry trade of the city since the establishment at No. 15 Toronto street of a branch of the firm of Stewart, Dawson & Co., of No. 2 Rancplagh Place, Liverpool. Joseph Bland is the agent here of the Liverpool firm. It has been rumored for some time that the local dealers were being considerably undersold by the new firm, and enquiries began to be set on foot as to how Mr. Bland managed it. As a result of these rumors the custom authorities here have made two seizures of English and Swiss watches and jewelry consigned to Mr. Bland from Liverpool for undervaluation. The first was made on April 9th last, when a package of jewelry invoiced at $571 was seized. Assistant Appraiser Miller valued the goods at $850. On June 30th last, another package invoiced at $633, which the appraiser valued at $950, was seized. Accordingly, an investigation is now in progress at the custom house, which will, it is understood, last a couple of days longer, when the evidence will be forwarded to Ottawa. Several leading wholesale dealers and experts have given testimony. Mr. Booth is represented at the investigation by Mr. Walter Barwick, and Hon. James Patton, collector of the port, is presiding over it." We have since been informed that the custom authorities have decided to add 25 per cent. to the face value of Messrs. Stewart, Dawson & Co's invoice, and make them pay duty on this amount.

How Others Look At It.—The Montreal correspondent of the Toronto *Mail*, referring to the recent jewelry seizures, says:—"The extensive seizures of jewelry alleged to be smuggled in here from the United States and sold by agents to the two establishments owned by Messrs. Eaves is causing a good deal of interest, not only in that department, but in hardware, fancy goods, and other kinds of commerce, in which it is alleged by the Custom officials a vast deal of smuggling has been carried on for some time past. An extensive fancy goods merchant assured your correspondent to-day that those merchants doing a legitimate wholesale importing trade in the city have to compete against agents of American manufactories in Boston and New York, whose travellers surreptitiously brought in goods *via* St. Johns, N. B., and Halifax, as well as Montreal, without paying the duty, or perhaps no more than a small proportion of the duty, to the city Customs authorities. These same importers are charged with having the effrontery to open the goods out in private rooms in hotels here where they offer them at such a price as undersells the importer who not only pays the legitimate revenue, but also an annual tax to the city government for doing business. This kind of illigitimate trade has driven a great many honest merchants out of business here in jewelry, fancy goods, and other departments. It is stated on good authority that disclosures are on the *tapis* regarding how large profits have been made in hardware on which the importers got a larger rebate from the duty than they were entitled to. The Government has been investigating matters, and is said to be in full possession of the *modus operandi* by which these swindles have been successfully perpetrated. Developments of a startling kind are expected shortly."

Why it is.—We have often been asked how it was that small "wholesale dealers," as they grandiloquently term themselves, boasted that they were able to, and in many cases did undersell the regular wholesale houses in the jewelry trade. We have pointed out on more than one occasion that these small dealers do not know any more about the business than their larger competitors, their money is worth no more and consequently they can buy goods no cheaper, and that as a consequence the only way in which they can honestly undersell them is by selling their goods at cost, a thing that no one would ever give them credit for doing. That they often sell at honest dealers' cost, there can be no question, and the only possible explanation is that they either don't intend to pay for their goods or else they smuggle them into Canada. The latter is probably the correct solution of the query. As most of our readers are aware, the Customs' authorities have become more vigilant of late and several of these gentlemen have been brought to book. Amongst others, two firms in Montreal have got into the toils of the law, and the *Montreal Gazette*, in speaking of the affair, remarks, "It was stated a few days ago that the case against the smuggling jewelers would probably be settled on payment of a fine. This has been the case, the amount being $7,000 from W. Eaves, and $3,500 from E. & A. Eaves. The Customs officers received their portion of the fine on Saturday, the Government no doubt finding prompt agents and informers' payment a successful means of preventing smuggling, of which there will probably be very much less for some time to come, those in that line of business having been well scared."

This is a pretty severe lesson, and it is hoped that the parties may profit by it to their own good and that of the rest of the trade. They will look at the old adage, "Honesty is the best policy," in a different light from what they formerly did.

WORKSHOP NOTES.

Hardening Drills.—Drills for goldsmith's use are best hardened in oil or sealing-wax, when strongly heated red-hot.

Silver Solder.—Melt 4¾ parts fine silver, ¼ part copper, and 2½ parts brass under powdered charcoal.

Bending Glass Tubes.—Fill the tube with finely sifted sand, close both ends, and heat it over the flame of a Bunsen burner. It may thus easily be bent, without losing its roundness at the elbow.

—Turquoises which have become green, can in no manner be restored again to their original color. Books and periodicals sometimes contain recipes, such as boiling in wine, milk, etc., but it is all to no purpose.

Verdigris.—Copper, or its alloys, may be cleared of its oxydized spots by the application of spirits of sal ammoniac, wiping with silk paper. If the offensive places do not become cleansed at once, a second application will surely effect it.

Silver Wash.—To quickly silver wash articles of copper or brass, mix 3 parts of chloride of silver, with 20 of cream of tartar, in very fine powder, and 15 of pulverized table salt. Add sufficient water, and bray the mixture until it becomes a paste, which rub with a piece of blotting.

To Clean Rusted Steel.—The *Chemiker Ztg.* says that rusted steel can be perfectly cleaned by hard brushing with 30 gr. cyanide of potash, 30 gr. castile soap, 60 gr. pulverized

MARK.

OBSERVE

this Trade Mark is stamped on all Knives, Forks, Spoons and other flat ware of our manufacture.

The A 1 Goods are Standard Heavy Plate, and XII signifies that in addition the articles have an extra quantity of Silver on all the parts most exposed to wear.

The Meriden Britannia Company have been awarded the highest premiums wherever exhibited, from the WORLD'S FAIR, 1863, to the PRESENT TIME, and the high reputation of our Goods throughout the world has induced other makers to imitate our Trade Marks and name as well as our designs, and as many of our patrons have, through a similarity of names, purchased inferior goods under the impression that they were our manufacture, we are compelled to ask especial attention to our Trade Marks.

THE FACT THAT OUR NAME AND TRADE MARKS ARE BEING SO CLOSELY IMITATED SHOULD BE A SUFFICIENT GUARANTEE TO THE PUBLIC THAT OUR WARES ARE THE BEST IN THE WORLD.

WE RE-PLATE OLD WORK AND MAKE IT EQUAL TO NEW.

and washed chalk, and water sufficient to make a dough; care, however, should be used in its application.

CLEANING SILVER.—The simplest and quickest agent for cleaning silverware is the hyposulphate of soda. It operates rapidly, is cheap, and has not yet been proposed for this purpose. A rag or brush, moistened with a saturated solution of this salt, quickly cleans heavily oxydized silver surfaces in a few minutes.

TRANSPARENT SIGNS.—To heighten the effect of the sign of a firm, a sign maker in Hamburg places colored or white glass splinters between two glass plates covered from within with a covered coating, except the necessary letters and figures, and the penetrating rays of light shine through the splinters and break into all the prismatic hues.

ARGUZOID.—This is the name of a new alloy coming from Glasgow. It is said to be far whiter than nickel plating, and can hardly be distinguished by the color from silver. Although 50 per cent. dearer than brass, articles made of it are cheaper than those plated or galvanized with nickel. The resistance to pressure of this alloy ranks immediately after silver, resisting 16 tons, while brass bears 10, and phosphor bronze about 14 tons. It stands equal to brass in ductility. The virtues of its resistance to temperature are at present under trial.

GALVANIC GILDING.—Phosphate of soda, 60 parts; bi-sulphate of soda, 10, cyanide of potash, 1; chloride of gold, 2.5; distilled water 1,000. The water must be divided into three parts: 1st part, 700 parts, in which the phosphate of soda is dissolved; 2nd part. 150 parts, for dissolving the chloride of gold; 3rd part, 150 parts, for dissolving the bi-sulphate of soda and cyanide of potash. The first two solutions are little by little mixed together, and the last is then added. For this gilding, to be heated to 40 to 55° R., use a platinum anode, and add fresh portions of the salts of gold when the solution is exhausted.

SCIENCE NOTES.

DURING the first four days that the Parcel Post was in operation nearly thirty thousand parcels were delivered in London in number collected in the metropolis during the same period amounting to about seventy thousand. The deliveries on the second day showed an increase of six thousand packages on the first day. Great satisfaction has been expressed as to the general working of the new service. The average weight of the packages forwarded for transmission has been about three pounds.

IT is a wonderful fact that shipping, as old as civilization and once the great carrier of the world's commerce, has been far outstripped in its capitalized value by the railroad, an institution but little more than fifty years old. The value of British shipping is $1,000,000,000; value of British railroads, $3,700,000,000; value of American railways, $6,300,000,000. Great Britain herself, the queen of marine commerce, finds her railroad investment to treble that in shipping, while the American railroad plant nearly doubles in value that of the Mother Country.

IVORY is growing dearer by reason its of scarcity; the stock in the market is very low. Sheffield ivory has advanced from £1 to £4 per hundred weight, and a rise in the price of ivory handles is in contemplation. The cholera epidemic in Egypt has greatly interfered with the sale of African ivory, and it is very probable there will be no supply from Egypt this year. At the ivory sales in London, last week in July, 120 tons were offered, and all with the exception of about five tons, was bought at considerably advanced prices.

A BRITISH Treasury minute as to the reduction of charges for telegrams states that the sixpenny telegram is to be introduced on October 1, 1884. The necessary preliminary expenses of the measure are expected to amount to half a million sterling, of which 200,000 or $1,000,000 will be expended in the current financial year. The receipts for the first year of the experiment, 1884-5, are estimated to fall short of the revenue by about £200,000. The supplementary estimate issued on the 4th inst., shows that a further sum of £339,456 is required by the British Post Office during the present financial year for working the parcels post.

SITUATION VACANT.

WATCHMAKER—young man competent to do repairing for the trade, and assist in jewelry department. Apply with references as to character and ability to

SMITH & FUDGER,
LATE R. WILKES.
TORONTO.

For Sale.

In largest town in Western Ontario, a first-class jewelry stock, amounting to about $5,000.00. Special inducements to a good man. Apply to TRADER PUBLISHING CO., 13 Adelaide St. East.

The Watchmaker Jeweller and Silversmith

A Monthly Illustrated Journal. Published in London.

The Representative Organ of the Watch, Jewellery and Kindred Trades in the United Kingdom.

It is full of original information and thorough practical instruction contributed by the leading writers on the various subjects connected with the above trades. The text is well illustrated by wood-cuts, and two supplements of artistic designs for jewellery, etc. accompany each number.

This important Trade Organ, now in its seventh year of publication is in the hands of every British Watchmaker, Jeweller and Silversmith, and is therefore a most valuable medium for manufacturers requiring publicity in Great Britain.

Our list of permanent contributors includes such names as: J. U. Poole, Richard Whitaker, Henry Ganney, Moritz Grassmann, J. Ferrmann, E. J. Watherston, W. H. Singer. An ample guarantee for the sterling value of the Journal. Subscription 5s. per annum.

Published by A. FISCHER, 11 Saint Bride Street, London, E. C., England.

THE WATCHMAKER
And Metal Worker
Is the official Journal of the
Watchmakers and Jewellers
of the North west,
CONTAINING 56 PAGES OF
Illustrations and Reading Matter.

Whose columns are replete with choice articles upon Horology, Watch-making and repairing, written for this Journal by practical and scientific men; also a large amount of general information of vital importance to the trade; also continued articles, or lessons in letter engraving, written by a celebrated engraver of this city. Subscription price, $1.50 per year. Single copy, 15 cents.

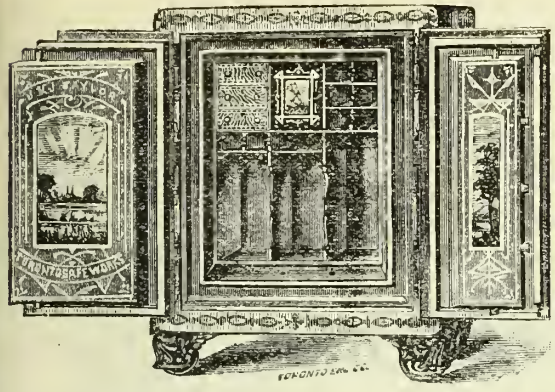
THE LARGEST
Clock House
IN CANADA.



I hope the Trade are convinced by this time that the above clock house has got the best assortment and better value than any other house in the Dominion.

I thank my many friends for their kind patronage in the past, and solicit a continuance of the same.

I have just returned from the eastern States and have imported a large stock of Walnut and Nickel Clocks, which I will sell at prices that defy competition. Also receiving daily Jewelry of all kinds. Roll Plate Chains a specialty. Large stock of Swiss Watches in Gold, Silver and Nickel Cases, key and stem winders. The best value in Whitby Jet Goods, such as Bracelets, Necklets, Sets Earrings, etc., which I will cut low prices to the Trade only.

Orders by mail promptly attended to.

SAMUEL STERN,
Wholesale Agent for the Seth Thomas, Welsh, Ansonia and Ingram Clock Co.'s
31 Wellington, 40 Front St. E., Toronto.

J. & J. TAYLOR,

TORONTO SAFE WORKS.

Patentees and sole manufacturers of Taylor's patent Fire-proof Safes with

Non-Conducting Steel Flange Doors.

ALSO MANUFACTURERS OF

Burglar Proof Safes, Vaults, Vault Doors, Bank Locks, Combination Locks, Prison Locks and all Kinds of Fire & Burglar-Proof Securities.

20 YEARS ESTABLISHED.

The Oldest and Most Reliable Safe Manufacturing Firm in the Dominion

A. C. ANDERSON & CO.

IMPORTANT NOTICE.

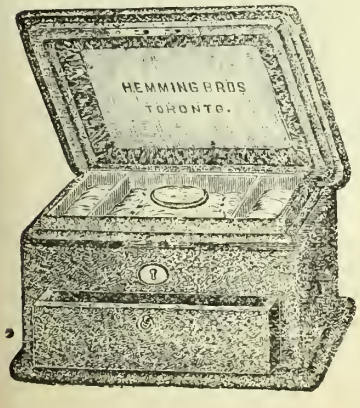
Our MR. ANDERSON has just returned from the European Markets, where, on account of the very depressed state of trade in England and Switzerland he has been able to secure for **CASH** some very special bargains in the following goods :—

COLORED GOLD SETS, LACE PINS, DROPS—entirely new styles, GOLD LOCKETS with and without Settings, extra fine line GEM RINGS, DIAMOND RINGS, special cheap lines BLACK AND RED GARNET GOODS, large variety new styles SILVER GOODS, Sets, Bangles, Necklets, Lockets, Alberts, Name Brooches, Drops and Thimbles. As Silver Goods are worn more than ever this season, we have selected some extra TASTY GOODS.

SWISS WATCHES—Gold and Silver, large assortment IMITATION AMERICAN MOVEMENTS—equal in finish to genuine.

A. C. ANDERSON & CO., - - HAMILTON, ONT.

Zimmerman, McNaught & Lowe



HAVE A COMPLETE STOCK OF

Boss' Patent Stiffened Gold Cases.

THE BEST COLD-STIFFENED CASE MANUFACTURED. BOTH IN KEY & STEM-WINDERS.

W. G. A. HEMMING. H. K. S. HEMMING.

TORONTO CASE COMPANY.

HEMMING BROS.,

MANUFACTURERS OF

PLUSH, VELVET,

SATIN & MOROCCO CASES & TRAYS

Of every description for Jewelry, Silverware, &c.,

52 ADELAIDE STREET EAST,

(FEW DOORS EAST OF POST OFFICE,)

TORONTO.

ZIMMERMAN, McNAUGHT & LOWE,

WHOLESALE AND MANUFACTURING JEWELER ,

16 Wellington Street East, - Toronto, Ont.

Having been appointed Sole Wholesale Agents in Canada for J. F. FRADLEY & CO., we have now in stock a full line of their Silver, Gold Filled and Solid Gold Headed Canes. Orders by mail will receive prompt attention.

ZIMMERMAN, McNAUGHT & LOWE.

GEO. E. COOPER

ORNAMENTAL & GENERAL

ENGRAVER,

Editorial.

IMPORTANT TO IMPORTERS.

The customs department of Canada have recently seen fit to put in force Sec. 81 of the Customs Act of last session in regard to the certifying of invoices. This section reads as follows :

"No entry shall be deemed perfect "unless a sufficient invoice of the "goods to be entered *duly certified in* "*writing thereon as correct* by the "person, firm, or corporation from "whom the said goods were pur- "chased has been produced to the "collector and duly attested as re- "quired by this Act."

In other words, unless the foreign exporter certifies over his own signature at the bottom of each invoice as to the correctness of the goods shipped by him, his customer, the Canadian Importer, will find it impossible to get them out of bond and into his warehouse. Although this may seem a very irritating regulation to importers, it is simplicity itself compared with the American system, which not only requires verification as above but the costly addition of Consul's certificates.

We have taken the trouble to interview the customs authorities in reference to this regulation, and they assure us that all that is necessary to carry it out is simply for the shipper to write on the bottom of *every* invoice the words "CERTIFIED CORRECT," and sign their name immediately below it.

It would be well if exporters would make a note of this ; it will save their customers a great deal of delay and annoyance in getting goods through the customs, as we understand that in future no invoices will be accepted for this purpose unless vouched for as above.

THE GREAT FAIR.

The fifth exhibition of the Toronto Industrial Exhibition Association, has been more than ordinarily satisfactory, and the management are to be congratulated upon the great success it has achieved. We are glad to know that the receipts were nearly five thousand dollars more than last year, which fact will enable the Directors to carry out in a satisfactory manner many needed improvements.

The weather during the two weeks of the continuance of the Fair was all that could be desired, and as a consequence the city was filled to overflowing. Indeed, outside of Montreal, we doubt whether any other Canadian city could have afforded accommodation to such a swarm of sight seekers ; as it was, Toronto's hotels were taxed to their utmost capacity. As shewing the character of the Exhibition, which is becoming more cosmopolitan every year, we may say that not only did the outlying provinces of the Dominion furnish their quota of visitors, but several thousand citizens of the United States thought it worth their while to come over and inspect it.

Of the Exhibition itself we have scarcely space to speak in detail, but in our opinion it certainly surpassed anything of the kind ever held in Canada.

As shewing the progress the Dominion is making in manufactured products, it was well worth a visit, and we have no doubt every true Canadian must have felt a pride in knowing that in the line of goods thus shewn Canada is fully abreast of any country in the world. In horses, cattle and other live stock, the entries were unusually numerous and the exhibit very fine. Taking it together it was a grand show and well deserving of the liberal patronage it received from all classes of the community. The citizens of Toronto should feel proud of its record, and do all they possibly can to help the management in making it even a greater success in future.

THE NEW WATCH DEAL.

The new venture of the "Globe Printing Company" in giving away cheap nickel stem winding watches with each copy of their paper to new subscribers, is worthy of more than a passing mention, inasmuch as it has excited no small amount of banter from others in the same line of business, and provoked a feeling of hostility towards it amongst watchdealers, many of whom have hitherto been numbered amongst its warmest friends. Of course, while *The Globe* has a perfect right to do business in any fashion it chooses, there are certain methods which are so far out of the common rut, as to make them peculiar, to say the very least. The ostensible giving away of a fine stem winding watch with every copy of their paper, at the first blush, seems to be more than liberal, in fact it savors more of the philanthropic than the hard hearted business policy of this utilitarian age. On closer examination however, we find in the words of the poet, "things are not what they seem," and instead of being conceived by a liberal heart bent on sacrificing its wealth in the attempt to provide the great unwashed at once with reliable time pieces and moral reading matter, it is really an ordinary outgrowth of the business sharpness of the present age, the only difference being that the sublimity of its cheek is so paralysing as almost to make the sceptic feel ashamed of having for a single moment doubted the good intentions of so honorable and philanthropic a company. The fact of the matter is, however, and to put it in plain English, the whole thing is an imposition of the most transparent kind, and people might as well expect *The Globe* Printing Company to sell them dollars for fifty cents as to furnish the paper for $3.50, and throw a good timekeeper into the bargain. Boiled down, the transaction would stand something like this : *Weekly Globe* for one year, $1.50 ; one nickel stem winding watch, $2.00—Total $3.50. In other words the subscriber pays regular cash price in advance for his paper, and $2.00 in excess, for which $2.00 he gets a watch that will be sure to go when he carries it and worth probably the money paid for it as a toy to amuse the baby, who can use it for a saw mill or anything else that its childish fancy may suggest. Practical time-keeping qualities, it has none, and for a man's own use, except as

ballast for his watch chain, is entirely worthless. So much for the true inwardness of *The Globe's* great offer.

As far as the watchmaking trade is concerned we think they have no great cause for alarm in this new departure of *The Globe* people. We don't think it is going to hurt their trade much, if any, while the crusade lasts, and we are strongly of the opinion that it will do the trade good in the long run. It seems to us that *The Globe* people are doing a kind of pioneer work in educating the people up to the necessity of a time keeper of some kind, and any person who has worn one of their patent watches for a few months and had a fair taste of its quality will very soon become a good customer to some regular dealer for a real watch that will not only go when carried but keep reliable time.

If it accomplishes this, and this is about the size of what it will accomplish, we think *The Globe* will not have prosecuted its watch crusade in vain, and in educating the people as to the necessity of having a reliable time keeper it will have its reward.

In conclusion, we may say that we have no sympathy with those people who have attempted to belittle this great social reformation of "The Globe Printing Company." Virtue is its own reward, and bearing this in mind we would advise them to continue on in their elevating task—their reward is sure.

FREE TRADE.

The sentiments uttered by the Hon. Alex. Mackenzie in his recent speech before the Greenock Board of Trade, Scotland, have evoked a considerable amount of discussion in this country. Of course the party press each criticizes it from their own standpoint, and it is either good or bad according to the politics of the paper critizing it. Apart altogether from politics, there is much in Mr. Mackenzie's speech that is calculated to do good to Canada, and raise it in the estimation of those who are at present or may in the near future be looking across the sea for a favourable spot in which to locate. To all such, it contains many truths that will go far in making them view Canada in a more favourable light than they have probably heretofore done, and we shall look for good to result from it in this direction.

We think, however, it was unfortunate that Mr. Mackenzie should have touched upon the question of free trade as against protection at all, seeing that his audience, however loyal they may have been to Great Britain, could after all only view this question, which is really none of their business, in the sight of their own interests. Their interest is, as a general thing, opposed to the progress of Canadian manufactures, and it is no wonder that the free trade sentiments uttered by our ex-premier should have been received by them as marks of warm approval. If Mr. Mackenzie's speech is to do any good for Canada at all it must be because it is instrumental in influencing emigrants to come to this country in preference to going elsewhere. If it does not have any effect in this way, it will have been simply as "a sounding brass or tinkling symbol," pleasant perhaps, but useless. If it should have the effect, however, which we trust it will, of inducing Scotchmen to come to Canada, we are strongly of the opinion that if there are any manufacturers amongst them that they will change their trade creed before they are here many years. Trade is selfish, and what is sound doctrine in England, may be rank heresy in some other part of the world. Thus while Britain advocates free trade, it is simply because that system is best adopted to further her own interests. The country is one huge workshop, and her facilities for manufacture are so great that she can produce many lines of goods cheaper than any other nation in the world. With Canada it is the reverse ; free trade to us means simply that we may close the bulk of our manufactories and become mere hewers of wood and drawers of water to Great Britain, the United States, and any other country that is more favourably situated for manufacturing than we are. We do not think our people will care to do this, and although free trade such as Great Britain enjoys is entirely out of the question with us, even the revenue tariff of anti-protection days is looked upon by our manufacturers and the bulk of our people, as being unsuited to the requirements of a country so peculiarly situated as ours is. Of course Mr. Mackenzie has a perfect right to express his own sentiments upon any such occasion as the Greenock speech, but we think as a matter of policy and in the best interest of Canada, such subjects should be left severely alone. The result of their introduction is simply to give the Conservative press an opportunity of going for him, and has the effect of weakening the force of the many excellent things which form the bulk of the speech. Politics are all right in their place, but politics and emigration don't mix well, and British manufacturers generally care a great deal more for our trade than our politics.

Selected Matter.

THE SEVEN METALS OF THE ANCIENTS.

The ancients had a knowledge of seven metals, viz., gold, silver, copper, tin, iron, lead, and mercury (or quicksilver). They were each sacred to some ruling deity. Homer has mentioned all these except mercury. Mercury was common in the century next before the Christian era. Gold, indestructible, malleable, the richest in color, in its lustre, and its property of not being altered or even affected by the air, has been known from the remotest times. It is the Sol or sun of the all chemists, who represented it by the circle, the emblem of perfection. There are drawings of gold washings on Egyptian tombs as early as 2,500 years before the Christian era, and fine gold wire was made into ornaments—often found on mummies—by the Egyptians 3,500 years ago. It was coined into the heavy *daries* of Persia, and woven into delicate threads that enlivened the flowered stuffs of Babylon. In the earliest days of Greece gold existed in great abundance in the Levant. Crœsus, B. C. 560, coined the golden *stater*, and about B. C. 207, gold coins were first struck off at Rome and were denominated *aurel*. Copper came into use next after silver and before iron. It was called Venus by the ancients, who gave it the symbol of that planet. The age of copper followed the stone age. Homer wrote in the copper age. His famous shield of Achilles is made of gold, silver, and copper, a small quantity of tin being put in to harden it. The shield is itself a proof of the art of design, and the working in metals having attained a very high degree of perfection among the Greeks at a period believed to have been B.C. 962. In a mine near Lake Superior there was found, in 1858, a mass of copper forty-eight feet long, twenty feet

high, and calculated to contain 150 tons. Brass, which has often been confounded by ancients with copper, is merely an alloy made by mixing one-third of zinc with two thirds of copper. Brass was made by the ancients without discovering zinc. Iron, the most important of metals, came into common use long after copper was well-known. It was regarded by the ancients as a symbol of war, and received the name of Mars, the god of arms. Homer mentions a mass of iron as one of the prizes at the funeral games given by Achilles in honor of Patrocius :—

Then buried the hero, thundering on the ground
A mass of iron, an enormous round,
Whose weight and size the circling Greeks admire,
Rude from the furnace, and but shaped by fire.

In 1537 B. C. the Lacedemonians coined iron into money. At Babylon the huge stones of the bridges were held together by bands of iron fixed in places by molten lead. Thucydides tells us that the walls of Pireus were fastened in the same way. In preparing the stone for building the Pyrimids iron was used, Herodotos affirms ; and Iron must have been employed in engraving the beautiful old gems which now are so valuable. The Ninevites made tools of iron, the ancient Britons made spears and lances of it, and the Romans, during their occupation of Britain, smelted iron to a considerable extent. The iron mines of Elba are said to have been worked from the time of Alexander the Great ; and Pliny speaks of this region as "inexhaustible in its iron." The mines of Arragon and New Castile in Spain are supposed to have been worked from the times of the late Jewish kings, successively by the Tyrians, the Carthaginians, and the Romans. Through all the nations of high antiquity iron is mentioned almost always in a way that shows it to have been a partially common but always highly esteemed metal. Indeed, from the difficulty of working it with the primitive means at the command of men just emerged from barbarism, it was held at a high price. Only 153 years ago, Batachoff, in Russia, bartered iron for an equal weight of copper coin. Lead, a blueish-grey metal, was known to the Egyptians at an early date, and is mentioned by Homer; it was used in Rome in pipes to convey water, and in thin sheets for roofing purposes. The powder (cyrussa) used by the Athenian ladies to tint their complexion, was our white lead. Lead owes its usefulness in the metallic state chiefly to its softness and fusibility. In ancient times tin was scarce, and the chief supply was from India, Spain, and the celebrated mines of Cornwall, England, which have been worked uninterruptedly from the earliest historic periods. Tin was used by the Egyptians nearly 4,000 years ago.—*Ex.*

FOES OF THE TELEGRAPH.

If you will kick or pound on a telegraph pole or place your ear against one on a windy day what will the noise remind you of ? A hive of bees ? Precisely. So it does the bears in Norway. Bears are passionately fond of honey, and when in one of the wind districts bruin hears the humming of the wires he follows the sound to the post where it is loudest and begins to tear away the stones heaped round the poles in rocky soil to steady them, in order to get at the hive which he imagines to be there. In his disappointment and disgust he usually leaves savage marks of his claws in the wood. Nor is he the only victim of the wires. In the electric exhibition at Paris, they show the top of a thick pine telegraph pole, through which a woodpecker has drilled a hole several inches in diameter. The bird had apparently perched on the pole and taking the humming of the wires for the buzzing of a nest of insects in the wood, and had set himself manfully—or birdfully—to dig them out. Wolves will not stay in Norway where a telegraph line has been built. It was formerly the custom to protect farms by planting poles around them strung with cords, something like rabbit snares, and gradually the wolves came to respect these precautions so that a line stretched across the neck of the peninsula would protect the whole district. The wolves take the telegraph for a new and improved snare, and promptly leave the country when a line is built. On our own treeless plains the buffalo hails the telegraph pole as an ingenious contrivance for his own benefit. Like all cattle, he delights in scratching himself, and he goes through the performance so energetically that he knocks down the post. An early builder of telegraph lines undertood to protect the posts by inserting brad-awls into the wood, but the thick skinned buffalo found the brad-awls an improvement, as affording him a new sensation, and scratched down more poles than ever. In Sumatra the elephants are systematically opposed to telegraph lines, and at least twenty times a year make raids on them. In May, 1876, the elephants tore down the poles for a distance of several furlongs and hid the wires and insulators in the cane jungle, and for three nights in succession they repeated the performance as regularly as the repairers rebuilt the line during the day. The monkeys and apes are about as formidable enemies, as they use the wires for swings and trapeze and carry off the glass insulators as valuable prizes ; then, when the repairer goes to correct the mischief, he may be pounced upon by a tiger or driven up the post by a mad buffalo. In Japan the special enemies of the telegraph are the spiders, which grow to an immense size and avail themselves of the wires as excellent framework for their webs. So thick are the cords the Japanese spiders spin that often, especially when they are covered with dew, they serve to connect the wires with each other on the ground, and so stop them from working. In the sea the wires are not any safer, as a small worm has developed itself since cables came into fashion which bores its way through iron wire and gutta-percha, lets in the water and so destroys a line worth millions of dollars. When a great storm comes on in the centre of the ocean, and the cable breaks while it is being laid, or threatens to break, no one is alarmed. They fasten the cable to a buoy and come back afterward and pick it up ; or if it is at the bottom of the sea they drop a dredge, with a mile or so of rope, and fish out the precious thread, as large as one of your fingers, almost as easy as you would fish up a penny from the bottom of a tub of water with the tongs. But the little worm, no bigger than a needle, is more formidable than the elements or the hurricane.—*Ex.*

THE WATCH RACKET.

From the Hamilton Spectator.

The Toronto *Globe* Printing Company makes announcement that it has gone into the intellectual and exhilarating business of peddling nickel watches. In order to facilitate the business the company has erected a tent on the exhibition grounds, where the watches and the *Weekly Globe* will compete with circus lemonade and fat women for popular favour. The cases will be elegantly illustrated with wood-cut engravings,

wholly regardless of cost, and every separate and individual watch will be warranted to go as long as anyone will carry it. Each implement will be provided with a patent safety-valve and stem-winding attachment guaranteed to make the hands go round so long as anybody grinds at the crank. The whole business to be shipped to any address in Canada or the United States postage paid, and insured against fire, pirates, and death from old age while in transit; and the price is fixed at the ridiculous low sum of $3.50, while the *Weekly Globe* for fifteen months will be thrown in as an inducement. In the language of the advertisement, this is "a liberal and magnificent offer."

With one of these watches in his pocket every consistent Reformer will be able to rise as soon as he wakes in the morning, grease his boots, and polish up the watch-case with a little brickdust and tallow till it shines like Mr. Mowat's countenance or Major Walker's reputation. He can then go out and regulate the rising of the sun. When he goes fishing he can use the watch for an anchor; and when he is disposed to be extravagant, it will be a silent monitor of the value of cash payments by reminding him that there is "no trick here." It will incline him to turn his thoughts to the things of eternity, because it will resolutely refuse to take any note of time. It will be warranted to make its owner a free trader because he will freely trade it for a jack-knife or a mess of string beans. It will firmly convince him that the Tories will never get into power in Ontario, because he will mentally associate the watch with Mr. Mowat; and he will never have any difficulty in persuading himself that the watch will not go.

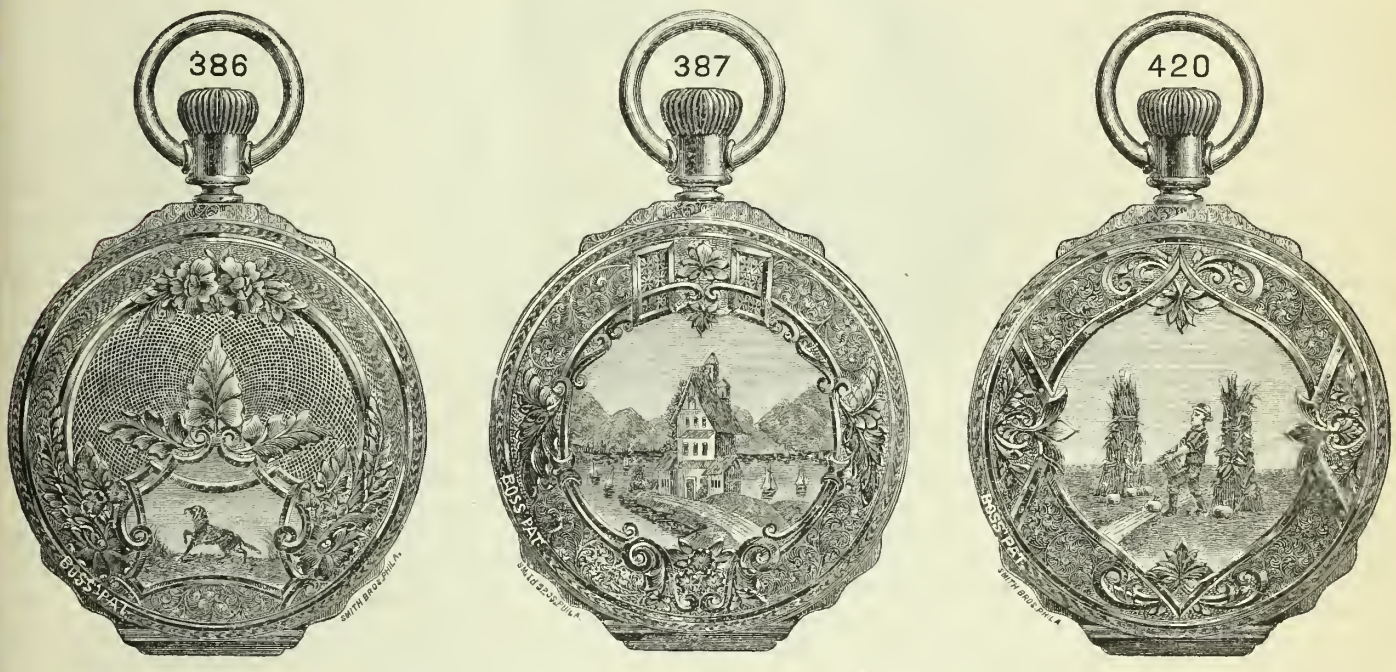
It is difficult to learn from the advertisement whether a watch is to be given as a bribe to induce people to read the *Globe*, or whether the *Globe* is to be thrown in as an inducement to buy a watch. The two are fitly associated. The *Globe* is just the paper one would expect to find in company with a $3.50 watch. The people who would put faith in a $3.50 watch are just those who would be apt to believe a *Globe* editoral. No doubt the watch peddling business will be successful, because the man who could be bribed to read the *Globe* can no doubt be caught by the offer of a $3.50 watch as well as by something of commercial value. It would be gratifying to see the man. He who could sit with the *Weekly Globe* in one hand and the *Globe's* pewter watch in the other, all for the modest sum of $3.50, and have his picture taken in the attitude of one resolved to defend Ontario's rights to the last gasp, would be a man whose photograph we should like to have —not for its intrinsic worth, but as a reminder that simple trust and guileless innocence have not yet perished from the earth.

GEMS AS CURES.

A writer in one of the English magazines says: In both the Greek and Roman writers there are endless references to the curative power of precious stones. From many of the allusions it appears that the dictates of fashion here, as everywhere else, had much influence over the prevailing belief in the virtue of particular stones, now one and now another being held up as specially efficacious for the cure of certain diseases. Thus, while the "Crystals" and the "Adamas" stood for a long time among the Greeks at the head of the medicinal agents, that position was afterward assumed by the "Sardius," or the Oriental carnelian. "No other stone," records Pliny, "was so great a favorite with the Greeks as this, and the plays of Menander and Philemon abound in allusions to it." The cause of this favoritism lay probably in the facility with which the carnelian could be cut by the engraver, the dull red flesh-colored stone offering by itself no other attractions. Such engraved stones, either in the form of intaglois or of cameos, constitute to some extent an epoch in the history of gems, as it modified the original idea of stones being possessed of inherent virtues. To this came now to be added the conception that these powers might be raised or changed by pictures and inscriptions from the hand of the engraver.

The current of ideas that led to the engraving on precious stones is very clearly sketched out by Camillo Lionardo, an Italian writer of the fifteenth century, himself a firm believer in the power of "charms" and "amulets." Taking up the argument that the ancient Greeks and Romans, following in the footsteps of the Egyptians and Persians, were perfectly reasonable in attaching value to engraved stones, Lionardo goes on to say: "All things in nature have a certain form, and are subject to certain influences. So, also, precious stones, being natural productions, have a prescribed form, and as such are subject to the universal influence of the planets. Hence, if these stones be engraved by a skillful person, under some particular influence, they receive a special virtue, as if they had been endowed with additional power by that engraving. And should it happen that the power intended by the engraving be the same as that of the natural quality of the stone, its particular virtue will be doubled, and thereby its efficacy greatly augmented."

SELLING THE JEWELS.



The Plantegenets were very rough-and-ready financiers. When Richard I. took it into his head to try conclusions with Saladin, he raised the needful by turning the crown manors and the fortresses of Roxburg and Berwick into hard cash, selling offices of trust to the best bidders, and did not hesitate to avow that he would dispose of London itself if a purchaser was forthcoming. Strangely enough, Cœur de Lion never seems to have thought of doing the same by his crown jewels. Henry III. was the first English monarch who had recourse to that undignified expedient. The idea, indeed, did not originate with him; for it is recorded that when some person or persons unknown suggested the replenishing of the royal coffers by selling the crown plate and jewelry the King hinted a doubt as to the likelihood of finding purchasers, and being assured that the citizens of London would gladly accommodate him. Henry exclaimed: "On my word, if the treasury of Augustus were brought to sale, the citizens are able to be the purchasers. These clowns, who assume to themselves the name of Barons, abound in everything, while we are reduced to necessities!" Notwithstanding his indignation, Henry, like other men in his predictment, was willing enough to deal with the full-pursed ones he abused, and so, in 1248, he sold the citizens of London all the plate and jewelry he had already mortgaged to the merchants of France. The relief afforded was, however, only a temporary one, for seven years later we find him demanding 8,000 marks of the Jews, and answering their remonstrance against the exac-

NEW LINE

—OF—

Jas. Boss' Gold Watch Cases.

THE LOUIS XIV OR BOX JOINT STYLE.

These Cases are engraved in all designs now being used on our regular goods, as well as a special line, particularly adapted to this style of case.

THE BOX JOINTS ARE ALL MADE OF SOLID 14k. GOLD.

The JAS. BOSS GOLD WATCH CASES are unapproached in quality, construction, finish and ornamentation.

THE GOLD USED UPON THEM ASSAYS $14\frac{2}{10}$ KARAT BY U S. MINT ASSAY.

All of the parts most subject to wear are made of SOLID GOLD. They are not gilded to make them look better than they really are, consequently will not change color in a short time, to the annoyance of the dealer and disgust of his customer.

For Sale by all Canadian Jobbers.

tion by pleading that he was a beggar, spoiled and stripped of all his revenues, without a farthing wherewith to keep himself, and therefore must have money from any hand and by any means.—*All the Year Round.*

A LUCKY FIND.

In 1847 Godfrey Luther and his son were engaged in gold mining on Wilson's branch, in what is now Wilson's district in this country. Their appliances were of the rudest kind, consisting of sluice and rifle boxes and the traditional miner's pan. On one occasion, Col. John E. Redwine, then a lad of about 16, was sent by his father to Mr. Luther's works to see him about some business matter. While there the elder Luther and some other gentlemen walked off some little distance, and he continued in conversation with the young man, who was "panning out" some earth and showing Redwine the gold. In one pan he noticed an exceedingly beautiful pebble, and called Mr. Redwine's attention to it, and while they were admiring it the other gentleman returned, and they also noticed its beauty. The gentlemen, without any idea of its value, remarked to the boy, "I'll give you a dime for it." "All right," said he, and accepted it gladly. Some time afterward the gentleman was in Gainesville and showed the stone to Dr. Daniel. That gentleman believed it to be a diamond, but finally paid the gentleman $30 for it and took the stone He sent it to London, there being at that time no diamond cutters in the United States, where experts pronounced it a diamond of the first water, and he received for it $300. It was afterward rumoured that it sold for a much larger sum than this, but nothing is known positively of its history beyond its sale in London.—*Gainesville (Ga) Eagle.*

MINUTE WORKMANSHIP.

The Salem Museum, Massachusetts, has in its possession a cherry stone containing one dozen silver spoons. The stone is of the ordinary size, the spoons being so small that their shape and finish can be distinguished only by the microscope. This is the result of immense labor for no decidedly useful purpose, and there are numbers of other objects in existence the value of which may be said to be quiet as indifferent. Thus, Dr. Oliver gives an account of a cherry stone on which were carved 124 heads, so distinctly that the naked eye could distinguish those belonging to popes and kings by there miters and crowns. A Nuremberg top maker inclosed in a cherry stone which was exhibited at the French Crystal Palace, a plan of Sebastopol, a railway station, and the "Messiah" of Klopstock. Pliny, too, mentions the fact that Homer's Iliad, with its 15,000 verses, was written in so small a space as to be contained in a nutshell. The greatest curiosity of all, however, was a copy of the Bible written by one Peter Bales, a chancery clerk, in so small a book that it could be inclosed within the shell of an English walnut.—*Ex.*

PEARL SHELLS.

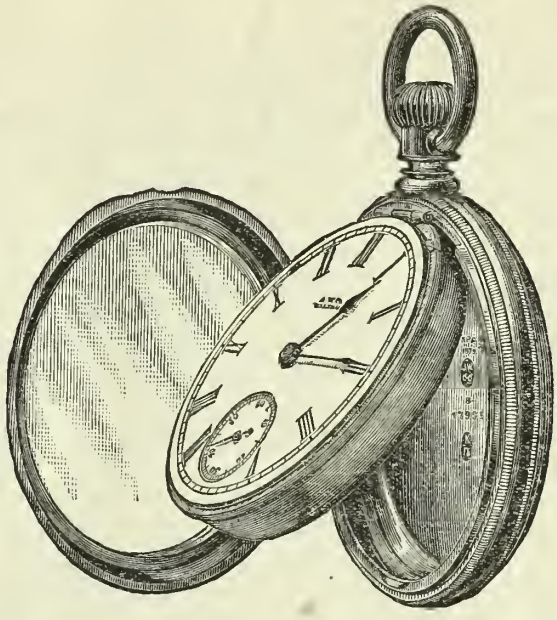
The *Central Anzieger* contains the following item from Adorf, the chief seat of the German mother-of-pearl industry:

Our mother-of-pearl industry, principally engaged in the manufacture of *articles de luxe*, generally are received only after New Year; but this time our workmen were busily engaged. Orders from America have again been received plentifully, and give rise to the hope that work will be abundant. We must remark about the source of supply of the crude shells, that until now Liverpool supplied all demands, being the centre of shell seekers. But according to an item in an American newspaper, America again enters into competition with England. The steamer *Burswell* sailed at the end of last year to Havre, loaded, among other things, with thirty-six hogsheads of pearl shells, which were sent to a manufacturer at Paris. Should they turn out to be good, America will soon be able to send more. In the factories at Adorf, the American sweet-water shell *Cassia*, has been used already, but it is said that the aforesaid vessel transported a new sea shell, found on the southern coast of California, and took them as samples to be tested. That also very valuable finds of shells may be made, is shown by the circumstances that, in 1827, a Paris professor paid the sum of 6,000 francs for a *Spondylus regulus*, and that a few years ago in London, a very handsome shell, without pearl, was sold at auction at 1,200 francs. Should America seriously enter the market as shell furnisher, the crude material will at least not become dearer.

ENGLISH AND AMERICAN BRAIN AND HAND WORK.

In the September number of the *Atlantic Monthly*, Mr. Richard Grant White has given a very gracefully written and interesting account of a visit to Oxford and Cambridge and of what he saw there.

He says: "Nothing impressed me more constantly and more pleasantly in England than the absence of 'drive.' Everybody seemed to take life easily; nobody seemed to be very hard worked, and yet the amount of effective work of all kinds done in England, whether with hand or head, is very much greater than that which is done in America."



The implication is that in this country people work in a hurry and accomplish less than in England, where they keep cool and go slow. Now, we are prepared to dispute this proposition with reference to hand work and also with reference to head work, except in a peculiar literary field. In philosophy and in the higher walks of literature, England excels America; in scientific thought or in mechanical handiwork, in proportion to the numbers engaged in such pursuits, America outstrips England. It is a noted fact that, with regard to mechanical and manufacturing operations, in proportion to the help employed in our establishments, a far greater amount of production is accomplished than in English establishments, and it is owing to this fact that, notwithstanding the much higher price of labor with us, we have been enabled to enter the markets of the world and successfully compete with England, even in the products in which she has, till within a few years, held a monopoly.

Englishmen coming to this country and entering our machine-shops are astonished at the rapidity with which certain kinds of work are performed. Americans visiting English work-shops are equally astonished at the slowness with which these operations proceed.

The reason why England excels us in the higher walks of literature and philosophy is that a greater number of workers exist there, who are, on account of their wealth, possessed of leisure to persistently pursue any course of study which interests them. Here, nearly every student is obliged to devote more

THE AMERICAN WATCH CO.'S

PATENT DUST-PROOF STEM-WINDER,

—AND—

WHAT AN IOWA JEWELER SAYS OF IT.

(Extract from a letter written by C. S. RAYMOND, Clinton, Iowa, April 29, 1881:)

"I wish you would send me a Spring for the Wm. Ellery Watch. * * * * * 'By the way, this Ellery is a watch I sold to a farmer, in your Screw Bezel Case, last Fall. The first of January he "lost the watch in the woods and found it this week in about one foot of water. It had lain three months and "over in snow and water, with but a slight injury to the watch—only a hair spring."

The above, as will be seen, was a very severe test, and demonstrates that, for a reasonable length of time, during which a watch might be under water, it would receive no injury whatever.

We wish to call attention to the fact, that although we do not guarantee such cases to be absolutely water-tight, many of them are, and nearly all can be made so, with a little care and attention to details, such as thoroughly cementing the glass, etc.

As a Perfectly DUST-PROOF Stem-Winding Watch Case, we challenge the world to produce its equal.

ROBBINS & APPLETON.

SOLE AGENTS.

NEW YORK. BOSTON. CHICAGO

or less time to some occupation by which he can gain a livelihood.—*American Machinist.*

We fully coincide with the above criticism quoted from the *American Machinist*, and remark that so far as the horological jewelry and silverware trades of this country are concerned, while their artizans have lacked almost all of the ordinary means of technical education in their various trades, having no organizations, schools, libraries, or historical past with its "old masters" from which to draw knowledge and inspiration, they entered their own market to find it occupied by experienced and wealthy foreign competitors, while they were absolutely unknown in any other. The "absence of drive," "the taking life easy" among her law-makers and tradesmen, the nursing of pride and prejudice in trade, the catering to the trade of royalty and government "boards" has given to the busy, inventive, persistent Yankee an opportunity to catch the ear, please the eye, and favor the pockets of the general public everywhere. As a result our factories in these trades, and they are many, are busy without exception, and unless England listens to others than such "graceful" and pleasant writers than Mr. Richard Grant White, and provides more wholesome regulations for her tradesmen her manufacturing interests in the lines for which we speak, will remain in the very "unsatisfactory state" in which they are to-day.—*Jewelers' Journal.*

MICA MASKS.

A well known German manufacturer of mica wares, Herr Raphael of Breslau, now makes mica masks for the face, which are quite transparent, very light, and are affected neither by heat nor by acids. They afford good protection to all workmen who are liable to be injured by heat, dust, or noxious vapours, to all workers with fire, metal and glass melters, stonemasons, etc. In all kinds of grinding and polishing work the flying fragments rebound from the arched mica plates of the mask without injuring them. These plates are fixed in a metallic frame, which is well isolated by means of asbetos, so as not to be attacked by heat or acid. These masks allow the turning of the eyes in any direction, and, as against mica spectacles, they afford the advantage of protection to the whole face. In certain cases the neck and shoulders may also be guarded by a sheet of cloth impregnated with fireproof material, or by asbestos sheet, attached to the mask. The interval between the mica and the eyes allows of workmen who have poor eyesight wearing spectacles, and of workers with fire or in melting operations wearing colored glass spectacles under the mask without fear of breakage of the glass, mica being such a bad conductor of heat. Where the mask has to be worn long it is found desirable to add a caoutchouc tube with mouthpiece for admission of fresh air; the tube passes out to the shoulders, where its funnel-shaped end (sometimes holding a moistened sponge) is supported. The mask has a sort of cap attached to it for fixture on the head.—*London Times.*

HOW INDIANS MAKE JEWELRY.

The California sea shell is a regular article of trade among the wild tribes of Indians on the Plains, as well as among the civilized ones. The shells are about one-fifth of an inch in thickness, five or six inches long, and 4 inches broad. They are shaped like a saucer, and the outside is prismatic, the colors often merging into blue, green, pink and gold. Near the edge the shell is very thin and delicate, but hard to break. The Indians saw it into pieces, some round, others square, oblong or pendant, and these they string together by means of wire passed through little holes bored in the pieces. Brass beads are often strung on wires, as a sort of washer, between different parts of the earring, while those suspended on sinews form the pendants. A large brass ring for the ear generally begins a Sioux earring, and to this are hung five or six pendants, made of beads, supported on wire; to these pendants are attached a cross-piece of green hide or wood, then another column of pendants. To these are hung large and small beads, then another cross-piece and next three large wampum beads, beneath which is suspended the piece of shell that gives the earring its value. A shell will make one pair of rings, and it generally costs two robes, or $6. They are something over a foot long, and from three to four inches in breadth at their widest portion. What the ears of the Indians are made of, to withstand such a strain, is a mystery; but pride and vanity tell the story of the savage as well as the more civilized dwellers in the cities and towns.—*Jewelers' Journal.*

FORMATION OF DIAMONDS.

We do not know in which of her laboratories or by what long process of distillation nature forms the glittering grains for which souls and kingdoms have been bartered. "Very seldom it is, and thought a miracle, to meet with a diamond in a vein of gold," says Phil Holland, translating Pliny, "and yet it seemeth as though it should grow nowhere but in gold." That was a curious philosophy, not quite extinct, which supposed itself able to guess where things should grow. In Balzac's novel, "La Recherche de l'Absolu," the same theory survives. The hero is "trying to get the Absolute into a corner" by means of alchemy. He does not quite succeed with the Absolute; but when all his means are exhausted, his crucibles cold, his furnace faded out, his friends find diamonds in the sediment of one of his alchemical messes. Diamonds really were found in gold, or at least in auriferious strata, by gold diggers on the Mudgee, in Australia. In 1829 they were found in the gold washings on the European side of the Ural Mountains. Believers in the old "sympathetic" philosophy would have had that Nature was half consciously putting forth her noblest productive energies and combining her choicest ingredients in these districts. The gold was comparatively her failure, the diamonds (people would have said) her success. And just as alchemists tried to distil out of gold, as the most perfect substance, the elixir of life, so they would naturally have tried to make diamonds out of gold. Not till early in the seventeenth century did people even guess that the diamond was an inflammable substance. "Neither was it known for a long time," says the old translator of Pliny, "what a diamant was, unless it were by some kings and princes, and those but few." As to its combustible qualities, the ancient writer flatly denies them. "Wonderful and menarrable is the hardness of a diamant; besides it hath the nature to conquer the Furie of Fire; nay, you shall never make it hot, do what you can." Yet the members of the Academy of Florence "made it hot" for the diamond in 1694

The "Excelsior" Patent Dust Proof Case.

PATENTED,

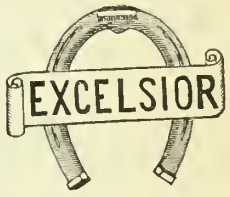
United States,

27th December,

1881.

PATENTED,

Dom. of Canada



28th February

1882.

This is the first and only case made without one grain of solder. Every piece is cut from thesolid metal and pressed into the shape used in the case. This process hardens the gold and silver by the only method known (that is to work it), and is handed to the Trade as hard as is possible to make it, being a great advantage over a case made in the ordinary way, in saving gold and silver by making a case as strong as a much heavier one that has been softened as heat does in soldering on pendant, joints, thumb catches, or joint to swing movement in. Heat not only softens the gold or silver, but warps it out of the shape that the snaps have been fitted to, and it is never perfect after soldering. The Excelsior Patent Dust Proof is never soldered, never heated, is fitted perfectly, and remains perfect. The Excelsior Dust Proof has no joints to wear out or break off. The Excelsior Patent Dust Proof has no spring to break or wear the case. There is no part of the Excelsior Patent Dust Proof that will wear. The Excelsior Patent Dust Proof is the safest case made for protecting the movement—it will never open in the pocket Put an Excelsior Dust Proof in your pocket, bend forward, backward, put yourself in any position you please and the Excelsior is closed tight. In an ordinary case, with springs, by bending forward the case will often open and when the lock-spring is worn, the case is nearly always open.

The Excelsior Patent Dust Proof Case is the strongest, best fitting and most durable case made. Ask your Jobber for the Excelsior Patent Dust Proof. Every case warranted as stamped, 18 kt., 14 kt., 12 kt., 10 kt., United States Mint Assay or Coin Silver, as may be stamped, and every genuine case bears the Trade Mark. The Excelsior Patent Dust Proof Case may be obtained from any of the jobbing houses in the country.

Trade Mark.

Instructions to Open the Excelsior Patent Dust Proof Case.

First press the crown as in opening an ordinary Hunting Cased Watch, then to open front, turn bow to the right with thumb and finger; to open the back, turn left. To close, turn case back in same position as when case was closed, and snap same as glass bezel on any watch.

in the presence of Cosmo III, and these experiments at high temperature led to the discovery of the essential nature of the stone. Notwithstanding the alleged discovery of a process for making artificial diamonds, fine goods are commanding a higher price than heretofore, because of their growing scarcety. Preference is given to stones having a faint blue tint. Small first water stones from ¼ to a carat are quite scarce, large quantities of them being worked up into fine jewelry. Owners of genuine diamonds need not get stampeded just at present over this artificial diamond bugbear.—*Ex.*

MUSICAL BOXES.

Almost from the earliest history of clocks and clock-work, dates also the history and use of mechanical music. Bells upon church towers, from being sounded at stated intervals by ecclesiastics, came to be acted upon by clock mechanism, and which, in the process of time, from striking the hours, was required to announce also the quarters. The lingering sweetness of these tones begot the desire for chimes, a species of music very common upon ancient churches, and which has decended to our time. The ringing of these chimes was a duty which demanded some musical skill, as well as considerable muscular effort. These duties were also, in time, put upon the clock machinery, and hence arose the invention of barrels for ringing these chimes.

From the ringing of chimes by a cylinder revolved by the clock in the bell towers, naturally enough grew the custom of so constructing the cylinder as to play simple airs upon the chime bells. From this beginning sprung barrel organs ; that is, those musical machines which depend upon the action of air upon reeds or pipes for their tones. The principles of construction are the same, whether it be a chime of bells in a church tower, a hand organ on a beggar's back, or a music box in a lady's boudoir ; each are operated by a revolving cylinder with projections upon it for actuating mechanism that produces musical tones ; the only difference being, that in those instruments where the tones are from pipes or reeds, the valves which admit the air must be held open during the continuance of the tone ; consequently, the projections upon the barrel must be more than points or pins, which would give only a single explosive note. To do this, a bridge or staple is used for such notes, and of a length proportioned to the time the note is to be prolonged.—*Jewelers' Journal.*

BUSINESS CHANGES FOR SEPTEMBER.

Geo. Eddleston, stoves and tins, Stratford, sold out to James Nesbit. M. Myers, jewelry, Montreal, stock slightly damaged by smoke and water. John Woltz, jewelry, Winnipeg, sheriff in possession. Miss Scott, Woodstock, fancy goods, sold out to Miss Wood. R. Y. Ripple & Co., Hardware, Brandon, assigned in trust. Saunders & Kersch, Stoves & Tins, Emerson, about removing to Manitoba City. Walton & Bird, Hardware, Emerson, about opening a branch at Manitoba City. T. L. Dodge & Co., Hardware, Kentville, dissolved ; Dodge continues under old style. Wm. Thomson & Co., crockery, Toronto, advertise business for sale 20th inst. Thos. McGratton, Uxbridge, tins, damaged by fire. A. McLean, Brandon, Hardware, Sheriff in possession. Geo. Elliot, tinsmith, Fredericton, N. B., away. T. J. Carrol, Jeweler, Hamilton, sold out. J. J. Campbell & Co., dry goods, Regina, assigned in trust. Horsman & Co., Hardware, Winnipeg, assigned in trust. Cameron and Westcott, hardware, Beaverton, assigned in trust.

BUSINESS NOTES.

The firm of Hadden & Rorabeck, hardware merchants, Picton, dissolved Oct. 1st. E. H. Rorabeck retiring, R. Hadden continuing the business.

A large hardware firm in Winnipeg, Horsman & Co., has assigned with liabilities, as shown a month ago, of $24,000, and assets $38,000. They will probably be able to effect a compromise with creditors.

We understand that J. R. Ormond, jeweler, of Winnipeg, has had his stock seized by the Customs authorities for smuggling, and that he is likely to have several thousand dollars' worth of goods confiscated.

The firm of Metcalf & Stephen of Blyth, Ont., jewelers and stationers, have dissolved partnership. The firm have succeeded in working up a splendid trade. The business is to be continued by F. Metcalf for whom we wish every success.

We regret to announce the death of Mr. Cleary, of the firm of Nerlich & Co., wholesale Fancy Goods dealers, of this city. Mr. Cleary was a true gentleman, and will be deeply regretted by every one who had the pleasure of his acquaintance.

A cent stamp, partly on the wrapper and partly on the newspaper, in the United States, constitutes it a sealed package, and the package will go only to the dead letter office. The public are interested in having this official triviality more widely known.

One Saturday morning last month the steamer *Annie Craig*, specially chartered, conveyed the employees of P. W. Ellis & Co., numbering about 150, to Victoria Park, where they held their annual picnic, by the kind permission of Ex-Ald. Lobb. A long programme of athletic games were closely contested, comprising many interesting features.

Advertising is to business what food is to existence. It should be regular, adequate and varied. Large advertisements pay better in proportion than small ones. The object is to be seen and remembered. A business man should have an attractive advertisement just as much as he would have an attractive show window in his store, if the latter is in a prominent place. How much more prominent is a good newspaper.

The Montreal Customs authorities have been going for several of the retail customers of the jobbing firms recently fined for smuggling in that city. We understand that amongst others Mr. Bailey of Cornwall had his stock seized, but he was fortunately able to show that he had no connection with the smuggled goods and thus got off. Retail dealers for this reason should be very careful to buy goods only from reliable houses, if they don't, they may find themselves minus of their extra cheap goods some day, the customs people having a prior claim to them.

Says the *Globe's* Winnipeg correspondent :—"John Woltz, identified with teller Andrews in the recent Imperial Bank embezzlement of $13,000, has been again arrested and was lodged in the Provincial gaol last night on a charge of forgery. The charges are based on cheques as follows :—A cheque on the Bank of Ottawa for $900, signed E. Roll and payable to bearer ; a cheque on the Federal Bank for $678, signed Wm. Stephen and made payable to J. A. Ross or bearer ; a cheque on the Federal Bank for $600, signed by Wm. Stephens and payable to bearer ; and a cheque on the Federal for $678, signed by Wm. Stephens and payable to J. A. Ross. The prisoner was taken before Police Magistrate Peebles this morning and remanded until Saturday."

A new firm in this city, Rae & Watson, offer to business men what has been long a desideratum, viz : facilities for sending parcels from this side of the water to the old country. This they are in a position to do from having the agency for Wheatly's Globe Foreign express. London and Liverpool, which does a considerable business already in shipping parcels to Canada. The new firm, one of whom was with Morrison, Taylor & Co., and the other with Rice Lewis & Son, have a good record and have some desirable agencies. That for example of Wm. Cook & Sons, Glasgow steel and file works, and Andrew Mitchell & Co., sack manufacturers. They also propose doing a general commission business.

Mr. A. Kleiser, dealer in watchmakers' supplies, No. 14 King street east, and Mr. S. Saniger, manufacturing jeweler in the same building, had a visit from certain toilers of the night last month. Before leaving their places of business both gentlemen put their valuables in their respective safes, and locked carefully their respective doors. When Mr. Kleiser came down town in the morning he found that his door had been forced, and an attempt made to break open his safe, and Mr. Saniger had the same experience. Whoever the housebreakers were they were not good workmen, as there was evidence that their work was of the rough-

SIMPSON, HALL, MILLER & CO.,

est description. Nothing has been missed, save a few trivial articles from the rooms, and it is thought that the thieves were disturbed before they had been long on the premises.

Referring to the exhibit of silver plated ware by the Toronto Silver Plate Company at the late Toronto Industrial Exhibition, the *Mail* says :—

"Those who admire the silversmith's art and beautiful sideboards and table ornaments should see the magnificent display of the Toronto Silver Plating Company, near the centre of the main building. All the goods shown in the case were designed, moulded, and finished at the company's works on King street, this city, and so great has been the demand for this style of work that where twelve men were employed a year ago, thirty men are now engaged in the different branches. The six epergnes shown are equal, if not superior, to any that can be made outside this city, the designs being of the handsomest and the work of the most artistic. In the east front of the case is a set of majolica table ware, mounted in heavy plate, which will compare favourably with anything from Europe. There are wine urns, Bohemian vases, Wedgewood ware, strawberry and cream dishes, fruit dishes, cut glass claret jugs, opaque and damask gold vases, tilting ice pitchers, tete-a-tete sets. There is a beautiful salad bowl, hand painted, and oxidized in gold and silver. The delicate tracing and repousse work on some of the exhibits surprise those who keep no account of the strides of art in this city. The dispay attracts great attention."

Says the *Coaticook Observer* :—"In relation to the seizure of jewelry made here on the 7th instant, we learn that the facts are as follows : Information had been given that J. H. Jones & Co., of Montreal, had some time ago, *had* some jewelry smuggled through for them, and, in consequence, the Custom Officer Lemoine when he saw W. F. Jones here went to Collector Williams for instructions, the Collector said examine him. This was done by Lemoine in presence of Collector, and Jones was politely asked for his invoices. He had none, alleging that all invoices were in Montreal, where all their goods were entered. To accommodate Mr. Jones, Collector Williams sent the trun of jewelry into Montreal in charge of Officer Lemoine, who handed it over to the Customs there. We have since learnt that Mr. Jones, in return for Mr. Collector Williams accommodation, no doubt, has turned around quite savage and abused the Coaticook Customs for daring to suspect the honesty of his house. It seems to us that Mr. Jones is just as amenable to customs inspection as any other trader, and has been treated far better than our townsman. A. O. Norton, who was knocked about by the Montreal Customs for seven days, and put to considerable expense, because some *would-be virtuous* person said he was a smuggler."

"DONE UP" FOR DIAMONDS.

HOW A HOTEL CLERK SWINDLED THREE TORONTO JEWELERS.

Wm. P. Sawyer, the young man with the terra cotta hair and moustache, who for the past six months was to be seen behind the desk at the Rossin house performing the duties of clerk, handed in his resignation to Chief Clerk Nolan Wednesday morning without previous notice. Mr. Nolan was taken somewhat by surprise but said nothing. He examined Sawyer's accounts and found them correct. Sawyer said his reason for leaving was that he wished to return to the boot and shoe business with Mr. Brown in Queen street west. The proprietor of the hotel subsequently had a talk with the young man and told him that there was something on his mind. "Whatever it is," said Mr. Irish, "I would advise you to get rid of it, as it is nothing good." As will be seen by the sequel, Mr. Irish's words proved to be prophetic. Nothing further passed then and Sawyer was paid off. About noon an express package from Chicago marked $500 arrived at the hotel for Sawyer. It was placed in the safe, pending the ex-clerk's return. He came back between 1 and 2 and on being informed of the arrival of the package requested that it be allowed to remain in the safe, as he did not wish to use the money just then, all of which turned out to be part of the game that Sawyer thereupon set out to play.

The nice young man did a rushing and most successful swindling business in the next two hours. From Ellis & Son, jewelers, he bought two sets of diamond ear-drops for $650, tendering in payment a check on the Home Savings & Loan Co., Church street. Mr. Ellis knew his purchaser and accepted the check, which was made payable on the 28th. Sawyer bore off his diamonds in triumph. He next presented himself at C. & J. Allen's establishment, where, through the same device, he obtained precious gems to the value of $500. Woltz Bros. were his next victims. He wanted to purchase largely from them with a check, but they refused to accept it, although they let him have a $125 ring on the promise of his paying them the next day. Mr. Sawyer now thought that he had all the diamonds he wanted and went into the bogus draft business, obtaining an advance of $187 on one from Gzowski & Buchan. The draft was drawn on a Chicago firm. This ended Mr. Sawyer's operations and he immediately made himself scarce.

Between three and four o'clock Mr. Ellis enquired for Sawyer at the Rossin house and was informed that he was no longer connected with that hostelry. In reply to Mr. Irish, the jeweler said Sawyer owed him a small amount: Had Mr. Ellis stated the real nature of Sawyer's transaction with him, Mr. Irish thinks there would have been time to have headed the swindler off. But Mr. Ellis did not do so then, but proceeded to the Home Savings company's office where he learned to his dismay that Sawyer had no account at all. In the meantime Mr. Irish's suspicions were aroused and he took the liberty in presence of witnesses to open the $500 package, when lo and behold he found not a pile of crisp greenbacks but blank tissue paper. It was at once apparent that Sawyer was working some scheme, but the Rossin house folks could not fathom it, as they had not heard of his afternoon's exploits. Later on when Mr. Ellis, Mr. Allen and the other victims came to the hotel and told all, Sawyer's game was seen through. In the first place he must have had arranged with a confederate in Chicago to send on the $500 package so as to arrive Wednesday, which would give him an opportunity to work the town that day. His object in allowing the valuable (?) package to remain in the safe was to allay suspicion, in the event of enquiry at the hotel as to his financial standing. The draft, too, is supposed to be part of the confederate's work. The scheme was well laid and it was successfully operated, Sawyer being ahead $1275 worth of diamonds and $187 in cash. The case was of course reported to the police but there is not much chance of catching the swindler, as he is doubtless by this time across the border, slyly laughing in his sleeve.—*Toronto World.*

WORKSHOP NOTES.

Solders.—Fine gold, 8 parts ; fine silver, 10½ ; copper, 5½ ; or 13½ karat gold, 10 parts ; fine silver, 5 ; zinc, 1 ; it is necessary, however, to say that the latter solder cannot be used for articles to be colored, and it is well to remember that any solder containing zinc cannot be used for coloring, as it turns black.

A silver solder not very hard of fusion consists of 1 part silver, and 1 finest alloy brass, or, 20 parts 12-part silver, 3 zinc ; fine silver, 5 parts ; fine alloy brass, 6 ; zinc, 2 ; this composition is very quick of fusion, but less malleable than those commonly employed, owing to its great percentage of zinc (20 per cent).

Protecting Silverware.—Table ware and other articles of silver, solid as well as plated, invariably become tarnished if not used for some time, especially if stone coal is burned in the house or neighborhood, owing to the sulphur it contains. Such tarnishing, however, may completely be prevented by first heating the ware and afterward anointing it with a coating of collodion thinly diluted with alcohol, laid on with a camel's hair brush. This coating dries at once and forms a very thin, transparent film, which completely protects the silver, and which, if necessary, is quickly removed by hot water. The method is much used in English silverware stores, to protect the ware against tarnishing.

Mosaic Gold.—One pound pure tin is melted. ½ pound mercury which first has been heated in an iron spoon until it commences to smoke is poured into the molten metal, and stirred with an iron rod, when cold, a lump is found, which must be rubbed, and when reduced to powder, ½ pound purified sal ammonia, and ½ pound flour of sulphur is incorporated with it The powder is then put into a glass alembic this set into a glass capel, and fired little by little, until the sand is at a glow heat. After the cooling, the alembic is broken, and its upper layer within will be sal ammoniac, below zinnabar, and lastly the mosaic gold, in shape of a gold colored glittering mass, weighing about 1-12 more than the tin supplied.

To Impart a Finely Ground Surface to a Glass Plate.—For this purpose, use a very fine sand, river, or what is still better, the sediment from grindstone. Stir either of these in a vessel filled with water ; after a few minutes, the upper half of the fluid will begin to clear up, and this part, containing all the finer parts of the agent employed, is dipped off with a watch glass. MARK.

OBSERVE

this Trade Mark is stamped on all Knives, Forks, Spoons and other flat ware of our manufacture.

The A 1 Goods are Standard Heavy Plate, and XII signifies that in addition the articles have an extra quantity of Silver on all the parts most exposed to wear.

The Meriden Britannia Company have been awarded the highest premiums wherever exhibited, from the WORLD'S FAIR, 1863, to the PRESENT TIME, and the high reputation of our Goods throughout the world has induced other makers to imitate our Trade Marks and name as well as our designs, and as many of our patrons have, through a similarity of names, purchased inferior goods under the impression that they were our manufacture, we are compelled to ask especial attention to our Trade Marks.

THE FACT THAT OUR NAME AND TRADE MARKS ARE BEING SO CLOSELY IMITATED SHOULD BE A SUFFICIENT GUARANTEE TO THE PUBLIC THAT OUR WARES ARE THE BEST IN THE WORLD.

WE RE-PLATE OLD WORK AND MAKE IT EQUAL TO NEW.

glass plate to be treated is laid upon a damp cloth spread upon a table, and of the aforesaid fluid a sufficient quantity is put upon the plate, and the watch glass is used for rubbing, its convexity offering a firm hold to the fingers. In about ¼ hour a very nice satin-like polish is obtained; by rinsing with water you will satisfy yourself that the grinding has been uniform.

—The *Deutsche Uhrm. Ztg.* contains a short recipe for small watchmakers, who only at odd times are called upon to do gilding, watch-parts or other small articles, and by which the use of a battery is entirely dispensed with. It says, when wheels or other parts of a watch are disfigured by hard usage or botch repairing, and the watch otherwise is in fair order, but would look better by being regilt, clean the parts thoroughly, grind and scratch brush them; next procure from a drug store or photograph material store, one part chloride of gold, and four parts cyanide of potash, dissolve the two together in boiling water, and the gold bath is ready; into this suspend the articles to be gilt by a thin copper wire, which is hung on a clean scraped stripe of zinc, and leave it immersed for a few minutes, when the articles will be handsomely gilt in a simple manner.

Annealing Steel Parts.—A communication to the *Deutsch. Industriel*, contains the following paragraph signed O. K. L. I experimented with steel, and wished to obtain on it a light blue. Pure lead melts at 315° C., and the same degree of temperature is necessary to anneal steel to light blue. I melted the lead, raising the heat a few degrees beyond fusion, and having ground the steel white, immersed it in the lead, and after having immersed the steel in it for a few moments, withdrew it and had a handsome light blue color. To keep the lead from oxydizing, fuse it under cover of powdered charcoal and soda or potash.

A similar method can be applied for annealing steel yellow, (at 230°C.) by substituting zinc for lead. It must be remarked, however, that the flame must be extinguished as soon as the metal has fused, a continued exposure to the heat would raise the temperature.

SCIENCE NOTES.

Dramatic scene painters in Europe have about as fair an idea of things in general in this country as the average European journalist. One of the scenes in a highly popular spectacular play performed in Paris is the Brooklyn bridge. The bridge looks over three feet wide and 600 feet high. Several scores of ships in full sail are moving briskly under it. Palm trees grow on either shore and Indians sit on picturesque rocks around the Brooklyn entrance. At the New York end of the bridge is the capitol at Washington.

A steam buggy is under construction in Augusta, Ga. The machine will be about the size of an ordinary buggy, with two wheels behind and but one in front. The machinery will be located in front, also water and gasoline tanks. The boilers are heated by two gasoline burners. The front wheel is extra large, and will bear the entire weight of the machinery. The rear of the machine will be the same as an ordinary buggy, with ample room for several persons. Its average speed is estimated a mile in three minutes. The speed of the first horse that gets his eye on it has not yet been computed.

Among the companies recently formed in Paris is a society for the utilization of solar heat, with a capital of 1,600,000 francs. The invention consists of a huge reflector not unlike an inverted umbrella, the interior of which is lined with a high reflecting agent. In the centre of this, and occupying the position of the umbrella stick, is a standard boiler made of a material highly conductive of heat. This receives the rays from the whole reflector and thus collects sufficient heat to generate steam. In addition to motors the society supplies domestic sun machines which boil water, prepare tea and coffee, grill chops and steaks, fry eggs, and cook other food. Portable machines are made for carrying on horseback which will boil water and serve a dinner on short notice. The company also supplies scientific machines and even furnishes the same power in the shape of a children's toy.

Saved by Josh Billings.—Josh Billings tells the following story of one of his own experiences:—"A few days ago I was driving in New York, and had got just alongside the Metropolitan hotel when a man with a satchel and duster hailed me. He said he wanted to talk to me a moment, and so I drove around on a side street, and we stood and talked.

"'Now,' said the man, 'six years ago I was going down to my lawyer's office, in the town where I lived, to sign some papers transferring a matter of $10,000. Suddenly something of yours that I had seen in a paper came into my head. I stopped short, thought a minute, went on to the office, and had the papers burned up, and did something entirely different from what I had intended. I saved by that $6,000. Now I don't know anything about how you are fixed, but if money is any object to you, if there is anything you want, I am ready to divide with you. What will you take?'

"I took a drink. We stepped into the Metropolitan bar, and, after a little claret and ice, I asked the man what saying of mine it was that he had saved his money on. He said it was something like this:—'Never take the bull by the horns, but take him by the tail, because then you can let go when you want to.'

"'Yes,' said the stranger. 'I concluded it was just as well to take him by the tail. I could hold on just as well, I could steer him just as well, and let go when I please.'"

Editorial.

"THE AUCTION SALES HUMBUG."

The readers of THE TRADER are doubtless aware by this time of our opinions upon all kinds of illegitimate and underhand trading, whether practised by wholesale or retailers. We have repeatedly written up the discount sales humbug and warned the trade that by such practices they were simply forging a weapon for their own destruction. There is, however, a newer and more dangerous phase of humbuggery extant at present, which we have denominated as above "The Auction Sales Humbug." We can understand a jeweler selling off his stock by auction for the purpose of going out of business, and we can even understand the necessity that sometimes arises for such stocks to be occasionally sold by the sheriff or the trustees of a bankrupt estate, but we must say that for retail dealers to periodically make a practice of selling off their goods by auction, is not only something new in the way of doing business, but something which if persevered in must have a strong tendency toward demoralizing the trade wherever it is practised. Regarding a *bona fide* auction sale we have nothing to say, further than that as a rule the goods are usually sold at prices which net a loss upon the retail dealer's cost for the stock. This of course is expected, and no dealer in his sober senses, therefore, would ever think of offering regular staple goods for sale in this way. Experience has proved time and again that it don't pay. In addition to this it has a tendency to upset regular trade. Start an auction sale of a large regular jewelry stock in any city, and see what the effect will be. Any dealer will tell you that it unsettles people from buying in the regular way, as most of them imagine they can get wonderful bargains by going to the auction room. This kind of trade is hard on regular dealers, although as a rule the general public are benefitted by getting bargains.

So much for regular legitimate bankrupt stock auctions. Now for the periodical sales that we have referred to. We say without fear of honest contradiction, that these auction sales are a delusion and a snare, and that for one person who gets value for his money twenty get fleeced. Does any sensible person ever think that it can pay a retail merchant to hire an auctioneer at large wages, turn his shop upside down and demoralize his regular business in order to sell goods at a loss. Everybody knows that on such goods as are usually sold by jewelers, auction sales are bound to net a loss to the seller. How then are these losses made up? We unhesitatingly answer, by watering the stock and offering a gullible public, trash instead of reliable goods. Any person attending these sales who is a judge of goods will at once see that nine-tenths of the goods offered are only shams, and are really sold on false pretenses. These sales generally take place at night, and are usually patronized by a class of verdants who imagine that all is gold that glitters, and that because the seller has fine goods to sell at regular prices in the usual way, that therefore every article put up at his auction must be of the same quality. At the present time there are a couple, if not more, of these periodical auction sales going on in Toronto, and if one can judge from the letters of complaint that are published in the daily papers, some of the victims are beginning to realize that things are not always what they seem.

We consider this kind of business neither legitimate nor honorable, and we might add honest without violating our ideas of propriety. The persons who auction may think it a clever stroke of policy, and it may even succeed for a while, but we greatly fear thatin the long the consequences must be very demoralizing to the regular trade. We like honest, straightforward competition, but we have no sympathy with such trade as this, which violates every principle of business and verges so closely on the dishonest.

STAND AND DELIVER.

An impression seems to have gone abroad in Ontario that in Manitoba an insolvent may legally assign his estate to a Trustee for the sole benefit of those creditors who agree to sign his discharge. A more absurd and illogical idea we never heard tell of, and we are astonished at any persons putting it forward in sober earnest. If this were so, and an estate only paid a dividend of five cents on the dollar, the creditors would either have to take this and give the insolvent a clear discharge, or else lose their share of the estate altogether. This may be law, but it is hardly common sense. When an insolvent assigns, common sense says that he does so for the benefit of the whole of his creditors, and not for the few that may elect to give him a discharge. We always were under the impression that an insolvent got his discharge as an act of grace from his creditors, but according to some Manitoba would-be authorities, the insolvents up there have the right to take their creditors, metaphorically, by the throat, and virtually say, "If you don't give me my discharge you won't get a solitary cent of my estate."

As we said before, this certainly is not common sense whether it be law or not, and we are now glad to be able to say definitely that such an iniquitous thing is neither law nor common sense. We are informed by some of the best legal authorities in Manitoba that a creditor cannot legally assign his estate in this way, and that every creditor has the right to his pro-rata dividend, and may please himself as to whether he signs the insolvent's discharge or not. This is as it should be, and the sooner insolvents in the prairie province get over the impression that they are in a position to legally bulldose their creditors into one-sided settlements favorable to themselves, the better for the credit of that part of the dominion.

DEFECTIVE VISION.—In the course of a lecture at Berne by Prof. Pfluger, he stated that in some schools in Germany 70 and 80 per cent. of the scholars were suffering from defective vision, while in the Heidelberg gymnasium the percentage was 100—that is, every lad in the school was afflicted with bad eyesight.

LORD COLRIDGE'S VISIT TO CANADA.

Lord Colridge's visit to Canada did not come off, but, perhaps like Punch's grandmother, "it's coming to come." Of course, as loyal citizens of "Her most gracious Majesty," the people of Canada feel very much cut about it, although we hardly think they will go into mourning. As a matter of fact, Lord Colridge, like any other British citizen who visits America in a private capacity, has a perfect right to come to Canada or stay away just as he pleases, and its nobody's business that we know of except his own. If he can deny himself the pleasure of seeing the British portion of North America and noting the prosperity of his fellow-sub ects in this Greater Britain, the loss we think is not ours, and we can stand it if he can. But there is a phase of this affair that we wish to touch upon, and viewed from our stand point as British subjects, Lord Colridge is no more to blame than many another prominent Englishman who has visited America during the past few years.

As a rule, prominent Englishmen visiting America usually take one of the fast ocean steamers and land at New York. There they are wined and dined until they begin to be of the opinion that the citizens of the American Republic are the most liberal and whole-souled people on earth. From thence they are passed on to Washington, Chicago, Cincinatti, St. Louis, and perhaps may get as far as San Francisco. During their trip they usually manage to visit that wonder of nature, the falls of Niagara, and this is the only time during their visit that they are reminded by a glimpse of the Union Jack floating in the breeze, that all of this vast country does not belong to the United States. These prominent Englishmen ignore the fact that just across the mighty Niagara there is a British colony, whose people are as truly loyal to the monarchy as their own, and who own the largest and probably the finest half of the North American continent. They forget that these people, although numbering scarcely five millions, have not only resisted the political encroachments of the fifty millions south of them, but have on more than one occasion freely poured out their life's blood to maintain its integrity. They forget that in Canada the civil and religious institutions that our British forefathers bled and died for in the old land are here conserved by the descendants of these patriots, who are surely but unostentatiously building upon this side of the Atlantic a British Empire, which in the near future is bound to be greater in extent and influence than parent state from which it sprang. Most of them as soon as they reach England rush at once into print and astonish their less venturesome countrymen with their impressions of the wonderful American Republic, the vastness of its resources and the freedom and capabilities of its people. "Our Kin across the Sea" is a fruitful theme for such people, and they apparently never tire of giving the shrewd Americans the best possible return for their far-seeing hospitality by acting as the very best kind of free advertising mediums.

The question that has always arisen in our mind is, are these Englishmen acting a loyal part in ignoring their fellow-subjects in Canada and praising up the United States? Our impression is that they are neither loyal to the British Islands nor to the British Empire. True, these men do not directly influence British emigrants to go to the United States in preference to Canada, but in. directly they do. Canada they ignore and the United States is painted in such roseate colors, that the masses who seldom stop to think naturally conclude that the Republic is the best place for them. During the past fifty years Great Britain has parted with millions of her people in the shape of emigrants, and the greater portion of them have made their homes in a foreign country, the United States. It is computed that every emigrant is worth at least five hundred dollars a year to the country in which he settles, and at this rate figures would almost fail to shew the wealth that England has poured into the lap of the United States. These emigrants have helped materially in the development of the country, they have filled her workshops, built her railways, dug her canals, brought her timber land under cultivation, and caused her waste places to blossom like the rose. In short, they have materially contributed to make the country what it is at present, one of the greatest in the world.

But is it not singular that British prescience has not been able to see that while all this might be well enough in sentiment as a matter of fact, they have with their own people been building up one of the greatest rivals to their own commercial supremacy that they now have to contend against. Britain's greatest commercial rival is the United States, and that she is so is largely due to the fact that her resources have been developed by British citizens. But it is not all a question of commercial supremacy. Great Britain and the United States have gone to war in times past, and will probably do so again before the world ends, and in that event these ex-English subjects would not only have to give of their substance to carry on such a war, but might be conscripted and forced to fight against their native country. We trust that such a war may never happen in our day, but it may come, and if it does it would place many a British subject now residing in the United States in an awkward predicament.

Now did it ever strike the average English statesman that it would be a far more patriotic policy, to say anything of its wisdom, to encourage emigration to their own colonies by every means in their power in preference to emigration to a foreign country such as the United States certainly is. Of course, as loyal Canadians, we would like to see them all come to Canada, but we are not selfish enough to want or expect such a thing. We think, however, that the government and the press of England should do all that lies in their power to induce them to go to some British colony, no matter whether it be to Canada, Australia, New Zealand or the Cape, so long as it is a British colony. If this could be carried out emigration would mean to England simply a transfer of her subjects from one part of the Empire to another, instead of at present, loss and increased opposition.

It strikes us that it is just as important for England to strengthen her colonies as to strengthen herself. Every additional man they gain in population, and every dollar they gain in wealth makes the Empire stronger and better able to resist outside pressure.

From a commercial standpoint, we think that it would be a great advantage to England to have her emigrants settle in her colonies, which are better customers to her in proportion to their population than the United States or any other foreign nation can ever be.

Of course the government of England cannot force emigrants to go where they

don't wish to go, but both they and the press of England could exert a mighty power in influencing their choice of a home. Further than this, if prominent Englishmen would take the trouble when visiting America, to spend a little time in seeing Canada as well as the States, they would not only be astonished at the wonderful resources and development of the Dominion, but would be in a position to appreciate the vastness of the Empire of which it forms a part such as they never before possessed.

Selected Matter.

GENERAL JACK'S DIAMOND.

Pretty much everybody has heard of General Jack's penchant for diamonds, and a great many of us know the man himself, a sturdy character, sound and firm on his feet as a horse-block. A florid face, rather hard, a square chin, determined lips closing over white teeth, cold gray eyes looking right at you from under a hedge of eyebrows sandy in color, dusted with gray, a large straight nose, broad and fleshy—you've seen the man. Dressy in his way, but not as gentlemen dress, and wearing rings upon his fat white fingers, and a big diamond in his expansive shirt-front. His voice is deep and stern, rather hoarse, too, and harsh; its volume is tremendous when it comes freighted with a crash of oaths. General Jack is self-made; began as driver of a pair of mules on a canal route, then took the lion-car of Herr Broscher's menagerie, became finally ring-master to a circus, owner of his own circus, keeper of a livery stable, millionaire, art patron, political leader. His wife was on the stage once, and a charming creature she is; and General Jack is universally known and liked by the profession—but it is about General Jack's diamond we are going to tell you.

"First thing I ever bought," says General Jack, "when I got to be ring master, after I was properly fitted out in the clothes department, was a diamond, and I've been buying 'em ever since. Its a weakness, and I've paid for it. Tiffany's people always send for me when they got in anything new, and the Amsterdammers know me."

It is said that those who want to come it over General Jack—no easy thing to do—always approach him on his diamond side. He takes it as a compliment to be asked to show his collection, and does show it. But he is a good judge of character for all. The story goes that some thieves conspired to rob him by profiting by his pleasure in showing his treasures. There were three of them—nobby English fellows—who came over expressly to do the job, and thoroughly posted. They made his acquaintance at a down-town hotel where he is often to be found, and in due course procured the invitation to see his diamonds. They claimed to be sporting men, ardent turfites, but connoisseurs in such things. They came to Jack's house one forenoon, in a coach, and he received them kindly, opened his safe, displayed all his treasures, and went into their history. "This," he said, "is my Golconda specimen—not very large, but remarkable for its brilliancy and pure water. This is my Brazilian, a trifle off color, a suspicion of a canary tinge—" whack! says Jack, "You would, would you?" and with three successive blows of his fat white fist, his three English visitors were knocked down and put *hors de combat*. It was a mere suspicion on his part—something he saw in the men's faces, read it in their eyes—but it saved his diamonds. He summoned aid, locked the safe, secured the men, and found them fully armed—pistols, burglar tools, handcuffs, rope, gag, chloroform, red pepper. He disarmed them, bundled them into the coach, and gave them twenty-four hours to leave the country. "As you came here on my invitation, I won't *cache* you, but—git!" And he still preserves the gag, the handcuffs and the Cayenne among his trophies.

One day General Jack had a visitor, a man of forty years, with grizzled hair and a stoop in his shoulders—a pallid face, somewhat bloated from long indulgence in liquors. "You don't know me, General Jack!" said the man.

The General was puzzled a good deal. "Hombre, I've seen you somewhere. Stop—I have it! Good Lord, Cary, what have you done to yourself!"

"It's fifteen years ago, General," said Cary, apologetically.

"Only fifteen! Zounds! You were a handsome young fellow then; I thought you were a genius. And your wife was lovely."

"Don't mention the past—she's a wreck, six children to care for; and I am—what you see. I want you to do something for me, before the black dog devours me."

"Hombre, it's the drink that does it."

"I want you to save me from the drink, General."

"This man," (the General says, when he tells the story)—"this man, Mark Cary, was what you might truly call one of these here geniuses. When I knowed him—and loved him, too, as everybody had to do—he editing a neat little paper in a Virginia town and happy as a June bug. One of your Apolloses—tall, square, a step like a spring board, blue eyes full of fire, Hyperean curls like—a man, every inch. The things he couldn't do with the dumb-bells weren't worth trying—he could beat my best man at the square leap—sat a horse like a Center or a Comanchy—and put a pen in his hand, or call on him for a speech, and, by zounds, you couldn't mate him nowhere. I used to get him to write my bills and advertisements for me—he'd been a treasure in that line if he'd only take wages. As for poetry—well, I'm no judge, but if he couldn't pump all these here centenniallers, I'm Dutch! His wife was just the sweetest little lady ever you see, and could pour out tea like an angel. And now here he was, gone to seed.

"How came it, Cary?"

It was the war, poverty, sickness, long struggles in adversity, long lassitude and loss of spirits, chagrin, all that turned in.

"I think I'm gone, General, but Margaret won't hear a word of it. She told me to come to see you and ask you to help me."

"Where is the little woman, Mark?"

He named a wretched tenement-house. General Jack drummed on the table with his fat fingers a moment. "Not in want, I hope, Cary?" said he at last.

"Not quite, General; but the times are hard, I can't get away, and there's no telling how long it will be before that comes, too."

"Come, let's go and see her," said the General, and Cary, without a word, led the way to his poor lodgings.

The General does not say much about the interview that ensued, but I know from other sources that the wife and children had a good supper that night.

"Come to my office—down-town, here's the number—to-morrow at 11, Mark,

and I'll talk with you. Madam, I'll see you again," and the General withdrew.

"See here, Mark," said the General next day, "you're broke down. The little woman can't do anything with you, and your own backbone's turned into injan rubber. You ain't worth a d—n!"

"That is the conclusion that I was coming to myself, General," said Cary, with pathetic sincerity.

"I know better!" cried Jack, vehemently pounding the table with his fist; "I mean to take you in hand now, and make a man of you!"

"I wish to heaven you would!" cried Cary.

"I mean to! You're the very fellow I've been looking for this year and more. You're honest and capable—you know all about geology, minerology and that sort of thing, don't you?—if you don't you can learn—stop! Listen! You are up to my diamond passion—well, there's where I want you! I want a man—an honest man—a capable man—to go to South Africa for me, and find me the biggest diamond there—a dozen of them, if you're so minded! Will you go? Stop! I'll take care of the little woman if you do, and provide for her if you don't come back. The sea voyage will give a chance to taper off, drop the drink, build yourself up and all that; when you get there you'll be all right again, and then you can use your brains in finding me that diamond. I'll pay you good wages, and all you find is mine. Is it a bargain? Strike hands on it if it is!"

"If Margaret says yes, I'll go, General. And God bless you anyhow!"

"Come home to lunch with me then, and we'll ask her—she'll likely be there."

Not only she, but all the children were there, and in the newest of clothes, for Mr. Jack had been at work too, and Mrs. Cary told her husband, with tears in her eyes, "We need'nt go back to that dream of horror any more."

So it was all settled in a few minutes. Cary's family were to have the cottage on the General's farm and an ample allowance, the eldest boy and girl to go to school, and Cary himself to go after the big diamond. In a week Mark Cary sailed, with a chest full of books in which to study up the subject, and the little woman and her children were happy on the farm—happy, at least, as they could be with Cary away in quest of the big diamond.

How did that quest fare? I must let General Jack tell it in his own way, as he takes the key of his safe from his pocket, preparatory to opening, and stands on the hearth before the grate, warming his stout calves, and emphasizing his narrative with gestures of the key.

"Never was mistaken in a man in all my life, before that! Made all my money by looking in people's faces to see if I could trust 'em or no. And this here Mark Cary—well there's half a million o' diamonds, great and small, in this here chist, let alone bonds, and I'd left him here with the safe open and nobody else in the house, and gone off say to Europe or the Sandwich Islands perfectly easy. But, you see—well, there's such a thing perhaps as tempting people too far. Cary got along splendid at first. He wrote to his wife and me regular all along the voyage, and when he got to the Cape he sent a photograph that we might see how he was spruced up. I could see the old curls was coming back to his hair, and the old fire to his eyes, the old roundness to his cheek—and the little woman was more in love with him that ever. He went up country, and by and by his letters begin to come regular again, and diamonds, too—small ones, but one or two good-sized ones, so that in their sum they might be taken to be worth full as much money as I had put up for him. One day he sends me a real brilliant two-karat fellow and simultaneous draws on me for £500, saying he was going to another place in the hope to find a diamond worth the venture.

"After that no more from Mark Cary. More than a year went by, and not a word did I get from him, nor did his wife no more than me. The little woman was well nigh crazy, and, as I had no good news for her, I didn't tell her any. I had written in a private way to a correspondent of mine at Natal, and heard what I was afraid of—that Cary had gone to the bad again—and it cut me deep; but I never let on, not even to my own wife. No news—eighteen months and more went by, and not a single word from Cary. I kept out of the little woman's way all I could, for the sight of her would have distressed a politician, let alone a stone wall; but one stormy night she burst in upon my wife and me, as wild as she could be. 'General Jack,' she says, wringing her hands, but never shedding a tear, and turning on me a face I could'nt look at for the pity of it; 'General Jack, I cannot be the pensioner of your bounty any longer! You are the best man that ever lived and I'm the most wretched of women, but that's no reason why I should keep on imposing upon you.' So I says to her, 'What's up?' for I was pretty sure now she had news of Mark, and nothing good. 'Have you heard from Cary?' 'General Jack,' she says solemn like, 'I know my husband is dead! I know that he has been false to you, and it killed him! It's killing me!' I was struck all of a heap. 'Never mind, little woman, never mind!' I was going on to say, when my wife broke in, 'How did you learn all this, Margaret?' she asked. 'In a dream, a dreadful, awful dream!' said the poor creature, and then she broke down, burst out crying, and couldn't say any more. So we sets to work to console her best way we could, but didn't make much headway at it. I told her I would be cruelly hurt if she didn't let me keep my promise to Mark, but her last word was she couldn't, daresn't and wouldn't live on me.

"Just then the front-door bell rang, and when William opened it, the raggedest buzzard of a man broke past him and came rushing into the sitting-room here where we were. He hadn't a whole stitch nor a clean stitch on him, that fellow hadn't; his hair was long and wild and his beard also; his feet bare and his face would have won the premium over a Connecticut hatchet for sharpness. All the same, that little woman knowed him as soon as he stopped at the door, turned white as a sheet, held her two hands together tight, and just sighed between her teeth, 'Mark!' I thought she'd go over, but she was too true grit for that. He never noticed her, nor nothing else. He came straight up to me, and kind o' steadied his staggering feet by holding on to the table and looked me in the face and said, cool and calm like, 'General Jack, I've been a thief and a traitor, a sot and a vagabond, for more than a year; but I have lived long enough to make you amends. Here's your diamond; take it quickly, for I'm dying!' and he put a bundle of rags about as big as your two fists in my hand, and went over just like he was shot.

"The little woman gave one cry,

half joy, half terror, and had him in her arms next instant, his head in her lap and she smothering him with kisses, while my wife, cool as a statue, turns to William and says, Have some soup made, and the first thing I saw she had the brandy bottle and a spoon and was down on her knees beside him. 'He's just starved to death, General, that's all,' says she. And I wasn't nowhere in that ring, while them women were bringing him around with little doses of beef tea and brandy, kisses and pattings, and calling him all the loving names in the dictionary. By and by he sits up—'Where is it?' says he, and makes me hand that parcel of old rags out of my pocket where I'd slipt it in the hurry of the moment, and unwrap and unwrap until out there shined—but sho! there are some things you cannot describe!"

And at this point in his narrative the General always unlocks his safe and produces his great diamond. "There he is! Biggest diamond in America! Finest jewel in the world! Look at it! That man fetched him for me all the way from Africa by way of Australia, and hadn't a cent in his pocket half the time! Didn't I tell you I never was mistaken in a man's character in my life? Hadn't had a bite to eat from Omaha here, but held unto the diamond and said nothing—only starved!

"Well, he told me all about it—not that I believe all his sentimental trash, though. People with his sort of face are honest because it's their nature. If they get wrong their nature beats and kicks them and pulls their ears till it sets them right again! That's all of it. His story was that he hadn't been at the new place more than a week before he lighted on the big diamond—kicked it up with his toe. He no sooner saw it than he knew it was a fortune for him if he kept it. Then, he says, the devil entered into him and tempted him, and he got on an all-fired rollicking bust, and run away to India to sell the stone to a rich Maharajah there. But, just as he was concluding the bargain he ran away again—he don't say the devil tempted him this time, though. Then he landed in Australia, and kept up his jollification until he hadn't a red left; but all this time he held on to the diamond, because it was mine, not his. So one day he makes up his mind to come home, and works his passage across to California, and then, for fear lest he should be tempted again, or get robbed, begs and borrows his way home. Now, that I call pretty much of a temptation for a poor man to overcome; don't you? Look at the stone—it's worth $80,000 as it's cut, and that Mark Cary didn't know he was going to get a penny for it, outside his wages, as agreed on. But he brought her on, all safe! It isn't every man would do it—but the way I got rich was by looking in men's faces and seeing if they're honest. And I never was wrong in judging a man's character in my life."

General Jack will not tell you, what is nevertheless the fact, that, after his famous diamond was cut, he had it appraised, and paid Mark Carey its value, less the advances made to him and his family. He will not tell you of Cary's fine plantation and his fine prospects—of how he is a temperate man, a good citizen, and the best of fathers and husbands—made so by General Jack's ministry. But he will show you the big diamond, if you call upon him, with exquisite pleasure, and relate to you with much gusto such portions of its history as do not reflect too great credit upon himself.—*Exchange.*

A STROLL THROUGH THE HOROLOGICAL SCHOOL AT GLASSHUTTE.

Impelled by curiosity, and time hanging heavily on my hands, I concluded to pay a short visit to the Horological School at Glasshutte; having seen it formerly in a picture, I had formed an indistinct idea of its natural beauties, position, facility, etc., but I must say that the reality agreeably excelled any preconceived ideas. The building is separated from the main street by a handsome fence, with a large gate, through which I entered, mounted the wide doorsteps, and entered through the open hall. I do not know why, but a cold shudder stole over me when I made the first step over the threshold of this edifice erected to art and science. The hall is handsomely painted. Four large pillars carry a cross vaulting; a glass wall separates the hall from the inner staircase.

The janitor appeared, summoned by my ringing, and upon request, conducted me to the director of the school, Dr. Lindemann. I expressed my desire to examine the school, and the gentlemen very kindly permitted me to be present at the theoretical instruction, the same forenoon. I listened to the lectures of Mr. Strasser, in the theoretical branches of arithmetic, geometry, and book-keeping, and was really struck at the high degree of excellence attained by the pupils.

I returned in the afternoon at 1½ o'clock, to hear the lectures delivered by Messrs. Hesse and Bergter, both eminently practical teachers. Mr. Hesse was calling the roll, done morning and evening. I intended to at once examine the tools, but found that the discipline of the school demands every scholar to clean up his bench, and carefully pack away his tools into a box under the bench. On consideration, I found it to be a laudable rule, because the scholars might suddenly be prevented from visiting the school next day, and by their being laid away and locked up, they are prevented from getting dusty, and being used by his co-apprentices; beside, it teaches the young men order. Every watchmaker knows that the use of many tools is sometimes necessary during the day, and if heaped upon the bench, a long search is often necessary to find it. "A place for everything and everything in its place."

Leisurely I could witness the several works in progress. The school counts over forty scholars, divided into three large rooms, and each scholar was occupied with that work best suited his capacity. But the imprint of the school was plainly visible upon everything.

Two more hours of instruction were given in the evening, from 5 to 7 o'clock, bearing on theoretical horology and French, under tuition of Director Lindemann, and I, an old watchmaker, must confess that I was perfectly charmed with the amount of instruction imparted in the former.

Desiring to see the tools, etc., and a week day offering very little opportunity for such inspection, I solicited the Director for permission to call to morrow (Sunday), which he kindly granted me, and next day he exhibited to me all the constructions, contrivances, tools, and utensils in use; everything I saw was thoroughly practical and adapted to its purpose.

During instruction and school hours, the rooms within are locked, and no one

can enter or depart without the intervention of the janitor.

The ground floor to the right contains the theoretical schoolroom, with five benches and an experimenting table; on the wall in front of the benches is suspended a large blackboard. Close to this schoolroom is the library, being also the conference room of the Directors. The kitchen, also, is located on the ground floor, as well as the janitor's room.

Descending to the basement, the first thing that strikes our attention is a pump by which good drinking water is forced up under the roof, where it empties into a reservoir. From there it is distributed over the building. An electric apparatus indicates when the reservoir is nearly empty or full.

The basement also contains the battery room, containing a large number of elements, for the propulsion of the different electric clocks and bells of the building. The most interesting, however, is the so-called pendulum room, with double walls, doors, valting, and floor; everything is laid in cement. The room is intended to retain even temperature, and as soon as it is thoroughly dry, will receive an electric seconds pendulum, which at present oscillates in the Director's room.

Four very practically constructed working rooms are situated in the first story, and are very amply provided with light and air; in the middle room is the Director's room, whence doors and windows lead to the right and left. The working benches are of beech, and built very substantially. Every scholar has one meter length of bench, a large tool box, and a seat suitable for him, to enable him to sit straight while at work. Eight places are separated for scholars who desire to work standing. The Director told me that they are always taken up. Every room contains all the latest and improved machinery, universal lathes, cutters and rounders, drilling machines, etc., and the requisite foot fly wheels for their propulsion, as also those for smaller turning tools, are all fastened to the ceiling, and thus they do not occupy valuable floor space. Electrical index clocks are distributed through the entire building, and a bell, which, of course, rings for the beginning and end of the school hours.

The Director's room contains two standard clocks, also the aforementioned pendulum. A telephone connects the school with the house of the Superintendent, Mr. Moritz Grossmann.

The garret contains the dwellings of Messrs. Lindemann and Hesse, also several rooms for scholars. The aforesaid water reservoir is situated immediately under the roof, as well as three electric fire alarms, and the room for a large public electric index room, not yet located for want of funds.

Expressing my thanks to the Director and teachers for their exceeding affability, I left this institution of learning, the German Horological School, with feelings akin to regret, silently hoping that horologists would issue thence, who, with the profundity of their thoughts, would be a credit to the establishment and an honor to the craft, and soon afterward bade adieu to the charming little mountain town of Glasshutte.—*Z., in Allg. Journ d. Uhrm.*

THE CARE OF FILES.

A new file should never be used for steel; it is best to employ it for some time at first on brass, taking care not to use it too roughly. If employed for steel at once, or if sharp quick strokes are applied, the cutting edges of the file will chip off, and the hard particles will be embedded in the metal operated upon; the work will thus be bad, and the file itself deteriorated. A file that has been carefully used, and has passed gradually from brass to steel, will last four or five times as long, and will always work well.

Watchmakers often fix files into handles by driving them firmly into round holes in the handles; this practice frequently leads to their being cracked, and the following method is preferable:

Take an old worn out file or a piece of iron of the same form as the tail of the file to be fitted; heat it several times to bright redness and drive it, when so heated, into the handle, taking care to maintain it perpendicular. A hole will thus be formed of the required form, in which the file will hold without their being any occasion to apply excessive force in fixing it in position.

When the surface of a file is choked with particles of iron, copper, wood, etc, while the cutting edges are yet good, it can be cleaned as follows: Place the file for a few seconds in a hot lyre of potash in water, and on withdrawal, dry it before the fire and brush the surface with a stiff brush.

To renew the cutting edges of files, either of the following methods can be adopted:

1. First clean the file with potash or soda dissolved in water if greasy or resinous substances have to be removed with hydrochloric acid if it is rusty; and by rubbing with a metallic brush or piece of coke if particles of iron, brass, copper or tin have to be removed. The file is now immersed in a mixture of 1 part nitric acid, 3 parts sulphuric acid, and 7 parts water.

As the action of the acids become less energetic owing to the combination with iron, the temperature of the mixture must be raised, since rapidity is a condition of success. The time during which the file should remain in this bath varies from 10 seconds to 100 and more, the roughening of fine-cut files being far more immerse in lime wash, dry, and then cover them with a mixture of oil and turpentine by means of a brush, after which they are ready for use.

2. After being cleaned, as explained above, the file is supported in a dish full of water, resting on two cross wires, so that all its surface is in contact with the liquid. Now add strong nitric acid in the proportion of 1 part to 8 of the water, mix it thoroughly, and allow it to remain for 25 minutes. Remove the file, and, after washing in water and rubbing with a hard brush, place it again in the bath, to which a second eighth part of acid is now added, and leave it for fifty minutes. Again remove and brush the file, add a sixteenth part of concentrated sulphuric acid, and replace the file in the bath. Then wash successively in pure water and in lime wash (to remove the last traces of acid) and dry. The file will be found to possess both the qualities and the appearance of a new one.

Beaupuy files and burnishers.—Most watchmakers are acquainted with the files and burnishers that M. Beaupuy has introduced for rapidly forming conical pivots, the main characteristic of which is that the corner presented to the pivot is rounded to the desired form and roughed; they do their work rapidly and well, but some skill is necessary in their management. To the instructions which accompany them we must add the following:

They must never be used when quite

THE

JAMES BOSS GOLD WATCH CASE,

is the best protection for the Movement that has ever been put on the market.

IT IS STRONGER, STIFFER, MORE COMPACT, AND CLOSER FITTING

than any other, and is the only case containing a

DUST BAND.

This dust band encircles the inside of the case in such a manner as to

Prevent any Dust or Dirt

FROM WORKING INTO THE MOVEMENT,

and is the greatest improvement ever adapted to

Watch Cases.

In Finish and Ornamentation the Jas. Boss Case is unapproached. They are sold by all Canadian Wholesale houses.

The Canadian trade will remember that this case is recognized by the Jewelers of the U. S. as the standard, and is the only Filled case that has given entire satisfaction through all time.

new on a pivot that is to be employed in a watch; it will be reduced too rapidly. The freshness must be worn off the cutting edges of the teeth by preliminary use.

The pressure must only be applied perpendicularly to the surface of the staff as in making a square-shouldered pivot; the file is held against the flat face without pressure. A lateral force will have the effect of straining the pivot and causing it to break.

The corner of the shoulder must not be brought to correspond with the required point in the notch of the Jacot tool until the entire pivot is nearly of the requisite size. Up to this point the pivot should not pass into the notch for more than three-quarters of its length. It is of course understood that, before using these files, the cone must be shaped as far as possible to correspond with the corner of the file. When only a few strokes of the file remain to be given, it should rest on the entire length of the pivot.—*Ex.*

A CLOSE SHAVE.

"During my stay in Aberdeen I took occasion to visit the barracks and have a talk with some of the members of the Gordon Highlanders who were quartered there. One of them, Sgt. Monroe, struck me as being a particularly good specimen of the British soldier, and noticing that he wore upon his breast the English and Egyptian war medals, I made his acquaintance, and drew from him an account of his adventurous career. The Sergeant had seen active service in India, Ashantee, Afghan, and last of all in Egypt, and had of course had some very narrow shaves from being killed. He apparently bore a charmed life, for though he could show scars from assigis, lance, bullets and sword cut, he was apparently as strong and vigorous as he had ever been in his life. "My narrowest escape," said he, "was at Tel-el-Kiber. As you know, we stormed Arabi Bey's entrenchments at daybreak, and that the Highlanders and the Irish did the bulk of the fighting. Well, no sooner was the signal to 'Charge' sounded than up the embankment we rushed like so many devils. From the top we poured in one volley and then went into them with the bayonet. They couldn't stand cold steel, and we slaughtered them there in the outer defense works like so many sheep. Then they broke and ran, and as they scrambled over the second line of earthworks, we went with them pell mell and kept up the fight hot and heavy on the other side. I was a little ahead of my company, and my blood being up I was doing my level best to knock as many of them out of time as I could. I had polished off two and was going for the third when he suddenly turned and faced me, and being joined at that instant by a couple of his comrades, they went for me. Finding it was do or die, I rushed at them and killed the foremost one by a bayonet thrust clear through the chest. As he fell I made a thrust for the second, but he was too quick for me and caught my bayonet with his hand and in a moment I had dropped my rifle and we were struggling like two bull-dogs for dear life. A glance showed me that the third fellow had his rifle ready but could not fire at me for fear of hitting his comrade. My old boxing experience now stood me in good stead and I soon let my opponent have a blow behind the ear, which quieted him. As I was getting on my feet however, the third chap fired at me almost point blank and shot me fair in the breast, knocking me over. I was on my feet in a moment, but before I could help myself he was on me with his bayonet. A moment more and I would have been in Kingdom Come, but Geordie McKenzie here rushed in at that instant and ran him through. As you know, the actual time of fighting was short, probably it was not over ten minutes after the first rush that the whole thing was over. When I came to examine my wound I found to my astonishment that the Egyptian soldier's bullet had hit fair on my watch and thus saved my life. The watch shewed a dent on the outer case, but the works were all right and have kept as good time as ever. It's the greatest curiosity I have, and I'd not part with it for anything." Sgt. Monroe subsequently let me see the watch, which plainly showed the dent of the bullet on the back, but being good and heavy, the dome ins de and the works were both uninjured. The watch looked like a fine gold one, but the Sergeant said it was one of those American Boss' patent gold cases that are now being sold in this country. I offered him a ten pound note for it, but although it probably didn't cost him much over the half of that sum, he refused to part with it at any price. It certainly was a narrow escape, and I don't wonder that Sgt. Monroe refuses to part with the proof of it. The Gordon Highlanders are a splendid body of men, and I shall long remember my visit to their quarters with a great deal of pleasure.—"*Hotspur*," *in the London Chronicle.*

AFGHAN MONEY.

Let me now describe the process through which the English rupees at present pass to bring them out from the Kabul mint in the shape of Kabuleese rupees. In one of the rude sheds which I have described as running round the court-yard, are two rows of small round clay hearths, elevated an inch or two above the floor, and depressed, like a plate, in the middle. A pile of rupees—generally 300—having been counted and weighed, is placed upon one of these hearths in a carefully prepared bed of ashes, and covered over with charcoal and wood. The charcoal is then lighted, and when well aglow four pounds of lead for every 300 rupees is added to the furnace. The lead, in combination with the bone ashes, separates, as is well known, the alloy. This first process converts the rupees into a dull, unsightly mass of silver, free or nearly so, from alloy. The pure silver thus extracted is then carried to another shed, carefully weighed, and an amount of English rupees equal to its weight added to it. Rupees and silver are then melted together in a crucible, and the melted mixture is ladled by hand into molds, which give it the shape of flattened bars about 12 inches long. These bars are then taken to a third shed, to be annealed by hammering, and given the form of slender, round rods. The next process is that of drawing these rods through a plate of iron, perforated with round holes to give them a uniform circumference. This is done by means of a rude hand-wheel, after which the rods are cut by hammer and chisel into the lengths requisite to form the future rupee, each of which lengths is carefully weighed in a pair of scales. Any that are too heavy are handed to a workman whose business is to slice off a fragment with his chisel; any that, on the contrary, are too light are handed to another workman, who notches the little cylinder by a blow of his chisel, and inserts the required fragments into the notch. cylinders are next carried to a fifth shed, and, after gently heating, are hammered into small round disks, which have a yellowish-white color. To remove this color and give them brightness they are next plunged into a caldron of boiling water, in which they are boiled for some time along with apricot fruit and salt. This process imparts brightness to the dull disk of silver, and they are then ready for the last process they have to go through, that of stampiug. This is, perhaps, the most interesting part of the operation. Two operators sit facing one another, half naked, on the ground, with a little iron anvil between them. into the face of the anvil is inserted a steel stamp, destined to give the impression which the underside of the rupee will bear. One operator places the little silver disks with great quickness and accuracy upon the stamp, and the other, who is armed with a heavy hammer in his right hand, and a steel stamp bearing the inscription destined for the upper side of the rupee in his left, with one heavy, well-directed blow, impresses the device on the soft lump of silver. Lastly, each rupee thus stamped is again weighed, and deficiencies iu weight made up by the same rude process as noted at another stage of the work, the ameuded rupee passing once more under the hand of the stampers. Such is the simple process by which money is now being coiued in Kabul. It certainly makes one stare by its very simplicity, and the absence of all secrecy, fuss, or show ; aud yet it is perfectly effective, and the money turned out, though rough and unfinished, is excellent in quality, if inartistic in shape and appearance. It needs hardly to be said that the rupees coined as I have described, contain only half the quantity of alloy which the English rupee does. I shall only add that the establishment, as now constituted, can turn out 25,000 rupees per day, and is capable of an extension.—*Letter to London Times.*

ROTHSCHILD'S COSTLY GOBLET.

Baron Charles de Rothschild, of Frankfort, has recently purchased, for the enormous sum of 800,000 fraucs ($160,000), a silver gilt cup by the celebrated Jamitzer, which is said to be a marvellous work of art. This sum, according to the *Chronique des Arts*, is, as far as it is known, the largest price ever made in modern times for a single object of art. The work is the centre piece of a table service. The foot is composed of a rock entirely covered with grasses and field flowers, on which disport themselves beetles, little lizards, locusts, and snails.

From this arises the figure of a woman, emblematizing the earth and bending in eloquent pose as she supports on her head and her hands a tall chalice, decorated by grotesques and topped by a cover, which terminates in a vase in form of a baluster, from which springs a bunch of leaves and flowers. The silver gilt of which the cup is made has ornaments in opaque and translucent enamels. The gold smithery of the sixteenth century is said to offer nothing more finished in execution, and which, though open to criticism, possibly from the standpoints both of taste and style, has its weaknesses, counterbalanced by the wonderful perfection of all its details.

The story of Baron Rothschild's acquisition of the work is quite curious. It formed part of the estate of the late Nuremberg banker, Merkel, who died in 1873, and whose heirs by common accord agreed to loan it, together with Albert Murer's portrait of Holchurcher, to the German museum of Nuremberg, of which Jamitzer's chef d'œuvre became one of the greatest treasures. Indeed the public, during the years it was on exhibition, thought it belonged to the museum. It was so arranged that the work could not be taken away without joiut consent of the heirs and a ministerial authorization.

Some months ago the celebrated art work disappeared from the galleries, to the great astonishment and consternation of the Nurembergers aud the country in general. After a while it leaked out that a Frankfort deater in art objects, the agent of Baron Rothschild, had appeared with the necessary papers from the family and the minister, and the director of the museum had been obliged to deliver to him the cup. The whole affair was conducted with great secrecy, and it is certain that, had it been known that it was possible to purchase this artistic treasure there would have been many bidders, and the art loving baron would have been obliged to pay a larger sum or see some rival purchaser carry off the coveted prize.—*Jewelers' Journal.*

BUSINESS CHANGES FOR OCTOBER.

S. Oberndarffer, jeweler, Kingston, Ont., sold out his stock by auction. R. R. Reid, jewelry, Winnipeg, Man., out of business. W. H. Davy, jeweler, Chatham, failed, and business closed up. Wm. Rolff, hardware, Windsor, Ont., dead. John Woltz, jeweler, Winnipeg, stock sold by sheriff. A. Beaudry, jeweler, Montreal, sold out. J. P. Chilton, jeweler, Ottawa, closed up. D. Bolduc & Co., jewelers, Quebec, assigned. R. Witson, hardware, Brandon, Man., sold out to T. G. Harrison. Quigley Bros. hardware, Brandon, stock sold by their creditors.

BUSINESS NOTES.

In regard to the Woltz (Winnipeg) forgery case, we understand that that part of the matter has been settled. The stock, however, has been sold by the sheriff and the business closed up.

G. N. Coffrin, a jeweler of Thornbury, Ont., has just been sold out by the sheriff. Coffrin has for some time past been doing an impecunious kind of trade, and it is probably as well that an end was so summarily put to his business career.

"How Do You Do?"—We were favored last week with a visit from our old friend, Mr. Hills, of the American Watch Co. Mr. Hills reports business with his company as being first-class,and the demand constantly increasing.

Contradiction.—It having been reported through Canada by interested parties that the "Lancaster Watch Co." had failed, we have been requested to state that this is not the case, but that the company are now financially stronger than ever before and are still turning out goods as usual.

Improvement.—We note by an exchange that Mr. A. F. Milliken, the well-known jeweler of Cornwall, Ont., has just erected an extensive addition to his establishment, which is now one of the handsomest and most complete in Ontario. Mr. Milliken is a pushing, energetic and courteous merchant, and thoroughly merits the business success he has achieved.

More Diamonds.—We understand that Wm. P. Sawyer, the hotel clerk who fleeced several of our city jewelers so badly, got ahead of several more whose names did not appear in the papers at the time. Of course they are all keeping dark about it, but if by any chance Sawyer should be made to disgorge, further developments as to those swindled may be looked for.

W. H. Davy, jeweler, of Chatham, has again come to grief. Cause, overtrading and bad debts. J. B. Kelly, dry-goods merchant, of the same place, who has been assisting him, and who got a chattel mortgage to secure his claim, has taken possession of the business, and as there is not enough assets to satisfy his mortgage, the indications are that the rest of the creditors may as well write their claims off their books at once.

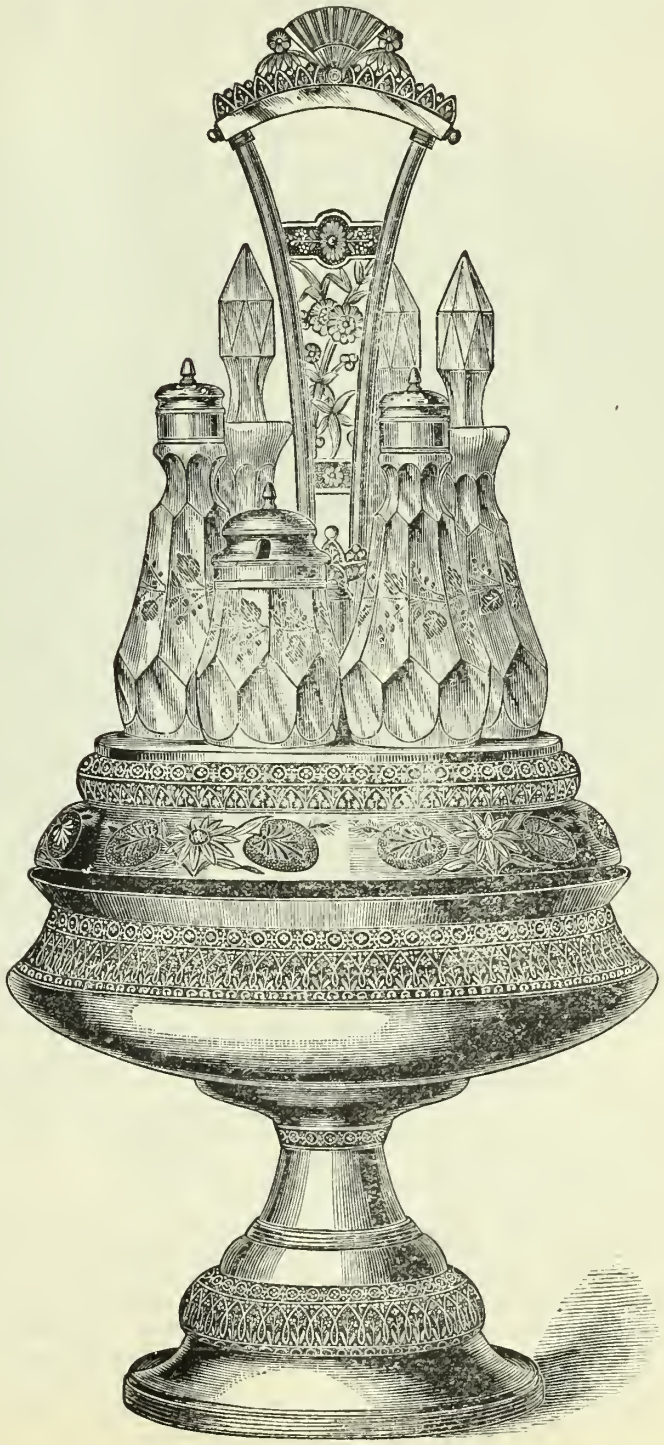
Correction.—In our last issue we copied a note from the Toronto *Mail* in regard to the display of "The Toronto Silver Plate Co." at

SIMPSON, HALL, MILLER & CO.,

WALLINGFORD, CONN.

—MANUFACTURERS OF—

Artistic and Useful Hollow Ware,



ELECTRO PLATED UPON FINE HARD WHITE METAL.

There is nothing in Designing, Ornamentation or Manufacturing which our artists and workmen cannot produce.

Forty Staple and Fancy Pieces

in each Pattern in Geneva, St. James, Countess, Windsor, Oval Thread, etc. Made under the supervision, and quality guaranteed, and controlled by Wm. Rogers, formerly of Hartford and Meriden. (Wm. Rogers, Sr., died 1873.)

WM. ROGERS,
Wallingford, Conn.

No connection with any concern in Waterbury, Meriden or Hartford, using name of Rogers in any form.

FACTORIES: WALLINGFORD, CONN., U.S. AND MONTREAL, CANADA.

the Industrial Exhibition. The article in question stated "That where twelve men were employed a year ago, thirty men were now engaged in the different branches." The manager of the company, Mr. J. A. Watts, has called our attention to the fact that this is a mistake, and that they have now over one hundred men on their pay roll. We have pleasure in making the correction.

A Safe Bank.—We noticed on the corner of King and Yonge streets the other day what appeared to be a small-sized dwelling house on wheels. Enquiry elicited the fact that it was not a bullet-proof house intended for shipment to Ireland for landlords' use and warranted bullet proof, but one of Messrs. J. & J. Taylor's steel linings for the inside of the Dominion Bank Vault. The bank has shown sound sense, we think, in lining their vault with steel, and should, when finished, inscribe over the door the legend "Bring on your Burglars."

Foiled.—A jeweler named E. Rosseau, who kept a small store in London East, and "left" suddenly, was arrested in Detroit last month, on the complaint of Robert McGill. The latter keeps a jewelry store in that city, and charges that Rosseau gained his confidence by negotiations to buy his business. In order to learn what amount of trade was being done, Rosseau was permitted the freedom of the store and allowed to wait on customers. McGill missed a number of watches left to be repaired, and suspecting Rosseau, caused his arrest. Rosseau waived examination and is held for trial.

Another Dissatisfied Competitor.—The position of judge at one of our exhibitions is never a particularly happy one at best, but it becomes doubly embarrassing when every competitor is bound to have the first prize. We notice in one of the London papers that Mr. F. T. Trebilcock, jeweler, of London, sent a jewelry exhibit to the Western Fair, which did not take the first prize. Mr. Trebilcock feels aggrieved at this, and is out with a $1,000 challenge to the winner of the first prize, claiming that one of the judges was a tinsmith, one a dealer in crockery and the other a foundryman, and all of them utterly ignorant of the jewelry business. Without expressing any opinion whatever as to the merit of the award, we may say that we very much doubt whether Mr. Trebilcock's challenge will result in anything more than a cheap advertisement for himself.

An Honest Farmer.—A very funny story has been going the rounds of the press of this country, to the effect that a farmer somewhere near Ogdensburg sometime ago shot a pigeon and found attached to its leg a quill containing several diamonds of the very finest quality. The farmer was not only honest enough not to keep them, but sagacious enough to take them straight to the collector of customs at Ogdensburg, who of course smelt a very big mouse in the affair. Special detectives were put on the track of these pigeons, and finally, after weeks of watching and waiting, the dove cote was found, but alas, the smugglers had flown. Now all this is good enough for a dime novel, but as far as it is practically concerned it's nonsense. Who would ever think of risking valuable diamonds in this way when, without the slightest trouble or risk they could be carried over the border in one's pocket. The thing is absurd, and we don't think anyone who had money enough to pay for diamonds of any kind would ever risk them in this way. Fancy people smuggling diamonds by the use of carrier pigeons when bulky and almost valueless stuff are smuggled over in quantities every day of the year.

In our last issue we published a note from the *Coaticook Observer* in reference to a seizure of jewelry at that place, belonging to the firm of J. H. Jones & Co., of Montreal. The impression made upon our mind from the article copied was that the goods were seized while Mr. Jones was *en route* from New York to Montreal. Had this been the case the seizure would have been proper, and the goods would probably have been confiscated. We are informed, however, that the goods seized were simply those carried around the country by the firm's travellers in the ordinary course of business, and was done at the instigation of interested parties, more as a matter of spite in order to cause the firm inconvenience, than with any idea that the goods had been smuggled and could be really confiscated. Messrs. Jones & Co. are credited with having given the eastern customs authorities a good many points regarding the smuggling of jewelry by opponents in business, and it is thought that some of those inconvenienced by the information, resorted to the expedient above referred to as one means of getting even with them. We think that Messrs. Jones & Co. are to be commended for doing all they can to stamp out smuggling, and when they have got it thoroughly eradicated in Montreal they might turn their attention to Toronto.

WORKSHOP NOTES.

Aluminum Silver.—The following alloy is said to receive a high lustre and polish: Copper, 70 parts; nickel, 23; aluminum, 7.

Gold Tinge to Silver.—A bright gold tinge may be given to silver by steeping it for a suitable length of time in a weak solution of sulphuric acid and water, strongly impregnated with iron rust.

To Write in Silver.—Mix 1 ounce of the finest pewter or block tin and 2 ounces of murcury together till both become fluid, then grind it with gum water, and write with it. The writing will then look as if done with silver.

Magic Polish for Brass.—Add to sulphuric acid half its bulk of bichromate of potash; dilute with an equal weight of water, and apply well to brass; rinse it well immediately in water, wipe dry, and polish with pulverized rotten stone.

To Tighten a Canon Pinion.—The canon pinion is sometimes too loose upon the centre arbor. Grasp the arbor tightly with a pair of cutting nippers, and by a single turn of the nippers around the arbor cut or raise a small thread thereon.

Timing French Clocks.—Scape wheels of French clocks make two revolutions per minute, or four vibrations to each tooth. They may be quickly brought to time by counting if the beats of pendulum per minute equal four times the number in the scape wheel.

To Solder German Silver.—Dissolve granulated zinc in spirits of salt in an earthen vessel. Cleanse the part to be soldered, and apply the spirits of salts. Next put a piece of pewter solded on the joint and apply the blowpipe to it. Melt German silver 1 part, and zinc in thin sheets 4 parts, then powder it for solder.

Silver Assay by Smelting.—If no lead is present, mix 600 grains of the pulverized ore with 300 grains carbonate of soda, 600 grains of litharge and 12 grains of charcoal in a crucible; add a slight pinch of borax over all, put on the furnace, melt, take off, give it a few taps to settle the metal, let it cool, and remove the bottom.

Pickle for Frosting.—Silver goods may be frosted and whitened by preparing a pickle of sulphuric acid 1 drachm, water 4 ounces; heat it and immerse the silver articles until frosted as desired; then wash off clean, and dry with a soft linen cloth, or in fine clean sawdust. For whitening only, a smaller quantity of acid may be employed.

Alabaster Cement.—1. Finely powder plaster of Paris made into a paste with water. 2. Melt rosin, or equal parts of yellow rosin and beeswax, then stir in half as much powdered plaster of Paris. The first is used to join and fit together pieces of alabaster or marble, or to mend broken plaster figures. The second is to join alabaster, marble and other similar substances that will bear heating.

Regulating the Balance.—To reduce an exactly equipoised compensation balance to preserve uniform time in horizontal as well as vertical position, it is necessary to equalize the pivot friction to its smallest possible quantity. It is also necessary to see that the jewel holes be not unduly thick, that they are truly round and well polished. If this is not the case, they are to be corrected to correspond with these requirements, or else replaced by suitable ones.

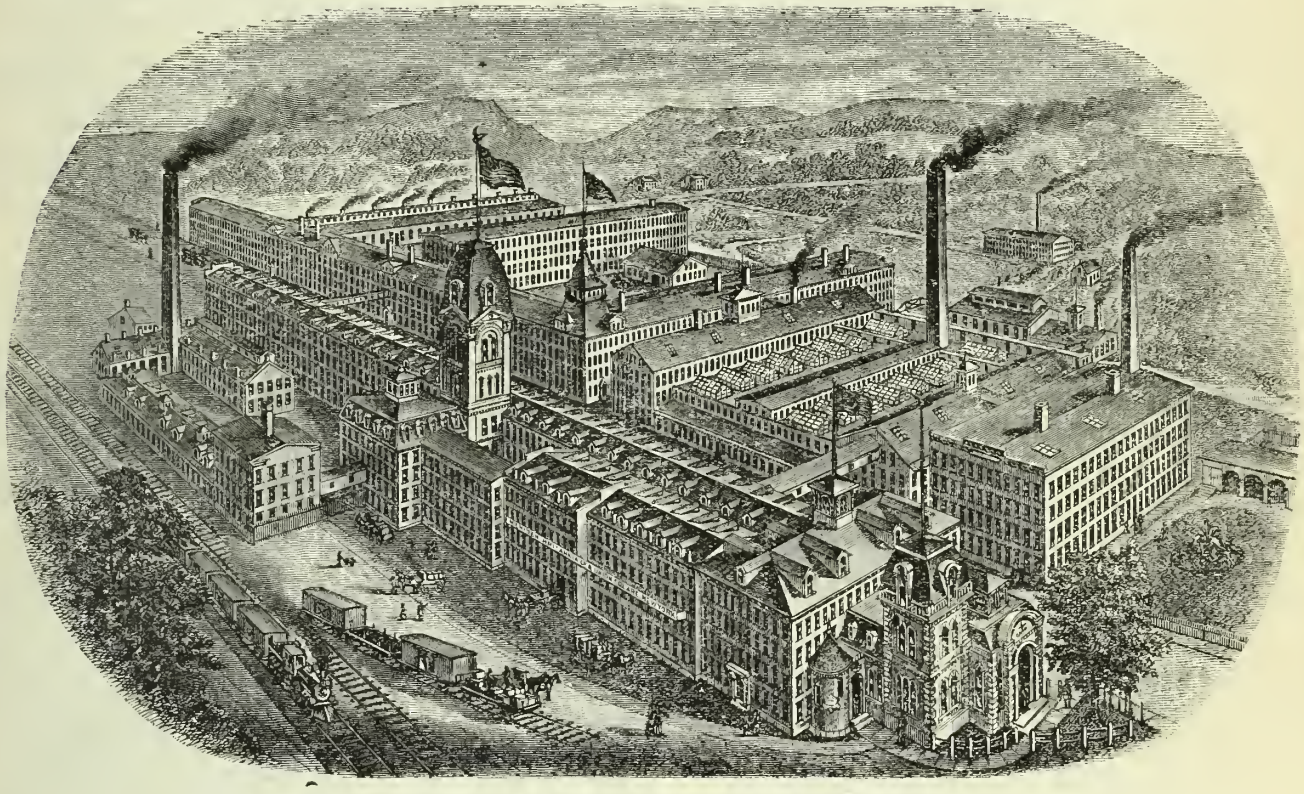
To Make Burnishers.—Proceed the same as in making pivot files, with the exception that you are to use fine flour of emery, on a slip of oiled brass or copper, instead of the emery paper. Burnishers which have become too smooth may be improved vastly with the flour of emery as above, without drawing the temper. To prepare one for polishing, melt a little beeswax on the face of your burnisher. Its effect then on brass or other fine metals will be equal to the best buff. A small burnisher prepared in this way is the very thing with which to polish up watch wheels. Rest them on a piece of pith while polishing.

OTHER NOTES.

The Desert Sahara.—M. de Lesseps, in a recent lecture on the feasibility of filling the Desert of Sahara with water from the Red Sea, said that the evaporating power of the sun is less there than in the Red Sea, and he does not anticipate that the water will dry up. The cost of the necessary works has now been estimated at 150 000,000 frances, and the time required at five years. All the projectors require is the concession of the lands which will form the shores of the lake.

Highest Honors Awarded at the Toronto Exhibition, 1882

TWO SILVER MEDALS AND A GOLD MEDAL!



Meriden Britannia Co.

MANUFACTURERS OF STANDARD

ELECTRO, SILVER AND GOLD PLATE.

TRADE

1847, Rogers Bros., A 1,

OR

1847, Rogers Bros., XII

MARK.

OBSERVE

this Trade Mark is stamped on all Knives, Forks, Spoons and other flat ware of our manufacture.

The A 1 Goods are Standard Heavy Plate, and XII signifies that in addition the articles have an extra quantity of Silver on all the parts most exposed to wear.

The Meriden Britannia Company have been awarded the highest premiums wherever exhibited, from the WORLD'S FAIR, 1863, to the PRESENT TIME, and the high reputation of our Goods throughout the world has induced other makers to imitate our Trade Marks and name as well as our designs, and as many of our patrons have, through a similarity of names, purchased inferior goods under the impression that they were our manufacture, we are compelled to ask especial attention to our Trade Marks.

THE FACT THAT OUR NAME AND TRADE MARKS ARE BEING SO CLOSELY IMITATED SHOULD BE A SUFFICIENT GUARANTEE TO THE PUBLIC THAT OUR WARES ARE THE BEST IN THE WORLD.

WE RE-PLATE OLD WORK AND MAKE IT EQUAL TO NEW.

GOLD IN AUSTRALIA.—The production of gold in Australia seems to have diminished considerably since 1875, when the mines yielded 1,068,418 ounces. In 1876 the quantity sank below one million ounces, or, in exact figures, 963,760 ounces. In 1877 the figure fell to 809,653 ounces; in 1878 to 758,040 ounces, while in 1879 it slightly rose to 758,947 ounces. The year 1880 continued to show a slight improvement, for the yield rose to 839,121 ounces, and 1881 ended with 858,146 ounces.

NEW PROCESS FOR SILVERING MIRRORS.—Prof. Palmieri, it is said, has devised a process for silvering glass by means of the reducing action of glycerine on the salts of silver, which is said to have the advantage of producing a very brilliant metallic deposit. When into an ammoniacal solution of silver is poured, first, a little caustic potash, and then a few drops of glycerine, the reduction begins at once; and this action is accelerated if ether or alcohol be added to the mixture. A moderate heat and darkness are said to increase the brilliancy of the precipitate, and darkness also favors the adherson of the deposit to the mirror.

NEW THEORY FOR DIAMONDS.—M. Berthelot, in the *Journal de Pharmacie et Chimie* for March states that from peculiar physical relations he is led to suspect that the true element carbon is unknown, and that diamond and graphite are substances of a different order. Elementary carbon ought to be gaseous at the ordinary temperature, and the various kinds of carbon which occur in nature are in reality polymerized products of the true element carbon. It is thought that spectrum analysis confirms this view; and it is supposed the second spectrum seen in a Geissler tube belongs to gaseous carbon. This spectrum, which has been recognized along with that of hydrogen in the light of the tails of comets, indicates a carbide, probably acetylene.

MICA MASKS AND SPECTACLES.—Herr Raphael, of Breslau, has patented mica masks and spectacles in Germany. One special merit is their great lightness. By a subsequent improvement it is possible for any workman to insert a new piece of mica in the spectacle frame when required, the piece costing only about three cents. The frame may thus be used for a long time. The workman gets quite accustomed to these spectacles after a day's use. Herr Raphael further provides gray and blue mica glasses, which are quite transparent, and the color of which is fire-proof. They are very pleasant for workmen at large fires, as they prevent strain of the eye. Masks for half of the face weigh only 40 grams (less than 1½ ounces). Herr Raphael also supplies masks to cover the whole face, and, if necessary, also the neck.

EXCELLENT PROVISION.—There is in Germany a society for the welfare of youth on leaving school, and this, along with another society, has recently announced a prize competition having for its subject, "The Choice of an Industrial Calling." The prize is about $375. Competing memoirs must be confined to the manual occupations and small industries, and should deal with the following questions: What are the peculiarities of such industries (indicating briefly the kind of work involved in various manual occupations)? 2. What bodily and mental capabilities are assumed on the part of the apprentice? 3. What ways are open to an all-round qualification for the particular industry, and what means hereto are required? 4. What material prospects are offered by the industry, and, especially, what prospects of future independence?

MODERN ORDNANCE.—Gunmaking is almost at a standstill in the Government factories at Woolwich, and orders are anxiously awaited to make up for lost time. The transition of the national armament from muzzle-loading to breech-loading is still supending new operations and arresting new enterprises, and scarcely a large gun has been made or a heavy coil turned out for five or six months past. The introduction of steel, although only in the experimental stages, has quite supplanted wrought-iron bars, and the rolling and coiling mills are consequently almost closed. The gun factories are, however, busy, owing to the additional labour involved in constructing the fittings for the breech-loading appliances, which require great ingenuity and nicety of construction, and the character of the handicraft which at the present time distinguishes the department has not been equalled since breechloaders went out of fashion twenty years ago. The cost of the new guns must necessarily increase with the amount of skill which they involve, and the newer guns which are coming, built up of solid castings, must also lead to a heavy cost in comparison with the cheap system of gun-building, which is evidently to be suspended at an early date. Very large guns of steel are, however, remote probabilities, as the national factories can cast only eleven tons of steel at one casting, and much more than that will be required for guns of the monster type which appear to be called for by the strength of modern armour. The relative advantages of steel hoops and wrought-iron coils may, however, be regarded as decided in favor of the former, for, though the coils possess ductility and elasticity in a superior degree, the numerous joints are an indispensable weakness, from which the solid steel, with all the faults inherent to every mere casting is free. Trials have been made for combining the two systems by making coils of steel, but they are understood to be the reverse of encouraging.

SPICKERMAN'S

PATENT CEMENT CHUCK!

The best Chuck in the world for centering all kinds of watch wheels. Does not heat or color wheels. Can be used by any workman and at a price within the reach of all.

Editorial.

WARNING.

In our "Trade Notes" this month we are sorry to have to chronicle two of the most daring and successful jewelry robberies that have ever taken place in Canada. Mr. G. L. Darling, of Simcoe, and Mr. James Trotter, of Galt, are both jewelers of the very highest standing, and carried large stocks of fine goods, which, although confined in fire proof safes, were not sufficiently protected against the skillful scoundrels who burglarized their premises almost under the noses of the watchmen employed to look after them. These two burglaries following so closely upon each other, prove that we have in our midst at the present time a regularly organized gang of scoundrels, not only skillful enough to laugh at the protection afforded by an ordinary fire proof safe, but daring enough to hazard their liberty and even their lives to make a haul whenever they can find things to their liking. As most of our readers well know, nearly all the safes used in Canada by jewelers are simply the ordinary fire-proof safes. They are good as far as they go, but the trouble is they don't go far enough. They were never intended to withstand the operations of a skillful burglar and are not so guaranteed by the makers. If all of our jewelers were possessed of real fire and burglar proof safes, such as are made by J. & J. Taylor, of this city, they might sleep soundly and let these scourges of society do their worst, but the trouble is that not one jeweler in a hundred has a safe that can by any stretch of imagination be considered burglar proof. If they could afford it we should certainly advise every one of our readers who has a valuable stock of goods to invest in a real burglar proof safe; this, however, is beyond the means of most, and we therefore throw out a few hints regarding the protection of premises and stocks of this kind, that may be of value to some who have never before given this matter serious thought.

In the first place we think every jeweler should place his safe as close to the street window as possible, and have it in such a position that any passer by can see it plainly and tell at a glance if anything is wrong about it.

Secondly, a strong, clear light should always be left burning close to it every night. This will enable the watchman outside, or any passer by, to see it as easily as in the daytime. If there are any two things that disagree with burglars they are light and publicity. A good strong light in a store at night is about as good a watchman as you can get.

Thirdly, unless you can afford to employ a regular watchman, a good sharp dog is no mean substitute for one. Burglars don't like dogs, especially those that have a habit of putting their teeth into trespassers. Even if they should not be biters, a dog that will make a lot of noise and raise an alarm is not well considered by them.

The above are very simple, and, we think, very effective, and we are of the opinion that it was owing in some measure to the lack of such simple precautionary measures as these, that the two burglaries which we have to report this month were made possible. THE TRADER warned its readers about this very thing over two years ago, and we now repeat the warning in the hope that it may be of benefit to some of our readers.

In connection with this subject a few words on the improved methods of operation pursued by our modern burglars may not be out of place, as it may help to convince our readers that the danger of which we warn them is more real than perhaps they are disposed to believe.

"During the past few years the art of burglary has made rapid strides, keeping pace with the march of science. Evidence which has been ferreted out through Pinkerton's detective agency shows that the latest scientific aids have been used in the burglar's art. According to the new method safes are opened with greater celerity than heretofore, and the artists work so noiselessly that a person in the adjoining room will hardly be disturbed. The use of powder is dispensed with, and there is hardly any safe so obstinate that it will not yield its contents to experts who handle the new tools in less than half an hour.

A safe recently gone through exhibited evidences of very masterly and peculiar skill in the burglarious art. It had been opened by boring a half inch hole between the combination and the handle. After boring the hole a thread had been cut in it, and an instrument had been inserted that forced off the wards of the lock, and, breaking it in two, forced it into the inside of the safe. This plan of forcing in the lock is something novel in burglary. It may be called the pushing system, in contradistinction to the pulling system.

By the new system upwards of fifty jewelry safes have been opened in the States during the past few months, in most of which the thieves have got off with hauls ranging in value from $2,000 to $15,000. Chas. H. Mayhon and John Moore, two notorious burglars, were recently captured in New York, and at their lodgings were found a couple of sets of the new tools which are so handy and so light that they can be carried with ease in the pocket, each set not weighing above three pounds. In fact the thieves have termed the set of tools, "the pocket edition." At the lodgings of the man Mayhon was also found complete machinery for making these new tools along with the portion of the door of a safe covered with very hard steel for the purpose of proving the drills and other instruments. It is just probable that a branch of the gang who formerly operated in New England is now working Canada, and with these new appliances. This appears more likely from the fact that Pinkerton has information showing that a number of burglarious experts have made their way northward."

COMMON SENSE BUSINESS.

We have had put into our hands a circular purporting to emanate from a London (Ont.) retail jeweler, which is not only unique in its grammatical construction and general get-up, but characterized by a display of egotism that fortunately very few merchants care about displaying to the public. Apart altogether from the numerous misstatements with which this circular abounds, we notice the writer has apparently endeavored to impress the public of London with three things: (1) That he is the *only* man in London, and we should think in Canada, who is a thorough, practical

watchmaker and can do a good job; (2) that he is the only honest watchmaker in London; (3) that he will sell goods to the public as low as any other dealer in London can buy them.

In reference to the first proposition, we are not in a position to dispute his claim to being the best or only good watchmaker in the city he lives in. True, we have heard some people who ought to be posted about his abilities as a workman give him a poor name, but this has probably been the result of envy more than anything else. We would remark for his benefit, however, that as a rule "self praise is no commendation," and that were he as good a workman as he claims to be, and lived as long in the same city in the same business as he has done, that his merits as a mechanic would be so generally recognized that he would have no need to sound his own praises in the self-satisfied way he does, neither would he be compelled to cut on regular trade prices fifty per cent. in order to keep his mighty energies employed. A good watchmaker, who does first-class work, can always get all he can do at regular trade prices, no matter what his opposition may be, and our experience is that it is only the third-rate workman who has to slaughter prices. We should think, and we imagine the public naturally think the same way, that a watchmaker is generally the best judge of his own value, and if he considers his own work only worth half the regular price, that is sure to be about its real value.

In regard to his being the only honest dealer, and having the only honest goods in London, this is an inference to which we must decidedly take exception. Our acquaintance with the London jewelry trade has extended over a period of nearly twenty years, and as a class we have always regarded them as upright and honorable, and we fail to see why we should at this late day change our opinion; certainly the perusal of so bitter an attack as is contained in this circular would have no effect in altering our opinion. This phase of the circular reminds us very much of the English traveler's description of the Chinese city of Shanghai, whose streets abound with such signs as the following: "*No cheating here; don't deal with the man across the street, he is a cheat, but come to me and get the only genuine rat's meat at cost price.*" The public are always justly suspicious of a person who is constantly declaiming about his own honesty, and this feeling of distrust is intensified when to this evidence of bad taste is added the worse one of running down everybody else who may be in opposition.

In regard to the third declaration that he sells his goods at other dealers' cost, we are more concerned than in any of his other statements. If this is as he claims, then it argues a smaller amount of business capacity than we had expected from a general perusal of the circular. It may be that the writer of the circular is a man of independent means and sells goods simply for the public benefit. If so he has got into a a trade that will tax his energies to the utmost, and at the same time give him little or no thanks for it. The public generally believe that but few, if any, merchants do business for the pure love of it. As a rule merchants do business to make money, and the public expect to pay them a reasonable profit for their work.

If this gentleman is not, as we suspect, a person of independent means, then certainly he is pursuing a very "dog-in-the-manger" policy by doing business in the way he proposes. Every business man of experience knows that it takes a certain percentage of profit to run any business, and if that profit is cut down too low, the balance sheet will show a loss instead of a profit. From the figures this gentleman gives in his circular, we should venture the prediction that his business will not show a profit at the year's end, and that it is only a question of time when he has to advance his prices or go under. His whole attempt looks to us as though he was unable to make money himself in business, and was unwilling to let anyone else make any. The jewelry business is peculiarly one of confidence and good will, and if the public have confidence in a merchant in this line, he can get a reasonable profit on his goods and still retain their confidence and trade. People don't buy jewelry because they know whether it is cheap or dear, but simply because they want it, and even if every retail jeweler in London were to sell at cost, as our friend professes to do, it would make no perceptible difference in the amount sold. We can see no good whatever in such a suicidal course as this, for it simply demoralizes the trade without doing the person practicing it any good.

Did time and space permit we might write much more fully concerning this production, which is calculated to do harm both to himself and the trade in the city of London and vicinity. We have no personal knowledge of the writer, but we certainly think that if he honestly intends to run his business upon the lines laid down in his circular, the sooner he gets out of the jewelry business and gets an appointment as manager of some charitable institution, the better for himself and all concerned.

STANDARD TIME.

The change in the system of counting time which came into operation on all the railroads in North America on the 19th of November, is a real step forward in the direction of a universal system of time keeping. As probably all of our readers know, the idea is simply to divide the North American continent, for time purposes, into five belts, each belt being fifteen degrees wide. Within the limit of each belt one standard time is to rule, and between each two adjoining belts there is a "jump" of an hour, that is that the time of each belt is exactly one hour slower than the belt east and one hour faster than the belt west of it. While this may seem strange at first, a little reflection will convince almost any one that the change is a practical one, and well adapted for the travelling public, while to those who never go away from home, after the first day it won't really make any difference. Any one who travels much will certainly appreciate it, for instead of never having to correct local time, or having to alter his watch in every place in order to get it, his watch, once set right, will be exactly right anywhere in Canada or the United States between the confines of the belt for which it is set. Then again should he happen to go east or west sufficiently far to go into other belts, how much easier to compute the correct time by adding or subtracting an even hour for each belt, instead of, as formerly, adding or subtracting a certain number of minutes or seconds which varied with every mile travelled. The thickly settled part of Canada will at present be comprised in three belts. The maritime provinces and the eastern part of Quebec in the Eastern; the western half of Quebec and Ontario in the Centre, and Manitoba in the Western. The time in the maritime provinces will then be an

hour faster, and that in Manitoba an hour slower than Ontario time. The centre belt practically extends from Quebec to Sarnia, and the following alterations may be interesting as showing the difference between the local and standard time at some of the principal points, and how they will have to alter it in order to make it correspond :

			Minutes.
Quebec puts the clock back about			15
Montreal	"	"	6
Ottawa	"	forward	3
Kingston	"	"	7
Toronto	"	"	17½
Hamilton	"	"	19
London	"	"	24

As this new time has already been adopted by all the principal places we would advise our friends in the jewelry trade everywhere to conform to it as quickly as possible. If not they will find their local time about the "meanest" time possible, especially if they ever have to do any travelling. By all means get the new standard time and keep to it.

Selected Matter.

THE QUEEN'S PRESENT TO CAPTAIN SHAW, OF THE LONDON FIRE BRIGADE.

Her Majesty the Queen has recently presented Captain Shaw with a bracket, or table clock. The case is of black marble, about fourteen inches high, square-sided in shape, standing upon four golden balls, and having a Corinthian pillar upon each side of the dial, which latter is black with gold figures. The surmounting of the case is very appropriate, and tells its own story. There is a helmet of gold resting within the line, formed by a beautiful-executed bronze imitation of the fireman's belt and hatchet. This may be called the crowning of the design, and most harmoniously in keeping with the character of the gift it appears. The movement is that of a French pendule clock, striking the hours and half-hours upon a spiral gong-wire. Underneath is the following inscription upon a golden plate: "Presented to Captain Eyre M. Shaw, C.B., Superintendent of the Metropolitan Fire Brigade, by Victoria R.I."

The R. I. signifies Regina Imperatrix; that is, Queen and Empress. A large number of ladies and gentlemen have, by the courteous permission of Captain Shaw, inspected the handsome present, and given utterance to their admiration in very gratifying terms. It is rather difficult to say who has the right to be the best pleased at the incident, Her Majesty, or Captain Shaw. The first-named on account of the kindly expressions and loyal feelings which it has called forth towards herself; or the latter at the distinguished, social honour and heir-loom which has been conferred upon him. I will slightly paraphrase a line of Byron about Moore, the poet, and fitly apply it to the happy recipient here :—

"He won it well, and may he wear it long."

" C. Stuart, in the
"Jeweler and Silversmith."

THE SIDEREAL DAY.

ASTRONOMICAL AND SOLAR TIME—WHY THE STANDARD IS ADOPTED.

The following memorandum, which will at this juncture interest some of our readers, has been furnished by Mr. S. E. Roberts :—

"Time is a measured portion of infinite duration." A measured portion between the immeasurable past and future. For measuring this portion we may adopt any standard we please. It has been found most convenient to use the time of the rotation of the earth on its axis as the standard of reference in all cases. Let a telescope be pointed to a star, and then clamped in position, and the time noted when the star crosses a wire in the centre of the field; the interval occupied by the earth rotating upon its axis, before the same star again crosses the wire, is called a sidereal day, and is divided into twenty-four hours. This is the astronomical standard. For civil purposes it is more convenient to use solar time. But the sun is not a fixed point in the heavens; he travels round the entire circle of 360 degrees in 365 days, or very nearly one degree in every day, and as one degree is equal to four months, it will take the earth four minutes to overtake the sun after it has passed the star in sidereal time. This is known as apparent solar time. But, from causes which I must not now stop to explain, the motion of the sun is not uniform. The elements of the irregularity have been grouped together, and tables prepared which are known as "the equation of time." The time given by these tables is sometimes added to and sometimes taken from apparent solar time, and we then get the "mean solar time," by which one day is regulated. A meridian may be defined as an imaginary line passing through both celestial poles, the zenith and the nadir; the plane of this great circle must therefore pass through the observer's place and the earth's centre. From this it is manifest that every place on the earth must have its own meridian, and it is noon by apparent solar time when the sun crosses the medium of that place. The earth rotates from west to east, and consequently the meridian of Montreal will pass beneath the sun about half an hour earlier than the meridian of Toronto, while places west of Toronto will be later in the same proportion. Hence we have been accustomed to speak of "Montreal time," "Toronto" and "Chicago time."

THE NEW STANDARD TIME

simply proposes to adopt the mean solar time of the 75th meridian for general use in all places lying between 67½ degrees and 82½ degrees of west longitude, and thus avoid the confusion arising from the use of the meridian lines of different places. The central meridian of this district, *i. e.*, the 75th, crosses the St. Lawrence a few miles west of Cornwall, and passes northward east of Ottawa. On this line the new standard will make no change; to the east of this line noon will be given a little earlier, and west of the line later than the general local time.

It will make almost no sensible difference to our social life, while it will greatly facilitate our movements in travelling and in many other ways.

AN ELECTRIC WATCH.

The St. Petersburg correspondent of the *Jewish Chronicle* writes :—A Jewish young man, nineteen years old, named Salomon Schisgal, and coming from Berditschew, a Jewish centre in Southern Russia, has for some time been the hero of the day in this city. In commercial circles and in journals of every shade of opinion, the current topic is the genius of Herr Schisgal, who in outward appearance is a mere youth, and no words are sufficient to praise his invention, for which he has already received a patent from Government, and which he is carrying into execution in association with one of the most influential of Russian wealthy aristocrats. This invention is a watch which goes by electricity, and with scarcely any movement; it is therefore simple in construction, and easy to handle; it is cheap,

and above all, keeps correct time. It attracted the attention of the well-known Professor of Physics at the University of St. Petersburg, Herr Chwolson (son of the renowned Orientalist of that Committee of *Savants* at the Ministry of the Interior has written an article on the subject in the *Nowosti*, from which I extract the following particulars: 'In its remarkable simplicity this invention can only be compared with the Jablochkoff system of electric lighting. The watches are without any springs and consist solely of two wheels. Besides being true they have the advantage of the second hand moving in single momentary leaps, as is usually the case only in very costly watches, and which is of the utmost utility for astronomical observations. These watches can also set in motion a certain number of watches of the same construction, so that they all keep exact time. The invention has convinced me that the watches can be used for the purpose of telegraphy. After naming several other advantages, Professor Chwolson describes the invention as a wonder which will cause an entire revolution in the manufacture of watches. Herr Schisgal is the son of a Jewish watchmaker in Berditschew, where he commenced his studies at the Realschule. He subsequently left for Kieff in order to enter the Gymnasium, but the Anti-Jewish outrages which raged there two years ago, aroused in him a determination as it did in so many other Jewish students, to leave Russia and seek a new home in another land. But before quitting the country he resolved to thoroughly master his father's profession, and with this object in view he returned home. There, besides learning how to make watches, he occupied himself with the study of physics, and especially of electricity, and he turned his attention to the desirability of bringing the latter into relations with his occupation. This kept him engaged for about two years, until he hit upon the idea of his invention, which took him three months to work out and perfect. Several prominent persons have evinced the utmost interest in him and have made splendid offers to enter into business connections with him. From far and near, especially from military circles, he received telegrams congratulating him on having conferred so great an honor on his fatherland, the senders evidently being unaware that he is a Jew. As I have already stated, he has concluded a contract on most favorable terms with the well-known Crœsus, M. Paschkow, and as he is still a minor, his elder brother has arrived here in order to complete the necessary legal formalities for the constitution of the firm. The Governor of St. Petersburg has granted the young inventor the right of residence in that city until he obtains this right, *eo ipso*, as an artisan."

COSTLY CLOCKS.

The Philadelphia *Record* publishes an interesting article on the subject of quaint clocks, and how Mr. G. W. Childs, the distinguished philanthrophist, takes note of time to the value of some $30,000. The writer says that when General Grant returned to Philadelphia after his great tour around the world, he brought to his friend, Mr. Geo. W. Childs, a large hall clock, which he designed as a companion piece to two remarkable timekeepers then in Mr. Child's possession—one had ticked for more than two centuries in an Austrian cloister, and had rung out the signal which daily roused the monks to their devotions; the other is the most complex and the most complete piece of time-measuring machinery that can be found in America. To look at these curiosities a reporter visited the private office of the *Ledger* publisher, on Sixth street, below Chestnut. The apartment is patterned somewhat after a room in Coombe Abbey, Warwickshire, which one of its lords had fitted up for the reception of Queen Elizabeth. The quaint open fireplace, high wainscoting, the plaster penants of the ceiling, the Flemished stamped leather for wall papering, and the tile flooring are in perfect accord with the style and traditions of these massive timepieces.

Meantime a glance around the room revealed clocks in every place where such heavy articles could be put. On Mr. Child's writing desk were three odd looking timepieces. On the top was a clock made with lapis lazuli case, one foot high and ten inches broad. Stone as it is, the clock case is worth more than its weight in solid gold, and is the highest priced article in the room.

Immediately below is an odd looking ornament, consisting of two uprights supporting what at first glance appears to be a ball, but which is a Japanese clock, the dial completely covering the front half of the sphere, and curious hands pointing out Japanese scrawls to denote the hours. The works inside rock like a cradle. There is a third clock on Mr. Child's desk, an ornamental steeple clock, which is set in a stand, that indicates the day and date of the month.

Over the old fashioned fireplace, where the grate is suspended by heavy iron crane, there is a basso-relievo, wherein a winged Cupid is depicted bearing an hour-glass, to typify the flight of time, while on the mantle immediately overhead is a bronze and Marble French clock of beautiful design and exquisite finish, and of such fine workmanship that it does not vary hardly more than a minute in a year. It has a perpetual calendar attachment, at a cost over $800.

On either side of the mantle, under life-size pictures of Messrs. Childs and Drexel, are clocks marking two periods in French history. One has a case of tortoise shell inlaid with bronze scroll work, such as was fashionable in the time of Louis XIV.; the other is in the Rococo style, which was popular during the time of Henry IV. The bronze case, nearly three feet high, is profuse in decoration of a debased style that succeeded the first revival of Italian architecture.

Above a huge ebony cabinet filled with curios of every variety, stands an antique English clock, with square ebony case. It is very plain and very old, the seconds being measured by a verge escapement, which was supplanted more than 200 years ago by the pendulum.

Another expensive clock on the walls has a case of malachite ornamented with bronze. This is Russian work. The clock stands on a neat bracket of malachite and bronze, that was made in this country to Mr. Child's order, at a cost of $250.

The glance around the room from desk, and mantle, and bracket, and cabinet, now strikes three hall clocks—the dearest treasures of the collector. The "convent" clock, which came from an Austrian cloister, is over 200 years old, is roughly made, and is exceedingly crude in its mechanism.

General Grant's present, sometimes known as the Grant clock, and often named the Klingenburg clock (after its maker, John Klingenburg, of Amsterdam), is of great value. But, precious as are these two tim keepers, they are commonplace as compared with the Rittenhouse clock, which occupied an hon-

ored corner in the magnificent office. For ingenuity, and accuracy, and beauty of workmanship, it is believed to exceed any clock in America. David Rittenhouse, a famous Philadelphian, after whom Rittenhouse square was named, made the clock in 1767, for Joseph Potts, who paid $640 to Rittenhouse. This timepiece was much sought after in the early days of the republic, 125 guineas having been offered for it by Lord Howe, when he was holding Philadelphia under occupation. Later on, the Spanish Minister of the United States wanted to make a substantial present to his sovereign, and offered $800 for this clock. It however, fell into the possession of the Barton family, who retained it until it was bought by Mr. Childs in October, 1879. The intricacy of its mechanism is wonderful. It contains seventy-two wheels, with 5,685 teeth. It is operated by three weights, aggregating 100 pounds in weight. In addition to the timepiece, it has a musical attachment, and a limited planetarium in miniature. On the face are six dials. The main dial in the centre has four hands, indicating seconds, minutes, hours and days, the last being so set as to run perpetually, with due provision for leap year and all the other vagaries of the calendar. The phases of the moon are also shown. The second dial accurately represents the movements of Venus, Jupiter, Mars, Mercury and the earth around the sun, each of the planets being represented by a small gold ball that makes its orbital revolution around the central sun with wonderful precision. Thus far the gold ball marked Jupiter, has made only nine and a half revolutions since the clock was made—114 years ago. The rim of the dial is marked with the signs of the zodiac, thus showing the location of each planet.

Equally curious is the dial in the upper left hand corner, which describes the moon's phases in its course around the earth. The moon is portrayed by a ball, half white and half black, which slowly traverses around another ball representing the earth, the moon being made to revolve on a pinion in such a manner as to give the correct view of it when in its various stages of reflection. The lower left hand dial shows Saturn slowly crawling along its twenty-ninth-year course around the sun. Another atmospherical feature of the clock is its sun-dial, which shows sun time, fast or slow, in comparison with mean meridian time. The movement necessary for this dial is exceedingly intricate and rare. The sixth dial reveals a combination of chimes, which play at every quarter, half and full hour. A hand is turned to one or ten numbers, and when the quarter point is reached a peal of choral music is heard, lasting for a minute. A gentle push on a little knob on the dial brings a repetition, and the twenty tiny bells gush out their sweet melodies.

It was while the scribe was glancing at this atmospherical wonder that the State House bell tolled out its heavy mid-day clang, and almost at the same instant a flood of music deluged Mr. Child's office. Each of the seven clocks, excepting the antique "English" struck the hour—the atmospherical clock in deep, rich tones; the convent clock with a high tingling sound; the mantle clock with a softness that is characteristic of French timepieces; the Louis XIV. clock on a highly toned bell; the Rococo clock with a healthy, loud sound, and the lapis lazuli with a pleasing jingle. Then the chimes struck up, and for another minute sweet concord pervaded the room. The effect was thrilling. The products of two continents were brought into an array that pictured distinct successive periods of progress in handicraft and scientific attainment. It was a blending of times and peoples, of history and art.

These clocks in Mr. Child's office could not be bought for any money. They cost over $10,000, while $30,000 will hardly cover the cost of all his clocks, numbering fifty, the others being divided among his summer house at Wootten, his Long Branch residence, and his mansion at Twenty-second and Walnut streets. Every room in each of these domiciles has its clock, and each clock has its peculiar merit. In the library at the corner of Twenty-second and Walnut streets is a heavy clock, rich in design and finish, that was once owned by Prince Napoleon; while in the parlor, between the two front windows, stands what is perhaps the most costly parlor clock to be found in the world. It weighs two tons, and stands nine feet high, onyx and verde antique forming a base of two feet square and four feet high. On this pedestal poses a life-size figure in silver of a woman, her raised arm poising a circular pendulum which operates the machinery in the base. The clock has a quiet history. It won universal admiration, as well as the grand prize, at the Paris exhibition of 1867, when Le Grand Lockwood bought it, after a sharp bidding with the Emperor of Russia, and placed it in his palatial home in Norwalk, Conn., where it remained until Lockwood's riches had been squandered, and the auctioneer mounted the block to sell off the effects for what they would bring. Mr. Childs had visited the place eleven years ago, when studying designs for his Walnut street house, and upon announcement of the auction sale, the *Ledger* publisher went to Norwalk, and there encountered A. T. Stewart's agent in competition. The price was started by Mr. Childs at $1,000. Mr. Stewart's man bid $2,000, and Mr. Childs bid $3,000. Tapping the *Ledger* publisher on the shoulder, the representative of Stewart said, with surprised tone:

"Mr. Child's, I am bidding for Mr. Stewart."

"I can't help it," said Mr. Childs, "I want that clock."

"Four thousand dollars," exclaimed the agent, turning to the auctioneer.

"Six thousand dollars," said Mr. Childs, and to him the clock was sold.

WENZEL JAMITZER.

PRODIGALITY OF THE MIDDLE AGES—SUMPTUARY LAWS.

The native city of Albrecht Durer—Nuremberg—had, in the 16th century, become the brightest star in the constellation of prominent German cities. Although Augsburg attempted to be a worthy rival, Ulm, Eslingen, Strassburg, Frankfort, essayed to vie with it, nevertheless, Nuremberg sounded the key note. Both Emperor and Empire has tacitly acknowledged it by fixing upon Nuremberg as the seat of the Imperial treasury, and the ancient German royal crown was guarded in its walls since the year 1423. Pope Martin affirmed it by a special bull, confiding to the city "the perpetual care of the paraphernalia of State," and, indeed, they remained there until the German nation was no longer a Roman Empire, and these insignia had to be conveyed to a place of safety, to protect them from Napoleon's cupidity. A patriotic professor of Wurzburg kept them hidden in his trunk for eight years, and only delivered them in 1815 to the Austrian treasury.

Nuremberg's goldsmiths were especi-

ally noted for the wealth of their origiual and artistic conceptions, united with the highest skill and harmony of execution, with which they wrought perfect works of art. The spirit of Albrecht Durer hovered for another century in their midst, and many a one showed himself worthy of following his footsteps.

Wenzel Jamitzer was the chief of all.

He was a scientific goldsmith, especially famed for his several inventions in mathematical instruments, and their use; he wrote several excellent treatises on the subject; he was also one of the most famous clock makers of his times, constructing several complicated movements, etc., and other works.

The great prodigality which had become customary among the nobles, and in different counts, with regard to personal ornamentation, since the day of the crusades, proclaimed the high self-estimation entertained both by knighthood and princedom, and which also passed over to the free, wealthy citizens of the country. "Gold was the word, gold was desired by all." The goldsmith had good customers, and his work was the representation of the period. At first he laid more stress on the solidity of his wares, while gradually, when the people became more refined, he also became more ambitious, stimulated by the growing culture and refined taste, of producing the most admirable masterpieces. Table service proclaimed the wealth of a family, together with gigantic beakers and drinking cups, and overload of ornamentation in attire, necklaces, rings, spangles; the knights were encased in gold and silver armors, beautifully engraven with the most delicate interlacings of arabesques, or inlaid with gold. This prodigality in dishes and personal ornaments was fully sustained by the sumptuousness in eating and drinking.

When Duke Charles the Bold, of Burgundy, in 1473, travelled to the diet at Trer, his suite consisted of 5,000 well armored and mounted men. He himself was dressed in a gold dress, studded with pearls, estimated at $200,000. He invited the Emperor, Charles V., to St. Maximin, and Hans Sachs, the chronicler of the festivity, says that at the dinner entertainment, all the dishes were of silver, and the beakers and cups were resplendent with jewels and pearls. Four courses were served, the first of which consisted of fourteen, the second twelve, the third ten costly covers; for the fourth, thirty gold vessels were served with spices and confectionrey; the largest dish was estimated at about $2,000.

Berlepsch says that Electro Moritz caused four hundred and fifty pounds of silver to be weighed out from his treasury, to be manufactured into dishes, intended for the marriage of his son, the future King August of Poland, with a Princess of Denmark.

King Sigismund of Poland and Sweden, in 1606, presented to his bride a dinner set of pure ducat gold (22.8 karats); the cost of the manufacture alone of the basin with water can (for washing the hands after meals) was valued at $8,000. The attire of the bridal pair represented a value of $700,000; the king wore fine diamonds, estimated at $1,000,000, in his diadem.

The citizens of Paris presented to Charles VI., and his young spouse, Isabella of Bavaria, golden dishes and vessels of a weight of 450 marks, and to the Duchess of Touraine a dinner set 200 marks in weight. So says Froissart.

Berlepsch relates the almost incredible story that toward the end of the 16th century, the prodigality in gold and silver vessels was so great in Spain, that a man called himself poor if he did not possess at least 800 dozen plates and 200 dishes of the noble metals. It is said that many households had as many as 1,200 dozen of heavy plates and 1,000 dishes. The treasures of the recently discovered America was assimilated in this manner in European luxury. According to the chronicles of Sevilla, the Spaniards brought 1,336,000,000 ounces of gold into Spain between the years 1519 and 1617.

Beside goldsmithing, also the working in tin attained its perfection in those wealthy times; a goldsmith, Jean Davet, of Langres, also called Danet, or the Master of the Unicorn, from his stamp, flourished as an engraver of tinware. But as an offset to the luxury of western Europe, all the art pursuits had retrogressed so far in England that the barons had not ever tinware upon their tables, but drank out of wood or leather vessels, wherefore it was said in irony, that "the English got drunk out of their boot shafts."

The goldsmiths of western Europe, above all, the French, sought to commingle with this taste for luxury in dishes, an excessive indecency, and combined their productions with voluptuous representations, especially their large drinking cups and goblets. Truly wonderful works of their lacivious taste could be found in the court circles of the middle ages. Only to give one instance, Philipp the Good, of Burgundy, caused a female statute of gold to be made, from whose breasts issued the wine at table, and a young girl of enameled gold, in nearly the posture of the Venus of the Capitol; a fountain of the purest wine, caught in a transparent vase, issued from under her modestly folded hands. Other show and drinking vessels were more ingenious and artistic. A bell figure, for instance, held a smaller beaker at a poise, revolving around its axis if it was tipped over to drink therefrom. Else it consisted of a female silver figure, richly enameled with lower dress seam, jacket and headdress gilt; she held, raised above her head, the drinking cup. A similar beaker of Wurzburg prebendary contained hidden wheels, to be wound up with clock movement; the lady moved from place to place, when set upon the table.

Finally, the extreme was met. The Emperor and the country, the individual princes, knights, nobles and city governments, all resolved to counteract this senseless dissipation and luxury with strict laws. The nobles had generally become impoverished thereby, and they resolved in 1479, at the 28th great tournament held at Wurzburg, to adopt a sumptuary law, by which all gold ornament, both in attire and armor, was prohibited; neither the women were excepted. Charles V. issued a law in 1530, under heavy pains and punishments, with provision forbidding the country people for wearing any jewelry whatever; the citizen might wear a gold ring, without jewel, of the value of five or six florins (35 cents apiece)—and their wives, a girdle up to ten florins; merchants' wives one of 20 florins; their daughters and unmarried ladies, a headdress, at 10 florins; rich city councilors and particians could sport a ring of 50 florins; noblemen could adorn themselves with a chain of 200 florins, and real knights, up to 400. Counts and gentlemen might expend 500 florins therefor, and their spouse as much as 600. The goldsmiths also were prohibited from employing the noble metals uselessly for articles of ornamentation, nor could they sell valuable articles to persons of low degree.

Of course, these stingent laws fell

THE

JAMES BOSS GOLD WATCH CASE,

is the best protection for the Movement that has ever been put on the market.

IT IS STRONGER, STIFFER, MORE COMPACT AND CLOSER FITTING

than any other, and is the only case containing a

DUST BAND.

This dust band encircles the inside of the case in such a manner as to

Prevent any Dust or Dirt

FROM WORKING INTO THE MOVEMENT,

and is the greatest improvement ever adapted to

Watch Cases.

In Finish and Ornamentation the Jas. Boss Case is unapproached. They are sold by all Canadian Wholesale houses.

The Canadian trade will remember that this case is recognized by the Jewelers of the U. S. as the standard, and is the only Filled case that has given entire satisfaction through all time.

short of their aim; the goldsmiths had a large noble patronage for their masterpieces, and German art articles were sought everywhere. Wenzel Jamitzer is the most illustrious representative of the art producers of that age. He enjoyed a high renown, and was the court goldsmith for four successive German Emperors: Charles V., Ferdinand I., Maximilian II., and Rudolph II. This circumstance placed him above the sumptuary laws, and unheeded, he manufactured the costliest gold and silver vessels.

His style was especially distinguished by the delicate embellishment of large, tasteful articles with animals, insects, flowers and herbs in silver, of so delicate a construction that when the breath was blown against a blade of glass, it moved, The art collections of Dresden, Berlin, Vienna and other cities pride themselves at the present day on enclosing one or more pieces manufactured by him. We can do no better than describe one piece he wrought for the city of Nuremberg, and which for many years constituted the chiefest ornament upon the gala tables as festivities and receptions. It is of silver, about three feet high, and at its broadest part measures about eighteen inches. In the most ingenious manner does he represent in this construction, nature as the bountiful giver of everything in excess than man consumes, either prepared in the highest culniary art or in its original shape—and not alone the donor to man, but also to animal, frog, lizard and snake, worm and insect, that appears to glide around the silver leaflets and haulms of the work of art.

A scenery of mountain and forest arises from an admirably represented meadow, the former adorned with flowers, bushes, snow bells, and other plants handsomely executed in enameled colors. Latin inscriptions are worked through the vegetation and among the animals, at the foot of the mountain:

"The heavy bunches of grapes are as little burthensome to the vine as the fruit is to the green branches."

"Thus is carried the powerful castle by the rocky support of the earth."

"Easy the burthen that a rejoicing heart easily bears."

From among this luxury, Nature, surrounded and enveloped by its creations, arises in the shape of a handsome woman, of antique form, of silver, with hair and dress of gold. She holds a cornucopia with both hands above her head; four small angels' heads adorn it, with two inscriptions.

"Why I, a delicate woman, bear so heavy a load of fruits, or what goddess I am, do you ask?"

"I am the earth, the mother of all, laden with the costly load of fruits engendered by me."

The cornucopia widens into a broad mouth, opening from the leafwork, as it were, and entwined with a hundred forms chased in silver, or cast, such as flower stalks, rose buds, meadow flowers, berries and haulms. Three winged genii arise from its midst to support the bowl, which surmounts the whole. Inscriptions are again introduced, upon small shields above the genii:

"Glory ye the Lord with songs of praise, oh grateful spirit mortals."

"Whatever the fertile earth bears, are but donations divine."

"But we, servants of the Lord, stand mute at the great divine bounty."

The bowl itself is gilt, and interlaced by leafwork in gold and enamel, through which wind snakes and lizards. The interior of the bowl is extraordinarily rich with all the emblems of fertility, and interwoven with animal and ornamental figures in an ideal combination; an excellent relievo, from which, as uppermrst ornament, issues a bouquet of bell flowers, lilies, parsley, carrot leaves, and a wealth of bloom in mat silver, so delicate, light and graceful that it expresses the master's highest conception of art.

Wenzer Jamitzer died at the age of 78, on December 15, 1586.—*Jewelers' Circular.*

HIGH-PRICED BEANS.

Tom Watrous, commercial traveller, stopped off at the Marshal, Mich., eating house several years ago. He was not very hungry and called for a plate of beans, which he received. He inquired the price, and was informed that it was seventy-five cents.

"That's a thundering price for beans," said Tom.

"That's the price," said the proprietor.

The train was just starting. Tom paid the bill, and the coaches bore him and his indignation on toward Detroit.

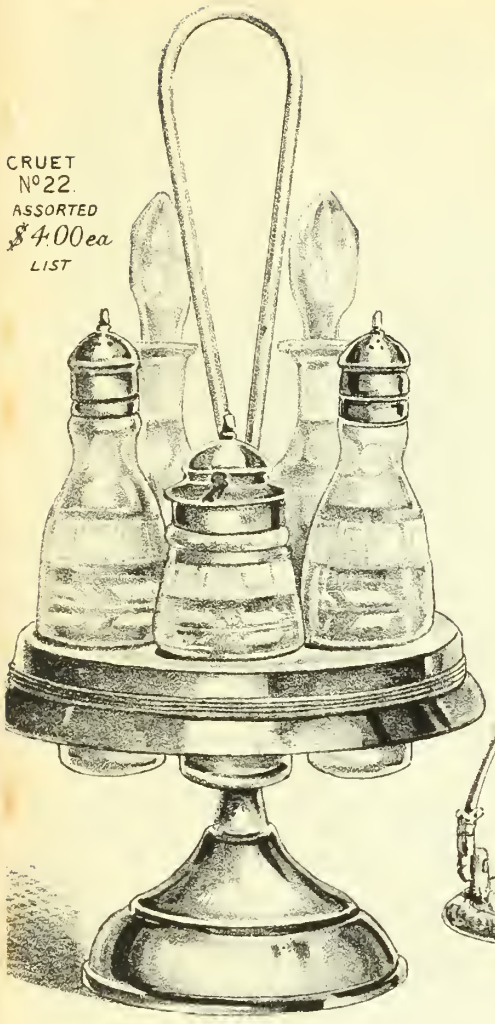
This was on Sunday. On Monday, Gilmore, the eating house man, received a telegram, collect on delivery, $1.25, which he paid, and read on opening it: "A thundering price for beans."

Thirty days from that date a neat express package was handed to Gilmore C. O. D., who paid 90 cents for the privilege of opening it to discover a lot of sawdust, on the top of which lay a slip of paper with the cabalistic symbols: "A thundering price for beans!"

Two months from this Gilmore was summoned to Chicago to meet a former business partner, and the hotel clerk handed him a letter conveying the pleasant information: "A thundering price for beans!"

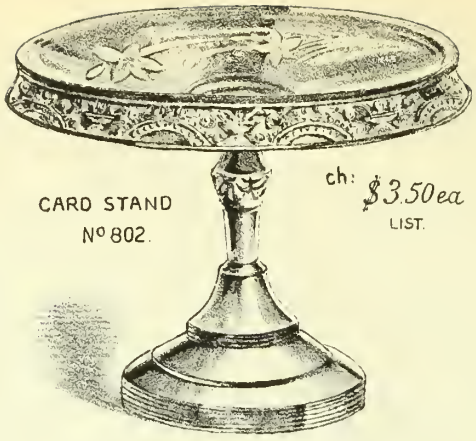
During Gilmore's absence his son paid for two telegrams and one express package, directly on the subject of 75 cents being "a thundering price for beans!" Cost of these articles, $3.80. A genuine telegram from Gilmore's mining share broker advising him to sell was refused, and the loss of it entailed an actual damage to Gilmore of $1,500.

A year rolled away. Gilmore ordered a case of Mackinac trout from Detroit. They came C. O. D., $13.83; when opened he found every fish had been removed from the ice and sawdust, and a shingle met his eyes, marked with a blue lead pencil: "A thundering price for beans!" Trouble arose between Gilmore and the Detroit fish house, and they went to law, Gilmore winning the suit, $25 damages, and all at a cost for the attorney's services of $86.90.



Gilmore grew dejected. Life looked gloomy. Letters poured in on every one of his family at regular intervals from all parts of the world, bearing the unpleasant information that it was "a thundering price for beans.

At last Gilmore sold the Marshall eating house and moved to Chicago. He carried his deep affliction along with him, gnawing like a cancer at his vitals. The persecution never ceased. Gilmore drooped, faded and finally died. The terribly afflicted family followed him to his last resting place, and the widow, with what little money she had saved from the expense of bogus telegrams and express packages, erected a plain marble slab to the memory of the tortured Gilmore.



The following Sabbath the mourning family went out to the cemetery to plant some violets on Gilmore's grave. Arriving on the ground, they observed in silent horror that another legend appeared above the name of Gilmore on the tombstone. It was chalked on a small blackboard and read; "A THUNDERING PRICE FOR BEANS."

SOMETHING NEW IN GOLD CASES

We would call the attention of the Trade to our

10 Karat Gold Cases.

These goods are made in every Style and Size to fit the Waltham Movements, and are manufactured in the following way. The outside, or wearing surface, is 14 karat gold. The inside, or not exposed surface, is 8 karat gold, and when taken together the case wil lassay 10 karat. Thus possessing every quality of a much higher grade of case, and for Style, Finish and Duribility are FAR SUPERIOR TO ANY OTHER THAT IS OFFERED TO THE TRADE AT THE SAME PRICE.

FOR SALE BY ALL LEADING JOBBERS IN CANADA.

Robbins & Appleton,

SOLE AGENTS,

New York. Boston. Chicago. London, E. Sidney, N.S.W.

CURIOUS DIAMOND STORY.

Rubies and diamonds may be bought too dearly at Rome. In March, 1879, Count Telfener paid a Roman jeweler 55,000 francs for a necklace of diamonds and rubies, the latter being valued at 800 francs the karat; but when the Count went to Paris he found, to his surprise, that the rubies were only worth 200 francs the karat. He accordingly taxed the jeweler with deceit, and demanded the restoration of his money. The jeweler consented to take back the necklace, and to give promissory notes at three months' date for the money to be refunded, with the condition that the bills should be renewed if the necklace was not sold before maturity. At the expiration of the three months, the bills being unpaid, were protested, and Count Telfener took legal proceedings against the jeweler. These proceedings failed in the Tribunal of Commerce, and the Count was sentenced to pay the costs. He then tried the criminal side, and failed again, for the magistrates, after ordering the necklace to be impounded, decided that their was no punishable offence committed. The jeweler, thus far triumphant, next brought an action against Telfener for compensation for the damages, moral and material, suffered in consequence of the protest of the bills, the criminal action, and the impounding of the necklace, and he succeeded in obtaining a decree of 12,000 francs, in compensation for the moral injuries caused by the protesting of the bills and the penal action, the damages for the impounding of the necklace being reserved for a separate trial. Upon the hearing of the case by the Court of Appeal, the sentence of the inferior tribunal was set aside on the ground that the jeweler had himself to blame in part for the inconvenience he suffered, and that the sequestration or impounding of the necklace was the act not of Count Telfener, but of the magistrate. The jeweler pays the cost of the last, and the Count pays that of the earlier trials, Count Telfener remains without the necklace, and. for some time at least, without his 55,000 francs.—*Ex.*

Correspondence.

To the Editor of THE TRADER.

DEAR SIR.—In one of the numbers of THE TRADER you invite correspondence from the trade, which is my excuse for troubling you with my grievances; for be it known that I am a man with a grievance, as the following will show.

Be it known that our village contains nearly two thousand inhabitants, we are blessed with the following amount of business, viz.: two foundries, three mills, one tannery, two sash and door factories, two undertakers, two watchmakers, two druggists, two butchers, two shoemakers, four taverns, four blacksmiths, two waggonmakers, one tinsmith, two book stores, and two bakers, also eight general stores. Some of them are stores who sell everything from a plug of tobacco to a ladies or gent's gold watch, which constitutes the grievance. Now, sir, I would like to know if there is not some way that can be adopted to prevent our business being so much cut up. It is impossible to live. One druggist sells electro-plate ware and fancy goods, the other sells jewelry. One general store keeps electro-plate ware and jewelry, another grocer keeps electro-plate ware and cutlery, and if he knows of any member of his church who wants a watch, he will try to sell him one. Among the other stores there are three or four who sell more or less jewelry.

Now, sir, what I want to know is, if there cannot be some means devised to keep the trade more in the hands of regular dealers. I do not know that it would be any use to boycot those wholesale houses who sell to any one. But I think it would be a good plan to form a league and petition the government to put a license on all who sell clocks, watches and jewelry. Will you please give us some advice in THE TRADER, and will not some one else speak, for it is time, in my opinion, that something was done, as I suppose other places are just as bad as we are. Hoping you will forgive my trespassing on your valuable space.

I remain yours, &c.,

THE MAN WITH A GRIEVANCE.

BUSINESS CHANGES FOR NOVEMBER.

Mrs. Diesfield, jeweler, Port Perry, burned out. Laing & Meharry, hardware, Port Perry, burned out. Horsman & Co., hardware, Winnipeg, out of business. Price & Glover, hardware, Aylmer, dissolved, Glover continues. R. Rutledge & Co., jewelers, Montreal, dissolved. Birks, Henry & Co., jewelers, Montreal, style, now Birks & Co. C. J. Armstrong, hardware, Aurora, given up business. "Bullock Hardware Co.," Otterville, assigned in trust. Ward & Crawford, hardware, Arkona, dissolved, A. Ward continues. Gardner & Craddock, hardware, Watford, dissolved, W. A. Gardner continues. John Woltz, jeweler, Winnipeg, stock sold by sheriff for 56 cents on the dollar. R. Shaw, jeweler, Clifford, dead.

BUSINESS NOTES.

"TELEGRAPH BLUE" is a new color. It is the shade of a man's face when he gets a despatch from his broker asking for more margin.

THE many friends of Mr. A. S. Murray, the well-known jeweler, of London, Ont., will be pleased to know that he is able to be out again, and is now attending to business as usual.

NOVEMBER trade has not been so good as was anticipated, probably on account of the bad state of the roads. It is, however, thought that December trade will be lively enough to make up for it.

WE are glad to learn that Mr. W. P. Cooke, jeweler, of Port Arthur, who has been prostrated with a severe attack of typhoid fever, is up again and expects to be as well as ever very soon.

WE had a flying visit from Mr. C. M. Fogg, of the firm of C. N. Thorpe & Co., makers of the Keystone and Boss cases. Mr. Fogg reports trade in their line booming in the United States, and that they are unable to keep up with their orders.

THE Allan line steamer, *Peruvian*, on Saturday, 24th November, was the last of the Allan line mail steamers via the St. Lawrence this year. After this the mail steamers will sail from Portland every Thursday, and will call at Halifax every Saturday for the passengers and mails.

THE Otter Sweeper Co'y., of Otterville, is in difficulties, and shareholders think of winding up its affairs and distributing the assets. Outside liabilities are not large. The company manufactured bicycles, children's carriages and carpet sweepers. The trouble is attributed to inefficient management.

WE learn that in the case of Stewart, Dawson & Co., whose consignment of imported watches was recently seized by the local Customs Authorities, the Minister of Customs has decided that the goods were undervalued by twenty per cent. In addition to paying this amount of extra duty the firm are mulcted in a fine of fifty per cent. on the entire value of the consignment for the undervaluation. Later on we may have something further to say about this class of traders, their goods, and their method of doing business.

IN spite of our warning two months ago many American Manufacturers and Exporters neglect to write across the foot of their invoice "certified correct" and sign the firm's name below. In some cases this arises from ignorance, in others from carelessness, but from whatever cause it may arise, the result is the same to the importer; he can't pass his goods through the Customs until the invoice is thus certified by the shipper. American trade journals who want to do something for their patrons in the manufacturing line should draw their attention to this alteration in the Canadian Customs regulations.

SAYS the *Monetary Times*, "There is a mix-

FACTORIES: WALLINGFORD, CONN., U.S. AND MONTREAL, CANADA.

ture of simplicity and cheek about the letter which we print below, that is entertaining. It is printed in the New York *Times* as an unsolicited letter received the other day by a firm in St. Joseph, Mo.: "I would like to travel and sell glassware for you. I am sixteen and a half years of age. I have got the cheek to sell goods The way to sell goods is to show the man your goods and tell him your price. Write soon and state salary that you will give and expenses, and tell me what section of the country you want me to work in." It appears to us that this youngster is pretty much the same as a lot of jewelry trunk-peddlars who are cropping up in Canada at present. They certainly have the cheek and about as much knowledge as this young man was honest enough to boast of.

H. Vineburg, who ran clothing stores in Cornwall and Arnprior, had the idea that any person could run a jewelry business and therefore started that branch in connection with his other. The result, however, has again proved the folly of a man going into a business he doesn't understand, for, without doing the regular local jewelers, who thoroughly understand their trade, any harm, he has been "hoist with his own petard" and become a bankrupt. His stock was lately sold out and will only pay some 21 cents on the dollar. We understand a prominent Montreal jobbing jewelry firm is in for some $600, and it is needless to say they have not much sympathy amongst the local jewelers.

The age moves slowly after all. They have had twenty-four hour clocks in Italy for many years, and on this side of the ocean people are only now approaching the subject, and even that they are doing with marked hesitation. One of the Detroit papers has adopted the twenty four hour system, but the change will be apt to mystify its readers, who have to make a mental calculation as to what fifteen and sixteen o'clock mean. Much of the difficulty in making the change would be avoided if it were begun by having the figures up to twenty-four painted under the other figures on the dials of the watches and clocks. But it is likely that the people of this country will go on in the old fashion of distinguishing the hours by A.M., and P.M. It would sound simply terrible if a person were to stay out till twenty-three or twenty-four o'clock.

The fire in Port Perry, Ont.,last week, seems to have been a most disastrous thing for that town, and proves once again the necessity for adequate protection against the ravages of this devouring element. The experience of recent years has been that in small towns, built mostly of wood, when once a fire gets fairly under way a general sweep, is made, and this holds good in the case of the Port Perry fire, probably more than half of the places of business being destroyed. Mr.W. H. McCaw, jeweler, was fortunate enough to escape, owing to the presence of a lane between his store and the fire, and the fact that the wall of the burning building next the lane fell inwards instead of outwards. Mrs. Diesfield was not so fortunate, as she lost her shop, valued at $3,000, insured for $2,000, and all her stock, on which it appears there was no insurance. This latter fact is to be very much regretted, and although it was a costly oversight on her part, Mrs. Diesfield will have the sympathy of the entire trade.

Burglary.—We are sorry to learn that Mr. G. L. Darling, the well-known jeweler of Simcoe, had his safe blown open and its contents, amounting to about $12,000 abstracted. From the skillful way in which the burglars went about their business it is probable that they are experienced cracksmen from the United States, who, finding their own country too hot for them, are trying to make their enforced stay in Canada as profitable as possible. We trust that before they go much longer some good citizen will, with the help of a revolver, let a little Canadian daylight through them, or that they may find their way down to Kingston penitentiary for a term of years. Mr. Darling has the sympathy of the entire trade and we sincerely trust that the scoundrels may not only be brought to justice, but that Mr. Darling may be successful in getting the goods back. So far this does not seem probable, for although three fellows have been arrested on suspicion, it is questionable whether the police are on the right track or not.

Mr. Mackenzie Bowell, the Minister of Customs, having returned to Ottawa, will probably stir up Mr. Johnston, his deputy, and Mr. Fraser, the appraiser, and instruct them to do less cheese-pairing in dealing with the goods brought in by importers. It is a mistake to deal with the wholesale merchants of the country as if they were a band of smugglers, intent on getting everything into this country without paying the customs duty. Mr. Johnston is described as being a fussy old official, ripe for superannuation, and Mr. Fraser is accused of not understanding the duties which he is called upon to perform, aud giving decisions that are directly opposed to each other. Mr. Bowell appears to think that if there are any grievances they grow out of the customs laws and these cannot be amended except by parliament. The importers however think differently, contending that the officials at Ottawa who interpret the laws are to blame, and that vexatious and conflicting interpretations are made, the result being to seriously interfere with the importation of goods without in the least benefitting the public treasury. The Ottawa offi cials will no doubt get a stirring up.

Another Burglary.—We are also sorry to report that on the night of the 17th November the jewelry store of Mr. James Trotter, Galt, Ont., was entered by burglars, and goods consisting of gold and silver watches, sets of jewelry, rings and chains to the value of about $7000 stolen, also $120 in cash. Entrance was obtained from the rear of the store by boring a number of auger holes in the outer and inner doors, knocking a piece out, making a hole sufficient to admit a man's body. The door was drilled and the lock punched off the safe, which contained the money and the most valuable property, all of which was taken. The burglars outside operations were hidden by a building in a back lane, with an entrance to the back part of the store. The door of this building was locked by the burglars from inside, preventing suspicion on the part of the night watchman, who tries all the doors every half hour. Their inside operations on the safe were well-screened by the counter and show cases. Following, as this one does, so closely upon the heels of the Simcoe burglary, it is quite apparent that the gang of burglars now in Canada are bound to make a clear sweep of every valuable jewelry stock they can safely manage. Mr. Trotter's store was apparently well-protected, and his safe was a large, fire-proof one, of first-class make. The result however shows that when skillful burglars have a chance to operate in quiet, they can very easily secure goods thus protected. With the trade generally, we sympathise with Mr. Trotter in the loss of his honestly acquired wealth, and we trust that the perpetrators may speedily be brought to book.

Simon P. Kleiser, the well-known retail jeweler of Toronto, has succeeded in acquiring a considerable amount of unenviable notoriety lately. It appears that someone owed Simon P. an account, and that either not being able or willing to pay it in cash, induced him to take a faro table and appertenances, for the amount. Having got the material for a faro bank, S. P. seems to have been persuaded by some friend that all he had to do to secure a fortune was to run his "little machine" and become its banker himself. As pictured by the persuasive tongue of his friend, it was a soft thing, and like Col. Sellars, S. P. became infatuated with the idea that there was "millions in it." Well, the bank finally got under way, and several young fellows about town who were known to have money and not averse to "putting it up," were invited to patronize the establishment and try their fortunes. Strange to say these people won every night until at last Simon P's funds ran dry and the bank broke. This almost unprecedented ending of a presumably prosperous speculation seems to have brought Simon to his senses, for we very soon find him invoking the aid of the police magistrate to help him in getting his lost money back. If the breaking of the bank was strange this was a stranger incident, for it now became apparent to the curious public that instead of plucking the pigeons as he had intended, the pigeons plucked him. The true inwardness of the matter seems to have been, that the friend who advised and helped him to start the bank really stood in with the pigeons, and that poor Simon P., instead of making a tool of them was himself made a tool of. As the case appeared at the Police Court, Kleiser cut but a sorry figure in the transaction; a would-be gambler, without either nerve or experience, he has made himself a laughing stock for the public benefit. It is to be hoped that Mr. Kleiser has learned a practical lesson by his experience in the gambling line, and that in future he will give it a wide berth.

The alleged Customs frauds in Montreal are creating a good deal of excitement among business circles in that city at present. We give below an account of the seizure, given by the *Mail's* Montreal correspondent, without endorsing it in any way, as we are up to the present time without full information regarding it. We trust, however, that Messrs. Jones & Co. may be able to clear themselves fully from the charge now made:—"There is a great

this Trade Mark is stamped on all Knives, Forks, Spoons and other flat ware of our manufacture.

The A 1 Goods are Standard Heavy Plate, and XII signifies that in addition the articles have an extra quantity of Silver on all the parts most exposed to wear.

The Meriden Britannia Company have been awarded the highest premiums wherever exhibited, from the WORLD'S FAIR, 1863, to the PRESENT TIME, and the high reputation of our Goods throughout the world has induced other makers to imitate our Trade Marks and name as well as our designs, and as many of our patrons have, through a similarity of names, purchased inferior goods under the impression that they were our manufacture, we are compelled to ask especial attention to our Trade Marks.

THE FACT THAT OUR NAME AND TRADE MARKS ARE BEING SO CLOSELY IMITATED SHOULD BE A SUFFICIENT GUARANTEE TO THE PUBLIC THAT OUR WARES ARE THE BEST IN THE WORLD.

WE RE-PLATE OLD WORK AND MAKE IT EQUAL TO NEW.

deal of interest taken here by manufacturers and wholesale firms engaged in paper, clock, and fancy goods manufacturing and importing in the late seizures made by the Customs authorities of a consignment of paper from Springfield, Mass., and clocks from Waterbury, Conn. In interviews with members of those trades here to-day your correspondent elicited a good deal of interesting information as to how difficult it is to prevent the Americans flooding this market to the prejudice of local manufacturers and honest importers with their goods got in surreptitiously. This appears to be done by the most disreputable tricks and manipulations by the Yankee manufacturers, with the aid of unscrupulous importers and dealers here, who become leagued together to throw dust in the eyes of the Customs officials and thereby grossly defraud the revenue. With respect to the clock seized in Messrs. John H. Jones & Co.'s establishment, and which the local papers say are only worth three hundred dollars, I am assured on the best authority they are worth more than $1,000, and besides, there is a further claim made by the Customs for $8,000 additional for consignments which the firm received during the present year, and which have been similarly entered to the last consignment, far below the domestic value in Waterbury. The *modus operandi*, I am credibly informed, by which the Dominion Government has been systematically defrauded on clocks for years past coming in here, is one of the boldest and most unblushing schemes that has ever been resorted to anywhere to steal a march upon the officials of the Customs of any country. It is the custom in America for each manufacturer of clocks to publish a catalogue with an engraving of each clock manufactured, stating its name, giving all particulars with the price attached thereto. As a matter of course the clocks get celebrated through being advertised under their particular names, and are eagerly sought for by those who are wanting to purchase such useful articles. Now the mode adopted to conceal the actual value of the clocks at Waterbury, intended for export in Canada, is to change the names of the clocks by placing printed slips over the headings in the catalogues, giving entirely different names, and by this means throwing the appraiser of the customs into the dark as to the actual value of the clocks, as they are guided by the catalogues. Of course false invoices at much less than the domestic price across the border are supplied to the accomplices in the Dominion for passing the entries in the Customs.

It is stated that the Government has the authority to go back on the importers' consignments for three years past, which is the legal limit for claiming unpaid duty, but in the case of Messrs. Jones & Co., they have resolved on making the firm account for only one year, as it would be difficult to trace the goods at this distance of time. It is said by the most responsible authority that the customs has obtained documents written by the importer exposing fully his part in the profitable play that has been carried on successfully so long. It will be a matter of greatest satisfaction to the local firms who have been conducting their business fairly and squarely if this unjust competition is put an end to altogether."

WORKSHOP NOTES.

To Restore Burnt Steel.—Borax, 3 ozs.; sal ammoniac, 8 ozs.; prussiate of potash, 3 ozs.; blue clay, 2 ozs.; resin, ¼ lb.; water, 1 gill; alcohol, 1 gill. Put all on the fire and simmer till it dries to powder. The steel is to be heated, dipped in this powder, and afterward hammered.

Polishing Wheels.—Take a flat burnishing file, warm it over a spirit lamp, and coat it lightly with bees-wax. When cold, wipe off as much of the wax as can readily be removed, and with your file thus prepared, polish the wheel, resting the latter while p lishing on a piece of cork. The finish produced will be equal to the first buff polish, while there will be no clogging, and the edges of the arms and teeth will remain perfectly square.

Crocus Polishing Powder.—Culinary salt sulphate of iron (iron vitriol) are well-mixed in a mortar. The mixture is then put into a shallow crucible, and exposed to a red heat; vapour escapes, and the mass fuses. When no more vapour escapes, remove the crucible and let it cool. The colour of the oxide of iron produced, if the fire has been too high, it becomes black. The mass when cold is to be pulverised and washed, to separate the sulphate of soda. The crocus powder is then to be submitted to a process of careful elutriation, and the finer particles reserved for the most delicate work. An excellent powder for applying to razor strops is made by igniting together in a crucible, equal parts of well-dried green vitriol and common salt. The heat must be slowly raised and well-raised, otherwise, the material will boil over in a pasty state and be lost. When well-made, out of contact with the air, it has the brilliant aspect of black lead. It requires to be ground and elutriated, after which it affords, on drying, an infallible powder, that may either be applied on a strop or smooth buff leather, or mixed up with hog's lard or tallow into a stiff cerate.

OTHER NOTES.

The question of what becomes of pins has often been mooted but never answered. Yet it certainly is peculiar that an article of every day use which is manufactured in numerous quantities, should disappear in equal proportion. It is estimated no less than 50,000,000 pins are daily manufactured in England and Dublin, and that out of this number 37,000,000 are produced in Birmingham alone, thus leaving 13,000,000 for the production of Dublin, Stroud and London. The weight of wire, both iron and brass, consumed for this purpose is 1,275½ tons every year.

A new and curious application of the science of photography has been made at the royal gun factories in the Royal Arsenal at Woolwich, where some very successful plates have been taken showing defects in the bores of guns sent back for examination after trials. The electric light powerful lenses, and mirrors are employed for this purpose. Minute flaws in the metal undetected by the usual gutta-percha impressions have been rendered clear to the eye by these photographs, and they are likely to prove of essential service.

ZIMMERMAN, McNAUGHT & LOWE,

WHOLESALE AND MANUFACURING JEWELERS,

16 Wellington Street East, - Toronto, Ont.

Having been appointed Sole Wholesale Agents in Canada for J. F. FRADLEY & CO., we have now in stock a full line of their Silver, Gold Filled and Solid Gold Headed Canes. Orders by mail will receive prompt attention.

ZIMMERMAN, McNAUGHT & LOWE.

THE TRADER.

TORONTO, ONT., JAN., 1884.

Editorial.

"THE COMPLIMENTS OF THE SEASON."

This is the season of compliments and good wishes, and THE TRADER, in accordance with the usage of all well conducted society, takes a great deal of pleasure in wishing its numerous readers

"*The Compliments of the Season.*"

We sincerely trust that the year 1884, upon which we are now entering, may, in spite of the few clouds at present darkening the horizon, be one of the happiest and most prosperous that this country has ever seen.

THE OUTLOOK.

Although hard to believe, it is nevertheless a fact that a period of commercial depression is upon us. In spite of the N. P. our factories have overtaken and passed the demand for their products, and although the wheat crop generally has been far below the average, the price obstinately refuses to exhibit an upward tendency.

At no period during the past five years has the stock markets been so depressed, and even undoubted securities have felt the effect of the predicted financial storm.

There is no use of dissembling—things do look blue, but are they as bad as they seem, or as bad as some would have us believe ?

We think not. The over-production of our factories was a thing to be expected, and it is one of the evils of a protected market. The fall of stocks, although one sign of distress, is not always a true one. Stock broking has degenerated in these latter days as a purely gambling business, and the quoted market price is no index of its real value, more frequently is it an indication of which is in the ascendent, bulls or bears. The worst feature by all odds, and the only one really worth taking serious notice of, is the crop failure, but in our opinion this is hardly so bad as it is made out. True, the wheat crop in Ontario is far below the average, but then to counterbalance this other things are better than usual. Taking the whole of Ontario crop together, it is calculated that the harvest of this province is in excess of that of 1882 by over $7,000,000. We heard no complaint of that harvest, simply because the wheat crop was good, but does it really make any difference to the wealth or purchasing of the farmer, whether he sells one thousand dollars worth of wheat or oats, or hay, or butter, or cheese, so long as he gets the money. We think not, but our farmers apparently think it does, and just here is where the difference comes in, and it is in this difference of opinion that we find the true solution to the present cry of hard times.

It seems to us that the present panic is more of want of confidence in ourselves than anything else. A succession of prosperous harvests has made the country better off than it has been for a long time, and therefore better able to withstand a temporary depression. The harvest, although not good, is better than last year, so that that cannot be pleaded as a valid reason. Our merchants have met their accounts fully as well as in former years, so that in that respect there is nothing to alarm anyone.

Want of confidence is a fearful thing. Give a dog a bad name and you may as well shoot it, and it is exactly the same of the times, make a people believe they are poor and they will whine about being hard up, and very soon bring on the very thing from which they were seeking to escape.

We don't think we are going to have hard times yet. Trade may, and probably will be quiet for some months, but we see nothing in this to alarm ourselves needlessly about. The best way in such an emergency is to put a good face on things. While not undervaluing, do not over-estimate the danger. The exercise of economy and common sense are about the best preventives for such commercial paralytic attacks as these.

FIRE.

In our last issue we had something to say by way of warning, in reference to the danger arising from burglars ; in this article we touch upon a danger, no less real, although more common.

The fires last month in Port Perry, Napanee, and elsewhere furnish a text from which a very impressive lesson might be drawn by every business man in Canada. The man who fails to profit by such a lesson would be better out of business, or independent of it.

If able to be his own underwriter and stand such a loss, it is entirely his own business, although he would generally be regarded as a very foolish person. If, however, he owed for the goods and was not independent of business, then to his foolishness he adds an injustice to the creditors who trusted the stock to his charge in the expectation that he would take every possible precaution in keeping it safely.

No matter how careful people may be fires will happen when they are least wanted or expected, and this risk is now so generally recognized, and has been so accurately guaged, that insurance experts can tell almost to a fraction how much the country's average loss from fire will be, and how much it will cost each individual member to guard against that loss. A few years ago, but few of our business men insured against fire, now every man who pretends to have any business training whatever, not only insures against loss from this cause, but takes good care that the amount of his insurance is large enough to save him from loss.

Some people seem to imagine that an insurance policy is a kind of a charm against fire, and that if they are insured at all they are all right.

There never was a greater mistake than this, for as the rain descends upon just and unjust alike, so fire ravages the insured and uninsured irrespective of the protection of parchment policies or heraldic fire protectors over the doors of the insured.

This being the case, every man in business should make it a point to see to three things in connection with his insurance :

First. Make sure that he is insured.

Second. Make sure that he is fully insured.

Third. Make sure that his insurance is in some first-class company.

Cheap insurance usually means risky insurance, and risky insurance is but a shade better than none at all. Seeing that it is but common sense to keep fully insured in some first-class company, we trust that our many readers

will not neglect this matter, but make it a point to look after at once.

It is very comforting when a merchant gets burnt out for both his creditors and himself to know that he was "fully insured" in some good company, and in a position to start again with resources but slightly impaired. How different the situation of such an one, to the other who, scouting the idea of insurance from pennywise motives, finds himself in the event of a fire reduced perhaps to beggary, and compelled to commence life over again. "A word to the wise is sufficient."

COMMON SENSE BUSINESS.

Our editorial article in last month's issue, under the above caption seems to have roused the ire of Mr. W. D. McGloghlon, jeweler, of London, Ont., if we can judge by his subsequent actions. Since the article appeared we have received from Mr. McGloghlon a marked copy of the *London Advertiser*, containing the following elegant and business like advertisement:

"When a pig squeals his might you may believe the butcher knife is around; and the way the other jewelers are squealing about my low prices indicates that somebody is being hard pushed. See THE TRADER.—W. D. McGLOGHLON, 179 Dundas Street."

Accompanying this paper was a letter from the same gentleman, which, being deciphered, ran as follows:

"For fear you might get bilious and bust I send you two circulars; if you think they are in the interests of your ring perhaps you will publish them in full. If you so conclude, I will pay you what I think they are worth to me."

In reference to the above we may say that we never go out of our way to attack any individual dealer and shew up his shortcomings, and we should not in this instance have taken any notice of Mr. McGloghlon's affairs, but that he has seen fit to rush into print and make capital out of the general remarks we made in reference to his way of doing business. We did not mention Mr. McGloghlon's name, but since the cap fits the gentleman so well, and he is so anxious to parade it, we suppose he will thank us to give him the free benefit of any publicity that our columns can afford.

But before starting out we wish Mr. McGloghlon and all others of that ilk to understand distinctly that THE TRADER is not the organ of any ring or clique. It is published in the interests of the retail trade and as a means of communication between them and the wholesalers and manufacturers of this country. It's columns will prove that it has performed its mission faithfully and well, and we are willing to be judged, and to stand or fall by that record.

So much about ourselves; now for Mr. McGloghlon. As we said before when we wrote our article on "Common Sense Business," although we took Mr. McGloghlon's circular for our text, we did not mention him by name, as our object was simply to draw the attention of the trade generally, to the foolishness, not to say anything about the injustice, of the policy that that gentleman was pursuing, for, we are sorry to say, there are other jewelers in Canada who imagine they can crush their opponents' business by pursuing such tactics as these. We are glad to know from letters received from various parts of Canada that our views are endorsed by the best men in the trade, and this being the case, we care not how much Mr. McGloghlin and his confreres may differ from us.

In our former article we discussed this method of doing business, namely, selling "retail at wholesale prices" as Mr. McGloghlon's circular puts it, or as we would say, selling at cost price, and tried to prove from well-known facts, that such a course could not pay. We could have said a great many things about Mr. McGloghlon in support of our contention, but we were not discussing that gentlemen's merits or demerits, but simply his methods of doing business. Now that he has challenged our motives, as well as our logic, we might be permitted to say that if any stronger arguments were needed in support of our contention, Mr. McGloghlon's own business career would abundantly supply them. Mr. McGloghlon, as his own circular says, has been in the jewelry business for thirty years. Thirty years is a long time, long enough, one would think, to enable a person of Mr. McGloghlin's transcendant abilities to amass an independent fortune, and pass his declining years in comfort if not luxury. But if we are to take Mr. McGloghlon's circular for gospel, what do we find? Why, that with all his thirty years' experience and chances, he is still at the foot of the ladder and compelled to sell goods at cost in order to do business at all. We can remember this gentleman fifteen years ago, when he had the largest jewelry store in London and probably the largest in Canada, west of Toronto. Times were good, and careful business men made money. At that period Mr. McGloghlon was ahead of any of his competitors in business; to-day he is far behind them. Why is it, we ask, that a person of such superlative abilities as Mr. McGloghlon claims to possess, should have fallen so far behind in the race for commercial supremacy? Knowing Mr. McGloghlon's history as we do, we have no trouble in deciding that a false system of business is at the bottom of his want of success, and even if we had never heard of him before, his own circulars, of which he boasts so much, would effectively testify in the same direction. We confidently assert that Mr. McGloghlon's want of business success arises from selling goods too cheaply, and this he has done to his own detriment without doing his opposition any appreciable harm, as most of them appear to have flourished in proportion as he declined. We need scarcely reiterate again what we said in our former article regarding the rate of profits that retail jewelers should have in order to make a living. No person asks them or ever expects them to sell goods at cost. People now-a-days know enough about business to understand that dealers must and do make a certain amount of profit on the goods they sell or else couldn't live. The jewelry business is peculiarly one of confidence, and if the public have confidence in the dealer they buy from, they have no hesitation in paying him a fair percentage of profit. In spite of what Mr. McGloghlon says, we think that the fact of his being compelled to give away his profits in order to make sales, if it proves anything at all, proves that he does not enjoy the public confidence as he claims he does. His opponents—who do not make one-tenth of his professions of honesty, ability, and fair dealing—seem to have the confidence of the public all the same, and the public seem to be quite satisfied to pay them a fair profit on their goods. Facts are stubborn things, and their logic is unanswerable. Mr. McGloghlon *may* sell goods at cost, as he claims, and delight in parading the knowledge of the fact, but we claim that such a course is foolish, and suicidal, from a business point of view. If he got the the entire trade of the city on

these terms, he would not be benefitted thereby, but facts go to show that he does not get the whole trade, or even more than his share of it, and that he has kept himself poor by his tactics, without impoverishing his opponents.

Did space permit, we would publish Mr. McLoghlin's circulars, in *extenso*, as we do not think that anything we might say about either himself or his methods of doing business would be half so telling as his own terse and elegant language. We have only room for a few carefully selected gems, as follows, which we have taken from his large circular :

"No dealer can buy less than these quotations. I pay net cash and sell for net cash and give purchasers the benefit."

A philanthropic tradesman surely, doing business purely from charitable motives.

"Beware of the Swiss made watches ; they are only trash, and are palmed off on you for a good article, and are not worth the name of a watch. When you buy a Swiss or cheap English watch you have only trash, and your money is all lost unless you cheat somebody else by selling it."

Indeed ? This will be news to thousands of people in Canada and the States who have carried fine Swiss watches for years and have found them reliable in every particular. All such, please remember that your watch is no good, and you had better pitch it into the ash heap—Mr. McGloghlon says so and it must be so.

Mr. McGloghlon lets us into the secret of his wonderful business success in the following paragraph :

"Reasons why I can supply you with these goods at the prices are : 1—I buy for net cash. 2—I sell for net cash. 3—I am a thoroughly practical watchmaker. 4—I understand my business. 5—I have been in the business 30 years. 6—My expenses are very low. 7—My sales are very large, and although on a single article the profits would not buy a soda biscuit, the quantity sold enables me to live. 8—I am so long and so well acquainted with the people that they, having full confidence, buy promptly and cause me no loss of time. 9—I oversee and do a large portion of my own work. 10—Having all the most modern and best appliances, can execute all work very quickly and perfectly. 11—I do not depend on Tom, Dick and Bob, as many in this city are compelled to do, as they know nothing of the practical details of the trade. 12—Being a practical man I know just what will give satisfaction and thus save any amount of time in tinkering at half-made watches in trying to make them give the customers' satisfaction."

The jewelry trade of this province will please read, mark, learn, and inwardly digest the above. If properly applied, it may keep them from attaining the same kind of business success that Mr. McGloghlon has achieved. But we will hear further from the gentleman himself :

"Watch Repairing.—In this branch I am at home on the cheapest or most intricate mechanism in Stem Winders, Calendars, Chronometers and Stop Watches. If you have a good watch that has been butchered at other places, and there are lots of them, bring it to me and I will make it as good as new, and at a cost that will be satisfactory. It is of great importance that you should know that the person with whom you entrust a good watch is a practical man, and not because he (like several in this city) hangs out a watch sign. Carry your good watch to him and receive it back in ten times worse state than when you handed it to him. If you take your watch to W. D. McGloghlon it will not only be repaired as it ought to be, but any defects will be remedied, and a good watch properly repaired will give satisfaction ; if butchered it will be always a trouble and annoyance. I herewith quote a few of my prices, for which I do first-class work and guarantee perfect satisfaction in every case : Cleaning all ordinary watches, 50 cts.; main-springs, 50 and 75 cts.; very best glasses, 10 cts.; hands, 10 cents each; steel or gilt, second hands, 10 cents; brooch pins, 5 cents each. W. D. McGloghlon is the only watchmaker in the city that does first-class work, and leaves all repairs like new. He is the only watchmaker in the city that has a first-class set of tools. I am the only watchmaker in the Dominion possessing a Transit Instrument for obtaining correct time from the sun. I have the only first-class Regulator in the city, and the only Box Chronometer, so that those requiring correct time can obtain the same at W. D. McGloghlon's within one second. If living at a distance you can send your watch by express for repairs and have it returned at a less price than you can have it butchered at home. I do only first-class work and guarantee satisfaction in every case. It is an admitted fact that W. D. McGloghlon is the only first-class watchmaker in the city, and turns out all repairs like new work."

Great Scott ! but this must be the perfection of a watchmaker. We gaze upon him with feelings of reverence and mentally ask ourselves the question, How can one man possibly know so much ? What sized hat does he wear? We can only think of such a prodigy like Cowper's youth thought of the village schoolmaster :

"And still the wonder grew
That one small head could carry all he knew."

Good-bye, friend McGloghlon, though we cannot see with you, eye to eye, upon the proper way to conduct business, yet we shall ever respect you for your egotism.—*Inserted free of charge.*

Select Matter.

REPAIRING A TIME-PIECE.

TRYING TO FIND OUT WHY A WATCH STOPPED.

HOW THE EXPERTS SHOWED WHAT THEY KNEW AND HOW THE OWNER WAS FINALLY SURPRISED.

"Here is your watch," said the jeweler, as he tore off a small white tag from the ring of a well-worn silver watch and handed the time-piece to a reporter last week. "If it breaks inside of a year you can bring it back and I will fix it for nothing. I don't think it will trouble you though, for it was very thoroughly repaired by one of our best workmen." "I hope not," replied the reporter, as he paid the jeweler $3 and left the store with the watch ticking loudly in his pocket. For nearly a week the watch was a model of regularity, recording the time even to the minute with the great, yellow-faced clock in the City Hall tower. One morning, however, when it was drawn from under his pillow, the reporter discovered to his dismay that the hands were pointing to the hour of two o'clock. It couldn't be afternoon so early in the day. He rubbed his eyes and looked at the dial again. Surely there must be some mistake about it. He examined the hands. They were stationary. He placed it to his ear. It was as silent as a calm. The watch had stopped inside of the first week, and in spite of the three-dollar charge and the year's guarantee. He shook it. A few feeble ticks responded to the jar. The stubby second hand moved slowly about one-quarter around its short circuit and then stopped as before. He pounded it on the bed and made some uncomplimentary remarks about the watchmaker. This evoked another semi-revolution, which was again succeeded by the same silence.

After breakfast the unfortunate owner stepped into the nearest watchmaker's, a seven-by-nine shop, in upper Broadway, and asked the proprietor what was the matter with the watch. The jeweler took the time-piece, pried open the inside cover with a small can-opener, and peered into the works. After a cursory examination he handed it back to the owner. "It needs cleaning," he said.

"Cleaning ?" ejaculated the reporter, in astonishment : "why I paid $3 only last week for having it thoroughly cleaned."

"I can't help that," replied the jeweler ;

"you were very foolish to take such a watch to a second-class workman. The reason it don't run is because it's dirty. The pinions are covered with dust and the oil is all gum. Leave it here and I will fix it for you in good shape. Call again on Saturday and it will be ready. It will only cost you $2.50, and you will then have a watch you can be proud of."

THOROUGHLY DISGUSTED WITH THE WATCH

and the man who had warranted it, the reporter declined the offer, pocketed the time-piece, and left the shop. A few doors below, on the same thoroughfare, a brazen watch with a pair of black hands pointing fixidly to 12.20 swung from a rusty iron bar. The reporter passed under this sign and entered another jewelry store. A fleshy person who was seated at a work-bench facing the window reached for the watch, and proceeded to open it as one would open an oyster. Placing an eyeglass, which resembled a very short telescope, to his eye, he critically examined the movements. After taking observations from every position a watch can be held in, he ventured an opinion that the jewel which covers the encampment pinion was broken. "Yes," said he, after sundry punches in the vital regions of the works with a small steel instrument, such as dentists use, "the jewel is broken. Any man can see that with half an eye. I wonder the watch ran at all. Have you dropped it anywhere?" No? Well, that's strange. I can't be mistaken. The jewel is certainly broken. Leave it with me and I will put in a new one. It will cost you only $5, and call around some day next week. What name please?" The name was not given and the watch was returned.

In the block below a tall street clock indicates the presence of another jewelry establishment, while large show cases, filled with costly trinklets and a brilliant assortment of diamonds and watches in the front windows, attested its claim as a fashionable emporium. The reporter went in there. A languid young man, with a drooping moustache the color of barley straw, took the watch, and after working his way into the movement, placed a small lorgnette to his eye and glanced over the assortment of wheels and pinions and springs which was so numerously and diversely disordered. He remarked: "Your watch is very badly out of repair. The escapement does not seem to be doing its work. The hair-spring is too long. It has too much play. I will cut it off and shorten it." Here he reached for a small instrument to sever the spring, but the reporter interposed. "No," he exclaimed, as he rescued the time-piece; don't cut the spring. I guess that is not what ails the thing for I paid $3 for having it repaired and cleaned only last week, and it ran very nicely until this morning, when it stopped."

"Oh yes," interrupted the young man, "I see; you dropped it and the spring was spread out by the jar. I will undertake to repair it thoroughly for $4, so that you can rely on it. I will give you a guarantee, and if it breaks—"

"The reporter did not remain to hear the rest of the sentence. The watch had all the guarantees it could stand. He had heard by this time so many different opinions upon the condition of the watch that he was determined to learn, if possible, what did ail it. A few blocks down the street another jeweler was found. After several shakes he applied the watch to his left ear and listened attentively. "I think," said he, with a shade of doubt in his voice, "that the main-spring is broken." He then opened the inside case and scrutinized the works carefully. "Yes," he continued, "the main-spring is evidently broken. You must have been very

CARELESS WITH THE WATCH,

and let it fall. No? Well, you have wound it up too tight. That is often as bad as a fall. I will put you in a new one for $2." The offer was not accepted, and the reporter walked out of the shop with his dilapidated chronometer in his pocket, to the great disgust of the jeweler. At the next store a small, nervous man was examining a double row of fly-specked watches, suspended from a small iron rack in the window, and baking in the sun which filtered through the dusty window pane. He took the time-piece and, reaching into a drawer, pulled out a white tag and proceeded to tie it to the ring. "What name?" he asked. "No name," replied the owner; please tell me what is the matter with the watch." With an air of annoyance, the nervous man exposed the works and probed around the balance-wheel with what appeared to the owner to be almost wilful malice. "One of the pinions is bent, the escapement is out of balance, and it needs cleaning; $3, call next Saturday." The owner protested, and the watch was returned.

Having had sufficient experience in Broadway he now visited the Bowery. A large gilt sign over a wide doorway and several suspended clocks and watches, also in gilt, betokened a "jewelry palace," and into it the reporter walked. "What is the matter with the watch?" he asked. The proprietor, an elderly man, took the time-piece, shook it, listened, opened it, gazed into it and shook his head. "Hiram!" he called to a curly-headed young man, who was working at the rear end of the store, cleaning jewelry with a long brush and some white counter. "Vat ish de madder mit dat vatch?" asked the proprietor. Hiram looked at the watch as one would regard a very sore thumb, and shook his head without replying. "Moses!" called the old gentleman to a second young man, younger than Hiram, who came from behind the rear partition. "Moses," said he, "you dell de shentleman vat ish de madder mit his vatch." Moses looked at the poor, miserable time-piece with more solemnity than his brother, and, after sundry lugubrious shakes of his head, responded: "De cap chewel ish owet of blace. It vash growded back of de esgapement. If you try to make it run mitowet gitting it rebaired, you will ruin your vatch. I never saw a vatch so bad as dat. It will only gost you $5."

"I can't leave it to-day," responded the reporter.

"I will gif you a fine job for $4, for $3, for $2, for a dollar and a halluf; and I vouldn't do it von cent sheaper for my grantfadder."

But in spite of the liberality of the offer the reporter pocketed his watch and pursued his search for information. Many other stores were visited and many more jewelers were interviewed. There were seventeen seen in all. Three attributed the stoppage to a broken main-spring, five said it was caused by dirt, three thought that broken jewels made the trouble, two diagnosed it as a case of bent pinions, and the remainder were divided in their opinions, varying from a disordered escapement to a broken tooth in a cog-wheel. Finally, tired of watches and watch-makers, the reporter carried it to the jeweler who had originally repaired it. "There," said he, as he laid

the time-piece on the velvet counter mat, "take this miserable ailing watch. You may keep it or give it away, just as you please. It hasn't a whole wheel in it. The main-spring is broken, the escapement is out of sorts, it wasn't half cleaned, and it is entirely ruined. It will cost me a small fortune to have it repaired. I don't want it any more. It makes me tired to see it around. I'll buy a new dollar-and-a half watch that I can take some comfort in."

The jeweler took the time-piece and retired into the workshop. In a few minutes he returned with a broad smile on his face.

"Here it is, in perfect order. There is nothing the matter with it. You forgot to wind it up last night."

A MYSTERIOUS JEWEL ROBBERY.

Mr. Hengist Skidmore is the younger son of a junior offshoot of an ancient family. The blood that flows in his veins is heraldically very blue, but his fortune when he came of age was exceedingly limited, and was soon spent. A Skidmore cannot condescend to commerce, and therefore Hengist, by a contract of marriage bartered his ancient blood for new riches.

Heraldically Miss Maria Binns never had a grandfather. Her Pa, the late Mr. Thomas Binns, began his career as a miner, but being a clever and plucky man he left the coal pit and the country to seek a fortune. When he was abroad his hand seemed to have a Midas touch. He found gold in Australia, struck oil in America, smuggled opium into China, returned to his native land, worth full £8,000 a year, became a member of Parliament, was venerated as a distinguished philanthropist, lived on the fat of many lands, died in the odour of sanctity, and his daughter Maria inherited his property. The Skidmore blue blood and the Binns new riches met and married. Before being Binns no more the lady insisted upon a settlement, excluding her proposed twain flesh from any share in the control of the property; and the bridegroom-elect being pecuniarily not only off his last legs but also off his last crutch, assented to the hard conditions. Mrs. Skidmore allowed her husband £400 a year, paid quarterly for his personal expenditure, and affectionately congratulated him on her marvellous generosity.

Mr. Skidmore owed a few debts, and his habits were not strictly economical. Unfortunately for him the terms of the marriage settlement were not generally known, and consequently, as the consort of an eight-thousand-per-annum lady, he readily obtained credit from tradesmen, and loans from the accommodating gentlemen who never pay the least regard to the Bank of England *minimum*. Within two years from the auspicious day when he had leased himself for life to the prudent Maria, he was deeply in debt and dreadfully dunned. His courage being spurred by necessity, he ventured to ask his wife for a loan. Her reply proved that although she might love him much, she was still fonder of her property.

"Hengist, I am not a fool, and I would rather put on weeds to-morrow than give you a sixpence more than your liberal allowance."

Mr. Skidmore applied to his friend Captain Kiddell. The name of Arthur Kiddell is not in the Army List or in the Navy List, but he is supposed to have attained military rank in foreign service. In chess he has invented a new gambit. He has, he says, played whist with Imperial Chancellors. Professional billiard players applaud his side stroke. He has, so he avers, won money on the turf. He asserts that he has an infallible system for winning money on the Stock Exchange.

He would be delighted to help Mr. Skidmore. He was at that moment engineering a Stock-Exchange rig that must be a fortune to those who were lucky enough to "be in the swim." If Mr. Skidmore put in £4000 he would take £14,000 of the spoil in less than six weeks. But where, oh where, was the £4,000? Captain Kiddell would have been charmed to lend the money, but he had already overdrawn his account to oblige a noble friend. The Captain claims to be a Napoleon in finance.

"My dear fellow, you say you have nothing, and so can get nothing, but *ex nihilo nihil fit*, is a maxim only fit for greenhorns. You shall borrow the money."

Mr. Chapeau, who lends money on securities that are not negotiable in Lombard Street, agreed to give £4,000 for a £6,000 promissory note, at two months' date.

"Chapeau and his tribe have a tremendous swallow. But, my dear fellow, you will net £10,000 at least, and when you have paid the £2000, you will be £8000 in pocket."

Mr. Chapeau was somewhat fastidious, for a hundreds per cent. per annum lender. He insisted upon Mrs. Skidmore joining in the promissory note. Mr. Skidmore could not even ask her to do so. Captain Kiddell held that a husband had authority to sign his wife's name. Besides, Mrs. Skidmore would not hear of the affair. Chapeau would not part with the note, and it could be paid and burnt in six weeks, a full fortnight before it was due.

Mr. Skidmore had £500 for his immediate wants; Captain Kiddell kindly advancing £500 to make up the £4000 for the infallible rig. Alas! even a Kiddell is not infallible, and for once the 'cute Captain was mistaken. The rig totally failed, and all the invested money was lost.

"My dear fellow," said the Captain, "I have dropt ten thousand, but I shall win on the double-fold venture; for I never go in for mere double or quits. But your fix with the Chapeau note is confoundedly awkward. If your wife won't lend you the money, why not borrow her jewels? Being so cruelly cornered, it is your duty to help yourself."

"The jewels are in the settlement. Kiddell, I am utterly ruined. She will not part with a penny to save me from penal servitude."

"If she had done Arthur Kiddell the honour to take his name in wedlock, she would have been made to part. But, my boy, don't talk about being dry docked. We must weather the storm."

"Chapeau won't wait, and the moment he applies to her, my prosecution will begin."

"The most cruel fix I ever heard of! Oh, the vanity and vexatiousness of women! I suppose the jewels of your wife would pay Chapeau's bill twice over?"

"The jewels are worth over £20,000. But it is no use of talking about her property. In a few weeks a Skidmore will be a convict."

"I will rescue you, my dear fellow. Let us dine, and while we wine discuss my stratagem."

When Mr. Skidmore reached home he was so pale that his wife thought he was ill, and said—

"Hengist, you must see the doctor,

for if you have fever I shall at once leave you and go to Brighton. I have such a dread of fever."

Mr. Skidmore not being stricken with fever, Mrs. Skidmore was not obliged to quit London in the midst of the season. Twice a week she appeared at the opera decorated with nearly all her costly jewels. Among the constant visitors to the Skidmore box were Captain Kiddell and his friend Count Van de Hoeven.

Mrs. Skidmore went to Brighton for a fortnight because she did not feel quite so well as usual. Whenever she visited Brighton her principal jewels, including the diamond necklace, the diamond bracelets, and the superb diamond cluster that decorated her hair, were taken to the bank. She put the jewels into the jewel box and locked it. Her husband locked the jewel-box in an iron box, and attended his wife to deposit the treasure at the bank. No one could charge Mrs. Skidmore with the carelessness that encourages robbery. When she was in town the jewels were kept in an iron safe fixed in her bedroom, that was warranted fire-poor and thief-proof.

If an irresistible force encountered an immoveable mass, what would be the result ? The answer to this school-boy catch problem is that there cannot be an irresistible force if there is an immoveable mass, and *vice versa*. Final or supreme physicial force is at present undiscovered. There is no absolute security for property against those who are resolved to break through and steal. That was the bitter experience of Mrs. Skidmore.

The sojourn at Brighton terminated on Friday afternoon. On Saturday afternoon Mrs Skidmore, attended by her husband, went to the bank and brought home the iron box that contained the jewel case. The lady unlocked the jewel case, glanced at her jewels, relocked the case, put it into the iron safe, and with her own fair hand locked the iron safe. Could fondest mother be more careful of her children than Mrs. Skidmore of her jewels ?

Having been operated upon by her lady's-maid for a full hour, Mrs. Skidmore departed with her husband for Richmond, having been invited by Capt. Kiddell to an early, that is, a five o'clock dinner.

" Now Hengist, be sure to leave instantly after the dinner, for I am determined to be at the opera to-night."

There was a mistake as to the dinner hour. The early repast was for six, not five o'clock. Captain Kiddell's party included Count Van de Hoevan, who proposed a promenade in the grounds.

Mrs. Skidmore was walking with the Count. The Captain took Mr. Skidmore aside.

" Let us light a cigar."

The Captain handed the case to Mr. Skidmore, and then took a cigar himself.

" Look at that little document before we light our cigars."

The document was the promissory note that had been given to Mr. Chapeau. The Captain ignited a wax match and burnt the promissory note.

" There is an end to the perilous bit of paper. Now my boy, let us have a peaceful smoke, whilst the Count amuses Mrs. Skidmore. As for your being in town in time for the opera, that is almost impossible. Punctuality is not one of the virtues of this pleasing place."

It was nearly seven o'clock before the dinner was served, and it was within an hour of midnight when Mrs. Skidmore arrived at her residence.

" I am vexed about the opera, but I not sorry to go to bed. I am so drowsy that I cannot keep my eyes open. I suppose the Richmond air is of the sleepy sort."

Mrs. Skidmore had been dosing during the ride home, and she slept whilst being undressed by her maid. Next day she complained of headache, and remained in her room, but about six o'clock felt better and able to be dressed.

" I am glad that I can go down to dinner, for our guests would be dreadfully dull if I were not present. Norah, I may as well air my jewels to-night."

Mrs. Skidmore took a neat leather case from her pocket, and out of the case a key.

She could not get the key into the lock of the iron safe.

" There is something in the lock. Or else the key is at fault. Norah, ask the master to come to me."

When the maid returned with the master, Mrs. Skidmore was still at the iron safe.

" Is it not strange, Hengist, I cannot get the key into the lock ? You try."

Mr. Skidmore was as unsuccessful as his wife.

" How provoking Hengist. I suppose one of the bolts has slipped, and we shall have to send for the locksmith."

So saying she put her hand on the handle, and behold the door opened.

" I swear I locked it when I went out yesterday. I must have unlocked it without knowing that I did so."

Mrs. Skidmore looked into the safe and screamed. Pulling out some papers, and the iron box used for conveying the jewels to the bank, she yelled with horror.

" My dear, what is the matter ?"

" My jewels, my jewels, my jewels!"

Mr. Skidmore looked into the safe.

" My jewels ! Fool, why don't you do something ?"

" My dear I am so upset that I don't know what to do."

" Go for the police. Go to Scotland Yard. Oh, what shall I do? Oh, my jewels !"

The rage and the terror of Mrs. Skidmore cannot be described. Her magnificent diamond, worth at least £20,000 were gone. The detectives came and examined the safe, and minutely questioned all the servants. Presently they looked at the windows. There was a balcony to the side window, and to one of the girders of the balcony a rope was tied. That indicated the way in which the thief had got in and out of the room. How the thief-proof safe was opened could not be explained. The burglary must have been committed whilst Mrs. Skidmore was at Richmond.

A large reward was offered, and the investigation was directed by Mr. James Burrow, one of our cleverest detectives. After a fortnight there appeared to be a chance of a clue. The pendant to the necklace was a diamond of rather peculiar colour, of large size, and it had a slight flaw. Burrow ascertained that such a diamond was in the hands of a London dealer. The jeweler who had sold the necklace to Mrs. Skidmore identified the stone. Burrow tracked the movements of the stone and found that it had been sent to Holland by a person named Van de Hoevan. But the clue that seemed so promising completely failed. It was proved that the diamond had been in the hands of the dealer and had been offered by him to two leading firms three weeks before the robbery, and Mrs. Skidmore had seen her jewels the very day they were stolen.

THE

JAMES BOSS GOLD WATCH CASE,

is the best protection for the Movement that has ever been put on the market.

IT IS STRONGER, STIFFER, MORE COMPACT AND CLOSER FITTING

than any other, and is the only case containing a

DUST BAND.

This dust band encircles the inside of the case in such a manner as to

Prevent any Dust or Dirt

FROM WORKING INTO THE MOVEMENT

and is the greatest improvement ever adapted to

Watch Cases.

In Finish and Ornamentation the Jas. Boss Case is unapproached. They are sold by all Canadian Wholesale houses.

The Canadian trade will remember that this case is recognized by the Jewelers of the U. S. as the standard, and is the only Filled case that has given entire satisfaction through all time.

"So much for the positive identification of a stone," said Burrow.

Six months passed, and there was no hope, whatever, of recovering the diamonds. Burrow called on Mr. Skidmore.

" Any news now, Burrow ?"

" The diamonds are clean gone, but I think I have found out how the job was done. Would you like to hear my view ?"

Mr. Skidmore had been treated for a nervous disorder, and he was not yet well. His voice was rather tremulous when he replied :—

" Certainly, Mr. Burrow."

Mr. Skidmore turned his face from the detective, and appeared to be closely studying the pattern of the carpet.

" Being on another job, by a half chance I discovered that paste imitations of Mrs. Skidmore's jewels had been made by a Paris house, about two months before the robbery. Also the imitation jewels were put into a case, corresponding in colour and shape with Mrs. Skidmore's jewel case. What do you think of that, sir."

Mr. Skidmore had to clear his throat before he spoke, and still his voice was husky.

" What have paste jewels to do with the stealing of my wife's diamonds ?"

" It is the true clue, Mr. Skidmore, just as the rope tied to the balcony was a false scent. The indentification of the big stone was correct. The genuine diamonds were stolen weeks before the imitations were taken from the iron safe. You are pale, sir, and you are shaking as if you had the ague."

" I am not well. I suffer from nervous attacks."

" I could run in the accomplices. Say, a bill discounter who dusts forged bills, a notorious blackleg gamester, and a foreign party who deals in stolen jewels. But what is the use of running in the accomplices if you mustn't touch the principal ?—especially as not a sixpence of the property can be recovered. I have my eye on the principal, and can show you his photo. There it is, look at it."

With a trembling hand, Mr. Skidmore took the mounted photograph from Burrow. He looked at it, groaned, gasped for breath, and dropt it.

" Dear me, Mr. Skidmore, I have not given you a photo, but a hand mirror. It is your own face that has scared you."

Mr. Burrow put the hand mirror into his pocket.

" It is a queer game, but not new or uncommon. No wonder the detectives are often baffled over these jobs. Good day to you, sir. I think you will now agree with me that to me, as well as to you, the Skidmore jewel robbery is not a mystery."—*Life.*

HOW WATCH CRYSTALS ARE MADE.

Many of our respected readers, although daily handling this unpretentious component of a watch—its crystal, will only be tempted when reading the above headlines into making the inquiry : How are watch crystals made ? We will endeavor to elucidate this subject to the best of our ability, and will invite them to accompany us in a visit in imagination to such a factory.

The work of the celebrated chemist, Piligot, *Glass, its History and Production*, will help us to elucidate the methods and manners of fabrication.

Watch crystals formely where simple spherical segments, and where separated from small glass spheres by means of iron rings red heated in fire. These *calottes* (segments) must necessarily be very arched, to submit sufficient play to the hands. An irregular fracture occurred hereby, and the subsequent attempt of correcting it with imperfect tools often entailed the total loss of the crystal. The rim was then finished upon a disc or grinding wheel.

The invention of the cylinder watch permitted the use of a much flatter crystal, and the defects of the highly arched glass were still more keenly felt. Several Parisian watchmakers manufactured concave glasses for these watches, pressing them of a square piece of flat glass and rounding the rims, which method was imitated in Geneva.

This kind was at first made of a round glass or crystal disc, giving it the necessary height for the motion of the hands; the rim was next corrected, and finally they were cut to correspond to the bezel of the lid. This method of hand production being very expensive, the crystals were very dear ; the watchmakers sold them from three to five francs per piece.

Toward the year 1830, concave crystals called Chevé crystals, were manufactured at Gotzenbruck in a greatly simplified manner, by blowing glass balloons in shape of a bottle with flat bottom, and the latter, when separated, furnished the desired crystal. These bottles were blowned by skilled workmen without the use of a model, and only a scale showed hem the diameter of the piece.

These crystals were also manufactured in like manner in Bohemia. The bottom of the flask was separated while in a hot condition, and received a somewhat heightened rim, which was cut level-shaped to fit it to the case bezel. The making of each crystal requiring a separate flask, the price remained pretty high, in spite of the great speed obtained in there manufacture; they commanded from fifty to sixty francs per gross.

Shortly afterward, the same factory manufactured thicker, so-called double Chevé crystals, which commanded a price of sixty francs per gross, at present only ten to twelve francs. A great improvement in their manufacture has since occurred. Instead of a small flask for each separate glass, with a diamond fastened to a sort of a compass, a number of calottes were cut from a balloon of about fifteen centimeters diameter. The diamond formed the moveable shank of the circle ; the other shank was replaced by a piece of leather or chamois skin, laid upon the glass ball. The shank carrying the diamond could be lengthened or shortened to suit the diameter of the crystal to be furnished. By this fabrication, of 100 blown glass balls, on an average only fifteen could be used for watch crystals; the balance found its way into the wastage.

This method has been very materially improved by the superintendents of said factory, Messrs. A. & T. Dalter, to both of whom the watch crystal manufacture owes its great advancements. The small spherical callottes are at present cut of large balloons, of from 75 to 80 cm. in diameter. From a single one of these spheres, as many as four gross crystals are cut, not to take into account several hundreds of small crystals for Nurnbergian toy watches. About one-half of the spheres may be used at present, instead of 15 of 100, as heretofore.

The progress, together with other further perfectionments made in cutting and polishing the crystals, have gradually lowered their price; ordinary Cheve

SOMETHING NEW IN GOLD CASES

We would call the attention of the Trade to our

10 Karat Gold Cases.

These goods are made in every Style and Size to fit the Waltham Movements, and are manufactured in the following way. The outside, or wearing surface, is 14 karat gold. The inside, or not exposed surface, is 8 karat gold, and when taken together the case will assay 10 karat. Thus possessing every quality of a much higher grade of case, and for Style, Finish and Durability are FAR SUPERIOR TO ANY OTHER THAT IS OFFERED TO THE TRADE AT THE SAME PRICE.

FOR SALE BY ALL LEADING JOBBERS IN CANADA.

Robbins & Appleton,

SOLE AGENTS,

crystals come into commerce at from seven to eight francs per gross, crystals of third choice, intended for export, are sold as low as two francs, fifty cent.; heavy ones cost from ten to twelve francs.

The large spheres, of which we spoke, and which sometimes possess a diameter of one meter, must be blown very thin, since they cannot be thicker than a watch glass, that is from 1 to 1½ mm., either as single or double. The blower's breath is not sufficiently strong to inflate a sphere of such a magnitude, because the glass, in proportion with its expansion and consequent attenuation, also becomes cold, and very rapidly offers great resistance to further expansion; it must be the main object, therefore, to blow the sphere as quickly as possible, while the glass is still hot and yielding.

The following method is pursued at Gotzenbruck: The blower collects six or eight kilog. glass with a pipe of corresponding large dimensions; he then rounds his glass upon a block of soft wood, with assistance of a wooden mallet; at the same time he first blows very gently, and, when the ball appears at the end of the pipe, somewhat stronger, turning the entire mass, that a lengthy glass balloon, in shape of a pear, is produced, and with his tools he gives it the shape of a distended bladder.

This blowing is repeated in the furnace; the workman blows again to increase the circumference; he next makes use of a blowing contrivance propelled by a small machine of three-horse power. The finished sphere is loosened from the pipe, and placed upon a frame. The glass is so thin that it is not necessary to bring it into a cooling furnace in order to cut it.—*Exchange.*

TROUBLES OF A BRIDAL PARTY.

"Say, what kind of a hotel do you keep?" said a green-looking man, as he stepped up to the counter and registered his name, and added, "and wife," after it. "Can a new married couple settle down here for two or three days and have a quiet visit with each other and not be scared out of their boots?"

The hotel man said they could go right to their room and stay there three days or three weeks, and never come to their meals if they didn't want anything to eat. "But what is the matter? Have you been annoyed?" asked the hotel man.

"Annoyed? That doesn't express it. We were married day before yesterday at St. Paul, and went to a hotel. I live about sixty miles west of St. Paul, and the travelling men put up a job to make me tired. There were about a hundred of them snowed in at St. Paul, and I'll be darned if they didn't keep us awake all night. They knew we were a bridal couple, and they bribed the bell-boys and porters to let them act for them, and when we rung the bell for the bell-boy a drummer for a Chicago cigar factory came in and wanted to know what was wanted. I ordered a pitcher of ice-water, and a Milwaukee drummer for a grocery house brought it in, and he looked at my wife, who is bashful, and made her feel real bad. I didn't know they were drummers until the next day, or I should have killed some of them. I rang the bell for coal, and a travelling salesman who posts railroad cards around and works up excursions, he came in and fixed the fire, and he stayed and poked it for half an hour, and he had more gall than I ever see. He asked so many questions about how long we had been married, that I wanted to thump him, but my wife said that we didn't want to have a row the first day we were married. I rang for a chambermaid to clean up the room and bring some towels, and it was about half an hour before she came, and I went down to the office to see about my trunk, and the chambermaid stayed about half and hour and was very interesting, and my wife said she was a real pleasant, affectionate sort of a creature, far above her station, and I tell you I was mad when I found out that it was a smooth-faced, handsome young Jewish drummer for a Milwaukee clothing-house, who was in with the gang, and he gave the chambermaid $3 to loan him an old dress so he could play chambermaid. When my wife told me that the chambermaid patted her on the cheek, and said she was the sweetest bride that was ever in a hotel, and asked for a kiss, and my wife said she thought it would be no harm to kiss a poor chambermaid, and encouraged her, I wanted to kill him, and I went down to the office next morning, but the smooth-faced cuss had gone to Fargo. It was all the landlord could do to hold me. Well, while we were at supper somebody got into the room and put cracker crumbs in our bed, and we found a cold oil-cloth floor mat over the top sheet, enough to freeze anybody. But the worst was at night. We had just got comfortably in bed when there was a knock at the door, and I got up, and the watchman was there, and he said he wanted to point out to me the fire-escape so I could get out in case of fire, and I went out into the hall and he took me way out to the end of the building to show it to me, and while I was looking out of the window my wife came running down the hall and begging me to save her. I asked her what was the matter, and she said as soon as I went out a man that looked like a porter came in the room and told her to fly and save herself, and to follow her husband. She felt awful when she found there was no trouble, and we got back into our room half frozen. I have got them fellows down fine. The fellow who called me out to look at the fire-escape is a drummer for a Philadelphia millinery house, and the one that scared my wife out of her wits travels for a hearse factory at Rochester, N. Y. My wife says she would know him, because he has a big gray moustache, and wears a diamond collar-button in his shirt. She said she thought he was pretty stylish for a porter at the time. They woke us up several times in the night to tell us what to do in case we were sick, and in the morning, before we were up, a waiter brought up our breakfast. He said the landlord sent it up, and he just stood around until we had to sit up in bed and eat breakfast. I thought at the time that it was kind in the landlord to send up our breakfast, but when I found that the waiter who brought it up was a travelling man for a reaper factory at Rockford, and remembered how darned impudent he looked at my wife, I could have murdered him, but the clerk said he had gone to Winnipeg. It was just about as bad coming down here on the sleeping-car, and I think half the passengers on the car were those same drummers that were snowed in. It was colder than Alaska, and I would order extra blankets and they would steal them. I had more than twenty blankets put on the bed, and in the morning there was nothing but a sheet over us. And every time there was a blanket spread over us there was a different porter put it on, and I think they were all travelling men. Every little while somebody would pull open the curtains and sit down on my berth and begin to pull off his boots, and I would tell him the berth was occupied, and that he must have made a mistake,

and he would look around at us as innocent as could be, and ask our pardon, and then go out and damn the porter. Once I felt somebody feeling about my berth, and I asked what was the matter, and the fellow said he was looking for my wife's shoes to black. Then about every fifteen minutes the conductor would open the curtains and hold a red lantern in and ask for our tickets. I think they punched my ticket sixty-five times. Anyway it looked like a porus plaster when I got up in the morning. I think it was the travelling men who were playing conductor, but I was sleepy, and I thought the best way was to let them punch it. Well, about 3 o'clock in the morning somebody punched us and said it was time to get up, as all the passengers were up, and we would have breakfast in fifteen minutes. And then we hustled around and got dressed the best we could, lying on our backs and kicking our clothes up in the air, and catching them on ourselves when they came down. I got my pants on wrong side before and lost everything out of my pockets, and my wife lost her hair and had to tie a handkerchief around her head, and then we had our berths made up and sat up till daylight, and the porter found my wife's hair and pinned it to the curtains of a berth occupied by a preacher from Oshkosh, and he kicked, and got mad and talked about it, and wondered how it came there, and he swore about it, and I think he travels for an Oshkosh carriage factory. O, I never had such a night, or two such nights, in all my life, and what I want to know is if I can be quiet here, and get a little sleep, and not be annoyed."

The hotel man told him if anybody came around to bother him, to knock them clear down stairs and he would be responsible, and the bridegroom took his satchel and his wife, and the colored man showed them a room, and they have not showed up since. It is confounded mean in travelling men to get snowed in and form a syndicate to have fun. They will cause themselves to be disliked if they keep on.—*Peck's Sun.*

Curious Letter Sent by a Quaker to his Watchmaker.—"I send thee once more my erroneous watch, which wants thy speedy care and correction. Since the last time he was at thy school, I find, by experience, he is not benefitted by thy instruction; thou demandest the fourth of a pound sterling, which thou shalt have, but let thy honest endeavours first earn it. I will board him with thee a little longer, and pay for his table if thou requirest. Let thy whole endeavours and observations be upon him, for he has mightily deviated from the principles of truth: I am afraid he is foul in the inward man—I mean his springs. Prove and try him well with thy adjusting tools of truth, that if possible he may be drawn from the error of his ways. By the index of his tongue he is a liar, and the motion of his body is ever variable and uncertain. I presume his body is foul, as I before observed; therefore brush him well with thy cleansing instruments from all pollutions, that he may vibrate with regularity and truth; admonish him friendly and with patience, and be not too hasty and rash with thy correction, lest, by endeavouring to reduce him from one error, thou should'st fling him headlong into another, for he is young and of malleable temper; he may, with due correction, be brought into the path of truth. In fine, let him visit often the motion of the sun, and regulate him by his table of equation; and when thou findest them agree, send him home with thy bill of moderation, to thy friend Tobias Go-well."

THE WATCH.

The word is derived from a Saxon word signifying "to wake." The first watches were about the size of a modern tea saucer; it had weights and was called "the pocket clock." The earliest known use of the modern name occurs in a record made in the year 1542, which mentions that Edward VI., of England, had "onne larum or watch of iron, the case being likewise of iron gilt with two plumettes of lead." The first real adaptation of a timepiece to the pocket was when Peter Hele,in 1550, substituted the spring for weights. The earliest springs were not coiled, but were either straight or slightly curved to suit the shape of the case. Early watches had only one hand, and required winding twice a day. The dials were of metal, generally of silver or brass; they had no crystals in front, and were four or five inches in diameter. A plain watch cost the equivalent of $1,500 in our currency, and when an order was given for one, it took a year to make it.

BUSINESS CHANGES FOR DECEMBER

John Binns, Hardware, Oshawa, dead. T. J. Carroll & Co., Wholesale Jewelers, Hamilton, assigned in trust. Thos. Legalle, Hardware, Essex Centre, sold out. Morn, Jeweler, Trenton, assigned in trust. Joseph Dennison, Jeweler, Huntingdon, dead. John H. McVean, Hardware, Dresden, has taken his brother James H. into partnership under style of McVean & McVean. Carder, Benton & Co., Wholesale Hardware, St. Thomas, assigned. T. Shallcross, Jeweler, Streetsville, selling stock by auction. J. W. Fralick, Tins, &c., Newmarket, assigned.

BUSINESS NOTES.

We understand that Mr. S. P. Kleiser has taken out an auctioneer's liscense, and now plies his new calling on his own and other stocks every evening. It seems to us that such a policy is suicidal to any good watch business, and if Mr. Kleiser does not very soon give up his regular business, it will give him up, if he keeps on at the auctioneering.

Christmas Trade.—Advices from all parts of the country indicate that although the holiday trade has not been quite as good as last year, still is has been fairly up to the general average and much better than many had anticipated. The number of sales appear to have been about as large but the articles not so expensive as in the flush speculation years. We suppose our jewelers should be thankful, however, and say like the clergyman collecting for the missionaries, "Small favors thankfully received, large ones in proportion."

Messrs. Zimmerman, McNaught & Lowe's warehouse narrowly escaped being burned about two weeks ago, on account of a fire breaking out in the up-stairs part of the next building. The fire originated in one of the rooms occupied by Mr. J. R. Hughes, as a paper pattern emporium, and owing to the combustible nature of the stock, spread with dangerous rapidity. After the arrival of the fire brigade the flames were quickly got under control, and the damage to the building will not probably amount to more than $1,000. The principal loss arises as usual from water, the offices below being badly deluged. Messrs. Zimmerman, McNaught & Lowe also got a share of it, although fortunately it came down into their offices instead of amongst the stock, in which case their loss would have been heavy. As it happened their loss would not exceed fifty dollars.

In Shields v. Kleiser, the plaintiff sued for $17.50 the amount paid by him for a gold watch. The action was taken on the strength of a document which guaranteed the chronometer to be a "gold enameled watch," and warranted it to keep good time for five years. Four visits to the defendant's factory failed to make the watch a good timepiece. An expert stated that

this Trade Mark is stamped on all Knives, Forks, Spoons and other flat ware of our manufacture.

The A 1 Goods are Standard Heavy Plate, and XII signifies that in addition the articles have an extra quantity of Silver on all the parts most exposed to wear.

The Meriden Britannia Company have been awarded the highest premiums wherever exhibited, from the WORLD'S FAIR, 1863 to the PRESENT TIME, and the high reputation of our Goods throughout the world has induced other makers to imitate our Trade Marks and name as well as our designs, and as many of our patrons have, through a similarity of names, purchased inferior goods under the impression that they were our manufacture, we are compelled to ask especial attention to our Trade Marks.

THE FACT THAT OUR NAME AND TRADE MARKS ARE BEING SO CLOSELY IMITATED SHOULD BE A SUFFICIENT GUARANTEE TO THE PUBLIC THAT OUR WARES ARE THE BEST IN THE WORLD.

WE RE-PLATE OLD WORK AND MAKE IT EQUAL TO NEW.

although the watch was of the class known to the trade as gold enamelled, it in reality contained but little gold and the composition out of whico the case was composed was barely worth fifty cents per pound. The defendaut held that he never refused to take the watch back, but as another witness contradicted him in this statement the Judge directed Mr. Kleiser to return the plaintiff $17.50 and take the watch back.

Stolen Jewelry Recovered.—We are glad to know that Mr. G. L. Darling, jeweler, of Simcoe, the robbery of whose safe was duly chronicled in last month's Trader, has luckily succeeded in getting back almost the whole of his goods. The story of their recovery is quite romantic, and we think that when its true inwardness is fully explained, it will be seen that justice was not so blind as she is usually made out to be in the arrest of the suspected parties. All we care about saying just now is that we congratulate Mr. Darling on his good luck. The story of the recovery of these goods as told by a local contemporary, runs as follows :

"On Sunday morning the town was thrown into great excitement when word was passed from mouth to mouth that the stolen jewelry was found. The report was generally discredited, but during the day ample confirmation was forthcoming. Speculation was rife, in the absence of any positive information, as to the manner in which the goods had been got hold of. All this was known for certain was that late on Saturday night Mr. Darling had gone to the residence of Mr. G. Bruce Jackson, the lawyer who defended Almond, and who is now looking after Lawlor's case, and had there received his goods, there being, it was said, only some four hundred dollars missing. Some said "Almond has given it up;" others "Lawlor has squealed." Mr. Jackson being waited upon, refused emphatically to give any particulars. He said that he and he alone knew who gave up the goods and no one would ever know anything more than is now known. He, however, denied that Lawlor had squealed and scouted the idea that Almond knew anything about the matter. Neither he nor Adams, Mr. Jackson said, had anything to do in the burglary from first to last. He went on to say that the public were away off in all their surmises, and would never get the real truth. The probability is that Mr. Darling has paid a good round sum as a reward for the restoration of his diamonds, and that he knows no more about the real perpetrator of the burglary than the public—at least, if he does know he will not tell.

WORKSHOP NOTES.

Paste for Cleaning Metals.—1 part oxalic acid, 6 parts rotten stone, mix with equal parts of train oil and spirits of turpentine to a paste.

Soldering German Silver.—Dissolve granulated zinc in spirits of salt, in an earthen vessel. Cleanse the parts to be soldered, and apply the spirits of salts. Next put a piece of pewter solder on the joint, and apply the blowpipe to it. Melt German silver 1 part, and zinc, in thin sheets, 4 parts, then powder it for solder.

An extraordinarily clear and limpid oil for lubricating watches can be procured by pouring upon a bowlful of the best olive oil some melted lead. The bowl should then be set in the sun for two or three months, covered with a pane of glass, when it can be strained and bottled.

A fine and absolutely colorless cement can be obtained by cutting seventy-five grammes of rubber into very small pieces, and putting them in a bottle containing sixty grammes of chloroform, which should then be hermetically corked. When the rubber is completely dissolved, fifteen grammes of mastic in drops should be added, and the bottle again corked tight. The cement will be ready for use in eight days.

To Temper Drills.—Select none but the finest and best steel for your drills. In making them never heat higher than a cherry red, and always hammer till nearly cold. Do all your hammering in one way, for if, after you have flattened your piece out, you attempt to hammer it back to a square or a round, you spoil it. When your drill is in proper shape heat it to a cherry red, and thrust it into a piece of resin, or into quicksilver.

Cement for Fastening Seconds Dials in Watches Better than Tin Solder.—Finely pulverized plaster of Paris (alabaster gypsum) mixed with cabinet-maker's white glue, cold. A little should be spread on the edge of the dial, which should then be quickly pressed into position for ten minutes, when the superfluous cement should be cut off with a brass chisel. In twenty-four hours the cement will be as hard as marble.

Why Boys Dislike to Learn Trades.—The *Blacksmith and Wheelwright* believes that the old system is, in the main, responsible for the aversion that such large numbers of boys manifest for learning trades. For the first year a boy in a blacksmith's shop, for instance, is put to the roughest and most disagreeable work. He is made to do a thousand-and-one things that will be of no use to him when he grows up, and having nothing to do with making him a skilful mechanic. He knows this and naturally rebels and wants to do something that will be of benefit to him. He is brought to feel that to be a good blacksmith, a man requires much brawn and little brains. That he obtains an erroneous idea of the trade he is trying to learn we all know, but, nevertheless, this impression is apt to become fixed in his mind from the character of the work he is put to do. Is it any wonder that he looks with envy on the boy behind the counter, or in a lawyer's office, and longs to get away from an employment which has become irksome ?

A peculiar clock, which marks the hours from one to twenty-four, has recently been completed by a Wilmington manufacturer. The new timepiece is of a kind soon to be adopted by several of the railroads. The most conspicuous innovations are in the marking upon the dial and in the movement of the wheels which run the hands. The minute hand, instead of making twelve revolutions to every revolution of the hour hand, as in the ordinary clock, makes twenty-four revolutions while the hour hand passes around once.

DISCOUNT SALES HUMBUG.

A few days before Christmas, we were waiting in a retail jewelry store in order to have a chat with the proprietor, when we overheard the following conversation between that gentleman and a customer, to whom he was shewing a set of colored gold earrings, in a morocco case :

CUSTOMER.—" Ten dollars you say is the price of these earrings ?"

PROPRIETOR.—" Yes, sir, ten dollars is right."

CUSTOMER.—" Does that include the leather case ?"

" PROPRIETOR.—" Yes, price is for earrings and case, just as you see them, and we regard them as being extra good value."

CUSTOMER.—" Now, look here, I'll give you eight dollars for them, cash."

PROPRIETOR.—" We can't do it, sir, our goods are marked down as low as we can afford to sell them, and our prices are all spot cash."

CUSTOMER.—" Well, but that's only 20 per cent. off your price, and is the regular discount that all the jewelers on King street are giving ; come, now, you can do that if you like ; surely you can afford it just as well as they can. What do you say ?"

" PROPRIETOR.—"Well, I've just to say, that while we want to do business just as much as any other house in the city, we don't want to do it under false pretences. We mark all our goods at a regular rate of profit, which is just as low as we can possibly afford to sell at, and wont admit of us taking off one per cent. discount, let alone 20 per cent. If we were to put on an extra twenty-five or thirty per cent. I suppose we could do the same as those stores you speak of, but we don't think you would be any better pleased if you knew how it was done, or better off if you didn't know how it was done. We don't want to humbug you in any way, and we offer you honest goods at honest prices, which we know you can't beat if you hunt the whole city over."

The young man went out without buying, and the proprietor thought he had wasted half an hour of a very busy day to no purpose. Next day we happened in again, and, curiously enough, while there the same young gentleman came in, and without any parley bought the earrings he had been dickering about the day previous. Now, thought we to ourselves, here is a first-class illustration of the humbuggery of discount sales. Here was a young fellow that had investigated the thing in the light of common sense, and he was apparently willing to sacrifice the advantage of the 20 per cent. discount and pay full price for his goods. Perhaps he was a fool. Well, perhaps he wasn't so much a fool as the discount sales people imagined when he refused to buy their goods. One thing is certain, that firm will never have much trouble in selling that young man again, and when he wants any goods that they have, very little time will be lost in making a bargain.

TARIFF CHANGES.

It is more than probable that the present session of Parliament will witness quite a number of changes in the rate and operation of the present tariff. Until recently it seems that the importers have been viewed by the Government simply as people from whom to extract money, and beyond this they were entitled to, and have actually received little or no consideration. With the Government the interests of the manufacturers seem to have been paramount to any and all other considerations, and the Manufacturers' Association had only to express a wish in order to have it gratified. Now, however, that dull times have caused a shrinkage in the imports and the revenue is likely to show a large falling off, the vigorous protests of importers are beginning to be heard and will probably receive thorough, though tardy, attention. As long as times were good, the Government could afford to ignore these complaints, but now, with dull times staring them in the face, some change must be made, and " Barkis " will now have to be "the friend " of the importer as well as of the manufacturer. If the Minister of Finance desires to make any changes for the benefit of the jewelry and fancy goods' trades, and we trust he does, he can, we think, do them a great deal of service without at all impairing the revenue.

We have always contended that the present rate of duty on jewelry (20 to 25 per cent.) is excessive, and by its excess defeats the very end it was intended to serve, viz. : protection to Canadian manufacturers and a means of raising a larger revenue. Could the present high duty be collected we would consider it a positive advantage to both manufacturer and jobber to have it kept in force ; but unfortunately it is not and cannot be collected alike from all, and its very high rate makes it an incentive to the dishonest trader to smuggle goods which under a low tariff he would never think of attempting. Jewelry differs from nearly all other goods imported, inasmuch as while valuable, it is comparatively small in bulk, and therefore all the more easily secreted and smuggled. Those who know the trade best know that the present high duty is simply an incentive to smugglers and that there are more smuggled goods coming into Canada to-day than there ever was before. This is especially the case with American made goods, which can and are smuggled across in an innumerable number of places along the two thousand mile boundary line that the imagination of the Government has stretched across this continent. Every retail dealer in Canada knows that the country swarms with these itinerant so-called " Jobbers," who unblushingly advance as a reason why they can undersell respectable houses, the fact that they are not fools enough to pay duty on goods that they can so easily smuggle. Of course there is a danger attached to the buying of such goods, or even to having them in one's possession, but there are those to be found who will run this risk in order to make a larger

margin of profit on their sales. It is, we think, a disgrace to a country like Canada, that its legislation should be of such a kind as to have the effect of causing people to break the law instead of upholding it, and that by acting as a premium upon dishonesty it puts it in the power of the unscrupulous trader to undersell his more honest and law-abiding rival.

IS IT HUMBUG?

In the month of December we received a letter from an esteemed correspondent in one or our thriving western towns, enclosing the advertisement of a rival jeweler, which set forth that for a couple of days he would give the benighted inhabitants of the district in which he did business a chance of examining $20,000 worth of stock, which he was prepared to sell them at "a very small advance on cost." Apparently mistrusting that the readers of the paper would credit the statement, he proceeded to tell how he was going to manage the thing, which was in this wise: The wholesale house from whom he bought his goods had, it appears, agreed to be present during the two days in question and allow him to use their stock (presumably to the amount of $20,000) during that time, and to make sales from it as if it were his own. Our correspondent characterizes the whole transaction as a "humbug," and wants us to publicly express our opinion about it, and in a second letter regarding it, seems to feel sore because we did not notice it in our January number. We would have commented upon this in our January issue had we thought that there was anything wrong about it, but we did not then see anything wrong about it, nor do we yet see any reason to change our first impression regarding it. The fact that the wholesale house who lent their goods for the display happens to be one of our advertisers, who would have nothing whatever to do with our action in the premises. If we thought them wrong we would not hesitate one moment to say so, no matter what the consequences might be. Their action, although uncommon, is perfectly right in itself, and is done occasionally by the best houses both in England and the United States. Of course no wholesale house would care about making such a concession to any other than one of their best customers, and it is its very rarity, probably more than anything else, that has made our correspondent regard it in the way he has.

We do not doubt that it may have been hard on his trade if the advertiser carried out his promises, but his only plan, if he couldn't get some other wholesale house to do him a similar turn, would be to grin and bear it. The probability is that he was not a customer of the wholesale house in question at all, and if not, then they did him no injustice. If he was, then his only remedy is to buy his goods from some other firm that will treat all customers alike, and not make fish of one and flesh of another.

A NEW INSOLVENT ACT.

We are glad to know that the Boards of Trade in the cities of Toronto, Montreal and Hamilton have at last become fully alive to the importance of concerted action in regard to securing the passage of an insolvent act. The trouble with Boards of Trade has formerly been, that they did not get to work soon enough, and when they did commence there was no unity of action amongst them. Each separate board had ideas of their own which they wished crystallized into law, and as these were usually brought before parliament while it was sitting, it was no wonder that the Government took the position they did, and virtually said, "Gentlemen, if you don't know what you want yourselves, how can you expect us to bring forward a measure that will suit you all?" This was no doubt a fair argument under the circumstances, and certainly afforded the Government a loophole through which to escape the passing of a law, which they themselves had no desire to pass. Now, however, that the principal Boards of Trade in Canada have met in good season and thoroughly discussed the matter, and laid the result of their deliberations before the Government in time to let them get an idea of the feeling of the country regarding it, we think that it is in a fair way of becoming law. Indeed, we can hardly see how the Government can refuse to pass such a just measure of relief to traders as the proposed law seems to be. They cannot plead that the mercantile community is not agreed upon its advisability, for the draft bill sent them by the Boards of Trade is a unanimous opinion, still less can they plead want of sufficient time to find out the feeling of the country and get such a bill ready, for here is a bill all ready-made to their hand, and in these days of electricity and cheap printing, they can get a concensus of opinion upon it within forty-eight hours, much less the two months that they have had to consider it. Unless the members of the Government are intellectually blind they cannot fail to have noticed how unjust the present chaotic system, or rather want of system, is working. It is prolific of mercantile corruption and knavery, and unless a stop is speedily put to the temptations that beset the hard-pushed merchant, very disastrous results will be apparent in the near future. England has a national bankruptcy act, and the trades of the United States are clamoring for one. Surely Canada, which is not behind either country in intelligence and business sagacity, should be able to have a suitable one also. Such an act is in thorough accord with every instinct and principle of justice, and though its passage has been long delayed, it must come, and that very soon. If it does not it will be bad for credit both at home and abroad.

Since writing the above, we find that no reference has been made in the Governor General's speech to the Bankrupt Act proposed by the Boards of Trade, and a good deal of comment has been made about the omission. It is well-known that the French Canadian members of Parliament are strongly opposed to the passage of such an act, and it is probably for this reason that the Cabinet have not made it a Government measure. Let the Government do as it likes, however, the Bill will be brought forward by some private member and thoroughly discussed, and the members of the Cabinet cannot escape the censure of the mercantile community, if they either refuse to support it or vote against it. In the meantime, we think a special meeting of the Dominion Board of Trade should be held, and their views upon this question, which are certainly entitled to a great deal of weight, should be made known to Parliament before the Bill comes up for discussion.

If, with all this consensus of public opinion, the Government allows the Bill to be defeated, they will, by the estrangement of the mercantile community, certainly have put more than one nail in their political coffin.

Selected Matter.

CHOOSING A PROFESSION.

HOW A YOUNG MAN DECIDED TO BECOME A BURGLAR.

APPRENTICED TO A CLEVER PROFESSIONAL.

When I became eighteen years of age my father, a distinguished begging-letter impostor, said to me: "Reginald, I think it is time that you began to think about choosing a profession."

These were ominous words. Since I left Eton, nearly a year ago, I had spent my time very pleasantly and very idly, and I was sorry to see my long holiday drawing to a close. My father had hoped to have sent me to Cambridge (Cambridge was a tradition in our family,) but business had been very depressed of late, and a sentence of six month's hard labour had considerably straightened my poor father's resources.

It was necessary, highly necessary, that I should choose a calling. With a sigh of resignation I admitted as much.

"If you like," said my father, "I will take you in hand and teach you my profession, and in a few years, perhaps, I may take you into partnership; but, to be candid with you, I doubt whether it is a satisfactory calling for an athletic young fellow like you."

"I don't seem to care about it particularly," said I.

"I'm glad to hear it," said my father. "It's a poor calllng for a young man of spirit. Besides, you will have to grow gray in the service before people will listen to you. It's all very well as a refuge in old age, but a young fellow is likely to make a poor hand at it. Now, I should like to

CONSULT YOUR OWN TASTES

on so important a matter as the choice of a profession. What do you say? The army?"

"No, I don't care for the army."

"Forgery? The bar? Cornish wrecking?"

"Father," said I, "I should like to be a forger, but I write such an infernal hand."

"A regular Eton hand," said he, "not plastic enough for forgery, but you could have a writing-master."

"It's as much as I can do to forge my own name. I don't believe I should ever be able to forge anybody else's.

"Anybody's else you should say, not 'anybody else's.' It's a dreadful barbarism, Eton English."

"No," said I, "I should never make a fortune at it. As to wrecking—why you know how seasick I am."

"You might get over that. Besides, you would deal with wrecks ashore, not wrecks at sea."

"Most of it is done in small boats, I'm told. A deal of small boat work. No, I won't be a wrecker. I think I should like to be a burglar."

"Yes," said my father, considering the subject: "yes, it's

A FINE, MANLY PROFESSION,

but it's dangerous."

"Just dangerous enough to be exciting—no more."

"Well," said my father, "if you have a distinct taste for burglary I'll see what can be done."

My dear father was always prompt with pen and ink. That evening he wrote to his old friend Ferdinand Stoneleigh, a burglar of the highest professional standing, and in a week I was duly and formally articled to him, with a view to ultimate partnership.

I had to work hard under Mr. Stoneleigh. "Burglary is a jealous mistress," said he. "She will tolerate no rivals: she exacts the undivided devotion of her worshipper."

And so I found it. Every morning at 10 o'clock I had to present myself at Stoneleigh's chambers in New Square, Lincoln's Inn, and until 11, I assisted his clerk with the correspondence. At 12, I had to go out prospecting with Stoneleigh, and from 2 to 4 I had to devote to finding out all particulars necessary to a scientific burglary at any given house. At first I did this merely for practice, and with no view to an actual attempt. He would tell me of a house of which he knew the particulars, and order me to ascertain all about it and its inmates—their coming and going, the number of their servants, whether any of them were men, and if so, whether they slept in the basement or not, and other details necessary to be known before a burglary could be safely attempted. Then he would compare my information with his own facts, and compliment or blame me as I might deserve. He was a strict master, but always kind, just and courteous, as became a highly-polished gentleman of the old school. He was one of the last men who habitually wore hessians.

AFTER A YEAR'S PROBATION

I accompanied him on several expeditions and had the happiness to believe that I was of some little use to him. I shot him eventually in the stomach, mistaking him for the master of a house into which we were breaking, (I had mislaid my dark lantern,) and he died on the grand piano. His dying wish was that his compliments might be conveyed to me.

I now set up on my own account, and engaged his poor old clerk, who nearly broke his heart at his late master's funeral. Stoneleigh left no family. His money—about £12,000, invested for the most part in American railways—he left to the society for providing more bishops, and his ledgers, day-books, memoranda, and papers generally, he bequeathed to me.

As the chambers required furnishing, I lost no time in commencing my professional duties. I looked through his books for a suitable house to begin upon, and found the following attractive entry:—

Thurloe Square—No. 102.
House—Medium.
Occupant—John Davis, bachelor.
Age—Eighty-six.
Physical Peculiarities—Very feeble, eccentric, drinks, Evangelical, snores
Servants—Two housemaids, one cook.
Sex—All female.
Particulars of Servants—Pretty housemaid called Rachel, Jewess. Open to attentions. Goes out for beer at nine p. m., snores. Ugly housemaid called Bella, Presbyterian. Open to attentions, snores. Elderly cook, Primitive Methodist. Open to attentions, snores.
Fastenings—Chubb's lock on street door, chain, and bolts. Bars on all basement windows. Practicable approach from third room, ground floor, which is shuttered and barred, but bar has no catch, and can be raised with a table-knife.
Valuable Contents of House—Presentation plate from grateful æsthetes. Gold repeater. Mulready envelope. Two diamond rings. Complete edition of Bradshaw, from 1834 to present time, 588 volumes, bound in limp calf.
General—Mr. Davis sleeps second floor front, servants on third floor. Davis goes to bed at ten. No one on basement, swarms with beetles; otherwise excellent house for purpose.

This seemed to me to be

A CAPITAL HOUSE TO TRY SINGLE-HANDED.

At twelve o'clock that very night I pocketed two crowbars, a bunch of skeleton keys, a centrebit, a dark lantern, a box of silent matches, some putty, a life preserver and a knife, and I set off at once for Thurloe square. I remember that it

snowed heavily. There was at least a foot of snow on the ground, and there was more to come. Poor Stoneleigh's particulars were correct in every detail. I got into the third room on the ground floor without the least difficulty, and made my way to the dining-room. There was the presentation plate, sure enough—about 800 ounces, as I reckoned. I collected this and tied it up so that I could carry it without attracting attention.

Just as I finished I heard a slight cough behind me. I turned and saw a dear old silver-haired gentleman in a dressing-gown in the doorway. The venerable gentleman covered me with a revolver.

My first impulse was to rush at and brain him with a life-preserver.

"Don't move," he said, "or you're a dead man."

A rather silly remark to the effect that if I did move it would rather prove that I was a live man occurred to me, but I dismissed it at once as being unsuited to the business character of the interview.

"You're a burglar," said he.

"I have that honour," said I, making for my pistol pocket.

"Don't move," said he: "I have often wished to have the pleasure of encountering a burglar, in order to be able to test a favourite theory of mine as to how persons of that class should be dealt with. But you musn't move."

I replied that I should be happy to assist him, if I could do so consistently with a due regard to my own safety.

"Promise me," said I, "that you will allow me

TO LEAVE THE HOUSE UNMOLESTED

when your experiment is at an end?"

"If you will obey me promptly you shall be at liberty to leave the house."

"You will neither give me into custody nor take any steps to pursue me?"

"On my honour as a designer of Dados," said he.

"Good," said I. "Go on."

"Stand up," said he, "and stretch out your arms at right angles with your body."

"Suppose I don't?" said I.

"I send a bullet through your left ear," said he.

"But permit me to observe—"

Bang. A ball cut off the lobe of my left ear.

The ear smarted and I should like to have attended to it, but under the circumstances, I thought it best to comply with the whimsical old gentleman's wishes.

"Very good," said he. "Now, do as I tell you, promptly and without a moment's hesitation, or I'll cut off the lobe of your right ear. Throw me that life preserver."

"But—"

"Ah, would you?" said he, cocking the revolver.

The "click" decided me. Besides the old gentleman's eccentricity amused me, and I was curious to see how far it would carry him. So I tossed my life preserver to him. He caught it neatly.

"Now take off your coat and throw it to me."

I took off my coat and threw it to him diagonally across the room.

"Now the waistcoat."

I threw the waistcoat to him.

"Boots," said he.

"They are shoes," said I in some trepidation, lest he should take offence when no offence was really intended.

"Shoes, then," said he.

I threw my shoes to him.

"Trousers," said he.

"Come, come, I say," exclaimed I.

Bang! The lobe of my other ear came off. With all his eccentricity the old gentleman was a man of his word. He had the trousers and with them my revolver, which happened to be in my right hand pocket.

"Now the rest of your drapery."

I threw him the rest of my drapery. He tied up my clothes in a table-cloth, and, telling me that he wouldn't detain me any longer, made for the door with the bundle under his arm.

"Stop!" said I; "what is to become of me?"

"Really, I don't know," said he.

"You promised me my liberty," said I.

"Certainly," said he. "Don't let me trespass any further on your time. You will

FIND THE STREET DOOR OPEN;

or, if from force of habit you prefer the window, you will have no difficulty in clearing the area railings."

"But I can't go like this; won't you give me something to put on?"

"No," said he, "nothing at all; good night."

The quaint old man left the room with my bundle. I went after him, but I found that he had locked an inner door that led upstairs. The position was really a difficult one to deal with. I couldn't possibly go into the street as I was, and if I remained I should certainly be given into custody in the morning, for some time I looked in vain for something to cover myself with. The hats and great-coats were no doubt in the inner hall; at all events they were not accessible under the circumstances. There was a carpet on the floor, but it was fitted to the recesses of the room, and, moreover, a heavy sideboad stood on it.

However, there were 12 chairs in the room, and it was with no little pleasure that I found that on the back of each was an antimacassar. Twelve antimacassars would go a good deal towards covering me, and that was something.

I did my best with the antimacassars, but on reflection I came to the conclusion that they would not help me very much. They certainly covered me; but a gentleman walking through South Kensington at 3 a.m.

DRESSED IN NOTHING WHATEVER BUT ANTIMACASSARS,

with the snow two feet deep on the ground, would be sure to attract attention. I might pretend I was doing it for a wager, but who would believe me?

I grew very cold.

I looked out of the window, and presently I saw the bull's eye of a policeman who was wearily plodding his way through the snow. I felt that my only course was to surrender to him.

"Policeman," said I from the window, "one word."

"Anything wrong, sir?" said he.

"I have been committing a burglary in this house, and I shall feel deeply obliged to you if you will kindly take me into custody."

"Nonsense, sir!" said he; "you'd better go to bed."

"There is nothing I should like better, but I live in Lincoln's Inn, and I have nothing on but antimacassars: I am almost frozen. Pray take me into custody."

"The street door's open?" said he.

"Yes," said I. "Come in."

He came in. I explained the circumstances to him and with great difficulty I convinced him that I was in earnest. The good fellow put his great coat over me, and lent me his own hand-cuffs. In ten minutes I was thawing out myself in Walton street police station. In ten days I was convicted at the Old Bailey. In ten years I returned from penal servitude.

I found that poor Mr. Davis had gone

to his long home in Brompton Cemetery.

For many years I never passed his house without a shudder at the terrible hours I spent in it as his guest. I have have often tried to forget the incident I have just been relating, and for a long time I tried in vain. Perseverance however, met with its reward. I continued to try. Gradually one detail after another slipped from my recollection, and one lovely evening last May I found to my intense delight that I had absolutely forgotten all about it."

WOOD CARVING IN SWITZERLAND.

A Geneva correspondent of the *London Daily News* writes: Next to its admirable communal system and the thrift of its people, the prosperity of Switzerland is in a great measure due to the efforts that are being constantly put forth to supplement agriculture by industry. Where the soil is fertile and the climate genial, agriculture can stand alone, and the peasantry, though their holdings may be small, are generally well-to-do. But in mountainous regions, such as the Jura and Bernese Oberland, families possessing no more than ten or fifteen acres of not very rich land, and with no other resources than husbandry, find it hard to live; for the Swiss, unlike their French neighbors, are prone to indulge in the luxury of large families. It is a suggestive fact that while the Vaudois and the Neufchatelois are little given to emigration, the emigration from some parts is so extensive as to threaten them with depopulation. This arises from no difference in the laws or social conditions prevalent in the three cantons, but from the circumstance that for generations past the mountaineers of the Jura have combined handiwork with husbandry, while, with few exceptions, the mountaineers of Oberland have put their trust in husbandry alone. Despite the difficulty of creating new trades in a country destitute of coal and iron, and hemmed in by hostile tariffs, the Bernese began some years since to emulate the example of their neighbors, and their efforts, to all appearance, are likely to be crowned with success. These efforts are directed chiefly to the development of what may be called the natural industries of the canton, such as wood carving, marqueterie making, and the production of artistic furniture.

The first attempt to introduce wood carving into Berne was made half a century ago by Christian Fischer, of Brienz, who may be called the father of the art; for, after acquiring it himself, he taught it to others and founded a school. Besides being an artist in wood, Fischer taught music, made musical boxes, and practiced the healing art; but, like many other clever fellows, he died in poverty. Some time after Fischer began wood carving at Brienz, a certain Peter Baumann began at Grindelwald the making of the miniature Swiss chalets which are now so popular. He afterward removed to Meyringen, where he taught his art to his three sons, one of whom Andreas, proved to be a genius of the first order, and was equally distinguished for originality of design and skill in execution. He was the first to practice carving in relief. His roses are still regarded as masterpieces, and serve as models for young sculptors. The success of the Baumanns encouraged others to follow their example, and wood carving soon became a winter occupation in nearly every cottage of the valley of the Hasli. But the sale of carvings and chalets being restricted to foreign tourists in the summer season, principally through the intermediary of hotel porters, the trade for a long while was limited and unremunerative. But it struggled on, and in the course of time attracted the attention of local capitalists, who started workshops, opened depots for the sale of their products, and began an export trade which, with some fluctuations, goes on steadily increasing. The business of wood carving now finds employment for several thousands individuals. In one establishment alone—that of the Brothers Worth—three or four hundred sculptors of both sexes are regularly occupied. Each has his or her specialty, the choice of which is left to individual taste. Some have an aptitude for, and excel in the modeling of groups of animals; others, again, prefer to carve ornamental caskets and build miniature chalets. The women have great delicacy of touch, and their work in certain branches is preferred to that of the men. One thing leads to another, and the abundance of certain sorts of wood in the district suggested the idea of adding to wood carving the production of kin rings and such like articles. A factory has also been started at Interlaken, and is now in successful operation for making habitable chalets on a large scale. You have only to select your design, give the order, and all the parts of a chalet are sent to any destination, so arranged and marked that an intelligent joiner can put them together, and you have a handsome and picturesque house which you may live in as long as you like, and even carry about on your travels.

Another trade which has lately sprung up in the Bernese Oberland is the making of slabs, table-tops, and other articles from the indigenious marbles and granites of the district. A beautiful red stone, soft at first, but which on exposure to the air becomes as hard as adamant, is extensively used for these purposes, and when artistically inlaid with black and white marble, is much sought by amateurs of marqueterie. Parqueterie is also becoming an extensive manufacture. The quantity turned out annually is estimated at 700,000 square feet, and the value of the wood carvings executed by the sculptors of the Oberland reaches a yearly total of 2,000,000 francs. The number of artisans engaged in the trade is 25,000, and their earnings range from two to five francs per day. The headquarters of the trade are Brienz, in the district of Interlaken, and Meyringen, in the district of Oberhasli; but many of the people work at their own homes in remote valleys. At Brienz there is an excellent school of design, supported partly by the communes and partly by the canton; and the sculptors of Interlaken enjoy the services of a "modeller," paid by the state. These industries have already done much to promote the prosperity of the districts in which they are carried on, and if they make the same progress in the future as they have in the past they will soon take rank with the important special trades of the confederation. If similar, or some other special manufactures could be organized in Ireland, the everlasting Irish difficulty, which has its root in the poverty of the people, would probably be robbed of its worst terrors. And there is no reason in the nature of things why special trades should not flourish in Ireland as they flourish in Switzerland. Neither country is gifted with mineral treasures, but Ireland possesses advantages that Switzerland lacks and would give much to obtain—seaports, navigable rivers, and ready access to one of the most extensive markets in the world, which levies no duties on her products, and where they find a ready sale.—*Ex.*

THE

JAMES BOSS GOLD WATCH CASE,

is the best protection for the Movement that has ever been put on the market.

IT IS STRONGER, STIFFER, MORE COMPACT AND CLSOER FITTING

than any other, and is the only case containing a

DUST BAND.

This dust band encircles the inside of the case in such a manner as to

Prevent any Dust or Dirt

FROM WORKING INTO THE MOVEMENT

and is the greatest improvement ever adapted to

Watch Cases.

In Finish and Ornamentation the Jas. Boss Case is unapproached. They are sold by all Canadian Wholesale houses.

The Canadian trade will remember that this case is recognized by the Jewelers of the U. S. as the standard, and is the only Filled case that has given entire satisfaction through all time.

THE "LITTLE MESTER."

Is the venerable institution known in Sheffield as the "Little Mester" fading out of existence? The question is interesting, though it hardly reaches the dignity of importance, for in practical life men and things lose importance in exact proportion as they lose power. If it be true, as is currently believed, that the "little mester" is being pushed from his stool by the ever-broadening shoulders of the large manufacturer, persons with a taste for antiquarian matters will welcome him as an acquisition, and will fondle his remains; but his decline will hardly dislocate any scrap of mechanism in the great practical world, which never looks back. The extinction, if it be really threatened, is bound to be tentative and gradual; and when the last forge shall be put out and the last manufacturing irregular has been gathered into the ranks of organized labour, the industrial fabric will scarcely feel any vibration from the shock of dissolution. There can be no doubt, we think, that for good or for evil this process of obsorption is going on, and that in a few years the "little mester" of the cutlery and hardware trades will be little more than an historical object. Without attaching under weight to what we see in other directions, or to the general tendency in large concerns to play the part of Aaron's serpent, there is undoubtedly a fundamental disposition in modern existence to fuse and merge common interests in order the better to fight a common battle. For this purpose the lion may often lie down with a lamb, though in this case we are bound to say that the lamb is "inside the lion." The special difficulties with the "little mester" of the cutlery trade has had to face of late years have been great. Foreign competition, labour-saving machinery, and erratic demand may be named as the chief factors in this discomfiture; and perhaps the last is the worst. For years the great backbone upon which the "little mester" relied for his trade was the American market, which then poured forth its orders into the lap of Sheffield without reserve. American work was then comparatively safe stock, and em ployment was consistently good or uniformly poor, according to the height of the commerical tide. Since then the Transatlantic orders have undergone a prodigious change both in character and in bulk. We no longer get them in indiscriminate profusion, nor do we get more than a respectable proportion of the whole. Roughly the trade may be divided into three classes—best, medium and common. Of these the best, no doubt, go to Sheffield, but they are placed with the great houses there. The second class are chiefly supplied by native producers, and the third by Germany. We can count upon our fingers nearly a dozen Sheffield houses, alive and dead, which have dropped out of the American trade within the last twelve years, and which, in so disappearing, having left scores of pendant "little mesters" in the lurch. Such American orders as the "little mester" browses upon now come to him in a harrassing, hectic flush, lasting a month or two and leaving him high and dry for three or four more. This desolate hiatus tells heavily on his financial resources. He cannot keep his men together; they go to the surer employment of the larger houses. He is afraid to employ himself on approved patterns for the same reason that the merchant who feeds him hesitates to give him speculative work, viz., that American buyers are as fickle as the wind in their choice. There are other reasons for the decay of this ancient representative of the cutlery trade, which we have not space to exhaust; but two may be mentioned—the scarcity of juvenile labour, consequent on educational requirements and the attraction of higher wages elsewhere, and the practice followed by some 'cute direct. buyers of penetrating the lair of the "little mester" for their own profit.—*The Ironmonger.*

A DIAMOND THIEF.

A CLEVER THEFT AND HOW IT WAS DISCOVERED.

An old horse-car conductor, telling a Chicago reporter of his experience with thieves on his cars, mentioned the case of "Dandy Ben," a well known pick-pocket, whom he had arrested one day after a lady passenger had discovered the loss of a valuable diamond earring. "He was searched," said the conductor, "from the crown of his hat to the sole of his boots, but

THE DIAMOND WAS NOT DISCOVERED.

It was not on his person, I was beat; and when Dandy Ben sarcastically asked me if I was satisfied, I told him I was. 'Well, then I am not,' he said; 'you will hear from me again." And taking a note-book from his pocket, he cooly took down the number of my car and stepped off. The car was again searched for the earring, but in vain, and the unhappy lady who had lost it was inconsolable."

"Was it never found?"

"Yes, One morning, a few days after the event, I was loitering about the car-barn, having a half hour between trips. The only other person around was the foreman of the barn, and he stood in one of the wide-open doors, when a shabby, rusty, dilapidated old tramp came limping along, looking as forlorn and wretched as the last rose of summer. It was a cold morning, and the old fellow sidled up to the door, and then suddenly whisked inside to escape a fiercer gust of wind than usual. With a rather fatigued air he asked the foreman's permission to sit down in one of the cars, where he could rest and be out of the wind for a few minutes. He seemed so harmless and tired and cold that the foreman consented, and the old chap shuffled along into the barn. He passed three or four cars, looking at the number of each, before he finally clambered into one and sat down in a corner. I noticed this, but not with surprise, for I had recognized the man. I don't know how I

PENETRATED HIS DISGUISE

so readily, but the minute I laid eyes on that old tramp I knew it was Dandy Ben. He didn't seem to notice me, or, if he did, he doubtless thought his disguise was all-sufficient. I wondered what new game the rascal was up to now, and concluded to do a little watching on my own hook without imparting the secret of my discovery to the foreman. I sauntered to and fro for several minutes, trying to decide the best course to pursue to find out the trickster's game; then, all of a sudden, a thought struck me. Without any further hesitation I walked directly and rapidly to the car door which the tramp had entered, jerked open the door and stepped inside. While doing this I caught the sound of a hurried movement on the part of the occupant of the car, and by the time I got my eyes on him he was leaning back in his corner feigning asleep. But he had not had time to put out of sight a chisel and a small saw which were only partially concealed beneath his coat. The sight of these tools confirmed my suspicion. I caught

SOMETHING NEW IN GOLD CASES

We would call the attention of the Trade to our

10 Karat Gold Cases.

These goods are manufactured by the American Watch Co. of Waltham, Mass., and are made in every Style and Size to fit the Waltham Movements. The outside, or wearing surface, is 14 karat gold. The inside, or not exposed surface, is 8 karat gold, and when taken together the case will assay 10 karat. Thus possessing every quality of a much higher grade of case, and for Style, Finish and Durability are FAR SUPERIOR TO ANY OTHER THAT IS OFFERED TO THE TRADE AT THE SAME PRICE.

FOR SALE BY ALL LEADING JOBBERS IN CANADA.

Robbins & Appleton,

SOLE AGENTS,

New York. Boston. Chicago. London, E. Sidney, N.S.W.

the rogue by the collar and jerked him out of the corner, at the same time calling to the foreman, who came to my assistance. In another minute Dandy Ben was our prisoner. And what do you think he had been doing? With his chisel and saw he had been cutting a hole through a panel in the back of a seat directly under the window. I knew instinctively what he was after, and we lost no time in finishing the work he had begun. Groping in the aperture I found what I expected to find—the missing diamond earring. This explained the thief's real object in taking the number of my car that day. He had stolen the diamond out of the woman's ear, but as she missed it before he could leave the car he knew his only course was to get rid of it. As he had no pal with him, he dropped the jewel down the crevice into which the window slides when it is lowered, hoping to be able to recover it at some future time. He came very near succeeding, too, but a miss is as good as a mile, tbey say. I suppose the lady thought so when she got back her diamond."—*Exchange.*

BUSINESS CHANGES FOR JANUARY.

Zimmerman, McNaught & Lowe, Wholesale Jewelers, Toronto, dissolved, J. Zimmerman, retiring. W. K. McNaught & W. G. H. Lowe continue the business under the style of McNaught & Lowe. N. Turner & Son, Hardware, Cornwall, Ont., burned out. Wm. Robertson & Co., Hardware, Seaforth, sold out to Reid & Wilson. E. A. Serby, Jeweler, Glencoe, Ont., stock sold by the Sheriff. James Ferres & Co., Hardware, Hamilton, assigned in trust. J. Welsh, Jeweler, Preston, Ont,, assigned in trust. J. Mason, Jeweler, Essex Centre, Ont., removed to Brantford. M. Sancier, Jeweler, Toronto, admitted E. Fox into the business, style now Fox & Sancier. Duquet & Dalaire, Jewelers, Quebec, dissolved; business continued by Louis Dalaire. Chown & Cunningham, Hardware, Kingston, dissolved, E. Chown continuing. W. H. Manning, Hardware, Coldwater, burned out. Hatch Bros., Hardware, Toronto and Whitby, dissolved. Crompton & Burnett, Jewelers, Emerson, Man., giving up business.

BUSINESS NOTES.

Our readers will see by the advertisement on the back page of this issue, that the firm of Zimmerman, McNaught & Lowe, which has for the past seven years so successfully carried on the wholesale jewelry business has recently been dissolved by mutual consent, Mr. Zimmerman retiring on acount of ill health. We are glad to know, however, that this will make no difference to the business as the other members of the firm will carry it on as before. This firm have, by energetic and honest dealing, built up one of the largest wholesale jewelry businesses in Canada, and we trust that its future success may be even more pronounced and satisfactory than the past.

In July last A. E. Serby began business in Glencoe as a jeweler, but with little capital. In so short a time as six months he has been compelled to assign.

A writer of mathematical bent finds from the census returns that there are about 17,000 dentists in the United States, who, he estimates, pack into the teeth of the American people a ton of pure gold annually. He predicts that in the twenty-first century all the gold in the country will be buried in the graveyards.

New Form for a Promissory Note.—Andrew Jackson, a Seneca Indian, who could write a little and only a little, borrowed $2.50 from John Halftown, and gave him his note for the money with interest. It ran like this: "Me, Andrew Jackson, day after to-morrow six months, will pay to John Halftown, maybee three or four days, $3 or $4 dollars, no fetch paper no get money, by dam."

A Token of Respect.—Mr. W. Frank Ross, who has charge of the watch manufacturing and repairing department in Messrs. Kent Bros.' jewelers' store, Toronto, was agreeably surprised on Christmas Eve at being presented by the employes of the firm with an elegant pair of gold cuff buttons, bearing a raised monogram, as a token of their respect for him. Mr. Ross by his kindly and courteous manner has not only gained the esteem of the employes but of all those who have occasion to do business with him.

A Year's Failures in Canada.—The failures of 1883 in the Dominion of Canada, as reported by Dun, Wiman & Co., number 1384, with liabilities amounting to nearly $16,000,000. The failures are divided as follows:

Province.	*Failures.*	*Liabilities.*
Ontario	567	$4,700,000
Quebec	438	6,400,000
New Brunswick	48	747,000
Nova Scotia	89	1,068,000
Newfoundland	5	48,000
Prince Edward Island	5	40,000
Manitoba	232	2,869,000

As compared with the United States, the showing for Canada is not very encouraging; while in the United States there has been one failure in every 94 traders, in Canada there has been one in every 48 traders. The average of liabilities in the United States has been $18,000, while in Canada the average has been $11,000.

A case which will no doubt be of interest to all merchants who expose goods for sale or show in glass cases outside their door, was tried in Toronto lately. The particulars are as follows: About the middle of October last, Mr. James F. McLaughlin was driving along Adelaide street west in a covered buggy, when his horse took fright at a man climbing a telegraph pole and bolted. Before Mr. McLaughlin could reduce his steed to subjection it dashed against a small glass case, fixed on an iron column, at the Adelaide street side of Tasker & Son's store. The case was badly smashed, and the watches which it contained were scattered promiscuously around the street. When the horse was subdued Tasker asked McLaughlin to come into the store and settle the bill of damages. McLaughlin went in, but as Tasker could not immediately appropriate the damages, McLaughlin, after stating that if business engagements would permit he would call again. He did not call. Mr. Tasker sent after him, but was requested to visit McLaughlin at his office, when they would talk the matter over. Tasker then entered the present suit, in which he claims $50 as the amount of damage. In his evidence Tasker stated that he believed the defendant had purposely turned his horse across the sidewalk into his show case, in order to prevent its continuing the flight along Adelaide street. The defendant denied this assertion, and said that the animal was for the moment uncontrollable. The horse acted wholly on its own volition, and was not guided by him. A number of expert witnesses gave evidence as to the value of the five watches damaged, and one witness offered to purchase the five watches for $3 each. The defence also endeavoured to prove that the show case projected over the sidewalk and occupied this position in deiance of the city by-law. His Honour, however, held that this fact was not established. After hearing precedents cited, the court stated that there really was no evidence to prove that the defendant had been guilty of negligence. Had a man on the sidewalk been injured by a runaway animal, there would have been no ground for an action against the defendant, and he was certain that in this an action would not stand. He therefore entered a verdict for defendant.

WORKSHOP NOTES.

Fluoric Acid.—You can make your own fluoric (sometimes called hydro-fluoric) acid, by getting the fluor, or Derbyshire spar, pulverizing it, and putting all of it into sulphuric acid, which the acid will cut or dissolve. Inasmuch as fluoric acid is destructive to glass, it cannot be kept in common bottles, but must be kept in lead or gutta percha bottles.

To Separate Gold from Silver. — The alloy is to be melted and poured from a height into a vessel of cold water, to which a rotary motion is imparted. By this means the alloy is reduced to a finely granular condition. The metallic substance is then treated with nitric acid, and gently heated. Nitrate of silver is produced, which can be reduced to any of the known methods; while metallic gold remains as a black mud, which must be washed and smelted.

To Drill and Ornament Glass.—Glass can be easily drilled by a steel drill, hardened but not drawn, and driven at a high velocity. Holes of any size, from the sixteenth of an inch upward, can be drilled, by using spirits of turpentine as a drip; and, easier still, by using camphor with the turpentine. Do not press the glass very hard against the drill. If you require to ornament glass by turning in a lathe, use a good mill file, and the turpentine and camphor drip, and you will find it an easy matter to produce any shape you choose.

Dead White on Silver Articles.—Heat the articles to a cherry-red, or a dull red heat, and allow it to cool, then place it in a pickle of 5 parts sulphuric acid to 100 parts of water, and allow it to remain for an hour or two. If

the surface is not right, rinse in cold water, and repeat the heating and pickling as before. This removes the copper from the surface of the article, leaving pure silver on the surface. When sufficiently whitened, remove from the pickle, well rinse in pure hot water, and place in warm box sawdust.

To Recover the Gold Lost in Coloring. —Dissolve a handful of sulphate of iron in boiling water, then add this to your "color" fluid, it precipitates the small particles of gold. Now draw off the fluid, being very careful not to disturb the auriferous sediment at the bottom. Then proceed to wash the sediment from all trace of acid with plenty of boiling water; it will require 3 or 4 separate washings, with sufficient time between each to allow the water to cool and the sediment to settle, before pourthe the water off. Then dry in an iron vessel by the fire, and finally fuse.

Molding-Sand for Brass or Iron. — The various kinds of good molding-sand employed for casting iron or brass have been found to be almost uniform in chemical composition, varying in grain or the aggregate form only. It contains between 93 and 96 parts silex, or grains of sand, and from 4 to 6 parts clay, and a little oxide of iron, in each 100 parts. Molding-sand which contains lime, magnesia, and other oxides of metals is unfit for use, particularly for the casting of iron or brass. Such sand is either too close, will not stand or retain its form, or will permit the metal to boil through its closeness.

Correct Length of Lever, Etc.—It is quite frequently necessary to determine the correct length of the lever, size of table roller, size of the pallets and depth of the escapement of lever watches. A lever from the guard pin to the pallet staff, should correspond in length with twice the diameter of the ruby pin table and if such a table is accidentally lost, its correct size may be known by measuring half the lever between the points above named. For correct size of pallet, the clear space between the pallets should correspond with the outside measure on the points of three teeth on the scape wheel. The only rule that can be given without the use of diagrams, for correct depth of the escapement, is to set it as close as it will bear, and still free itself perfectly, when in motion. This may be done by first placing the escapement into your depthing tool, and then setting it to the correct depth. Then by measuring the distance between the pivots of the lever staff and scape wheel, as now set, and the corresponding pivot holes in the watch, you determine correctly how much the depth of the escapement requires to be altered.

OTHER NOTES.

In spite of the so-called dull times, remittances from retail merchants are very satisfactory, and indicate that if they are not inclined to buy as freely as usual, they are at least paying as promptly. It is a good sign and speaks well for the business sagacity of the jewelry trade.

The American Society of Civil Engineers approves the plan of so dividing the time as to mark the twenty-four hours of the day upon watches and clocks. It declares that the cost of the change in dials will be small, and the advantage of the change of great practical use in simplifying matters that are now complicated by "ante meridian" and "post meridian" computations.

The signer of a note given for a "future" in cotton has successfully resisted payment of it in the Georgia Supreme Court, under a statute declaring that all contracts and evidences of debt upon a gambling consideration are void *in the hands of any person*. The court held that cotton futures are gambling and nothing else. The opinion says emphatically, "Betting on the game of faro, brag or poker cannot be more hazardous, dangerous or uncertain. Indeed, it may be said that these animals are tame, gentle and submissive, compared to this monster. The law has caged them and driven them to their dens.

A scientific jeweler says that fine, sensitive watches are particularly liable to be affected by electrical atmospheric disturbances. During the months of June, July, and August, when these phenomena are most frequent, there are more main-springs broken than during all the remaining months of the year. They break in a variety of ways, sometimes snapping into many pieces. It is also said that since the introduction of the electric light has become so general a large number of watches—some of them very fine ones—have been magnetized. While in this condition they are useless as time-keepers.

The telephone, like the telegraph, is contributing to new departments of law and legal practice. Under a law which makes it a misdemeanor to send false communications by telegraph or telephone line, an expelled member of the St. Louis, Mo., Hackmen's Association has been arrested, charged with having an order sent by telephone, causing sundry other members of the Association to send carriages on wild goose chases in different parts of the city. The case is the first of its kind, and considerable interest is taken in the result. The punishment for such false messages is a fine of not more than $100, with a liability to a civil suit for damages.

One of the representatives of Messrs. Greenshields, Son & Co. writes to the *Monetary Times* from Dublin, Ont., as follows:—

"Having been snow bound in this thriving village for a few days on my western trip, a novel device, and yet a nice, mild way to put it, as a reminder to customers who have not paid their accounts, may have been seen hanging in Jos. Kidd & Son's. office: A large morocco purse hung on the wall, *open*, with a printed card at the mouth, inscribed, '*Our purse is empty.*' I send you this item as a matter of news, and also as a good example for other merchants to follow."

The production of iron, in Great Britain, has been greatly overdone. From 13,320,000 tons, in 1876, to 21,100,000 tons in 1882, is the increase. The demand not having kept pace with production, the market is glutted. There is a shrinkage of price in the States, pigs went down during the last year, from $3 to $4 and steel rails $5 a ton. The fires of many rolling mills and steel works have ceased to burn. Failures in the iron trade in England are numerous; ten having taken place a few days previous to the 1st January. Neither Free Trade nor Protection can enable producers to gauge the demand every year; mistakes are made and not alone those who make them suffer, but also their connections and dependents.

If you are a merchant, study to please the person you expect will buy your goods; study the golden rule of square dealing; study system and study the price-lists of an independent mercantile paper. Of course success will not always attend every effort made. The location you have selected may not be one where a satisfactory business can be done. But one thing, says an exchange, may be depended on, viz.: "You cannot put your goods helter skelter on your shelves and counters, and then sit down and expect the dollars to roll into your money drawer, any more than a farmer can expect, after putting in his seed potatoes, to sit in his parlor and let them grow. They will not do their own ploughing and hoeing, and when ripe they will not jump into barrels and start for the market."

HISTORY OF A DIAMOND.

The largest diamond ever brought to this country has just been imported by a jewelry firm of Maiden Lane, New York. It is yet uncut, and has the yellowish hue common to all uncut diamonds. It may be reduced one-third by the cutting. It is impossible to estimate the value of the jewel until after it has been cut, when its color and full beauty will be revealed. It weighs 125 karats, and will probably be cut in Boston. Henry D. Morse, the great American diamond owner, says the big stone has a singular history. It was found in a diamond field in South Africa three or four years ago. The finder was one of a camp of diamond hunters in a dreary and remote district. When he accidentally stumbled on his great "find" he was overjoyed. Then a terrible fear took possession of him should his companion learn he had such a valuable stone in his possession. He endeavored to conceal his luck, but his actions betrayed him. He was murdered, and the man who murdered him met with a like fate. Before the stone reached this country it cost four lives. The last owner in dying gave it to a native, who sold it to a sea captain. In this way it reached America, and was purchased by its present owner.

A very important decision, which will affect jewelers, as well as all other merchants, was given at the Division Court sittings at Brighton, before Judge Benson, the peculiar case of Port *vs.* Pollock, creating much interest. About last November the defendant, a gallant young bachelor-farmer, living a few miles north, fell a victim to the charms of one of Warkworth's belles, and joined the noble army. In the exuberance of the honeymoon he called at plaintiffs jewelry establishment in Brighton, and chose a lady's gold watch and chain, valued at $90. He asked the plaintiff to put them by until his wife could call in and see them. The jeweler put them away, but saw no more of his

this Trade Mark is stamped on al Knives, Forks, Spoons and other flat ware of our manufacture.

The A 1 Goods are Standard Heavy Plate, and XII signifies that in addition the articles have an extra quantity o Silver on all the parts most exposed to wear.

The Meriden Britannia Company have been awarded the highest premiu ns wherever exhibited, from the WORLD'S FAIR, 1863, to the PRESENT TIME, and the high reputation of our Goods throughout the world has induced other makers to imitate our Trade Marks and name as well as our designs, and as many of our patrons have, through a similarity of names, purchased inferior goods under the impression that they were our manufacture, we are compelled to ask especial attention to our Trade Marks.

THE FACT THAT OUR NAME AND TRADE MARKS ARE BEING SO CLOSELY IMITATD SHOULD BE A SUFFICIENT GUARANTEE TO THE PUBLIC THA OUR WAR S ARE H BEST IN THE WORLD.

WE RE-PLATE OLD WORK AND MAKE IT EQUAL TO NEW.

customers till March last, when the young wife called and said she was to see the articles laid past by her husband for her. She thought they would do, and inquired if the jeweler would wait for his money till after harvest. This he consented to do, and thereupon his customer purchased jewelry to the further value of $20. When the flowers were in bloom and the honeymoon was over, the defendant called on the plaintiff and asked if his wife had got a watch and chain from him. Upon being answered in the affirmative he said, "Well, I don't feel like paying for them." It turned out that his partner did not apparently fully appreciate the romance of farm and dairy life, and had returned to town. The defendant learned that she had contracted other debts in the month of March amounting to hundreds of dollars. He then offered to pay all her debts if she would return home, but she declined. The action was brought by the plaintiff to compel defendant to settle the account for the watch, chain, and jewelry, amounting in all to $110. Mr L. U. C. Titus appeared for plaintiff and Mr. Kerr, Q. C., of Cobourg, for defendant. The plaintiff had a number of witnesses. Mr. Kerr asked for nonsuit on the ground that his wife had no authority to run her husband into debt without his written order. His honor took the same view and dismissed the case.

Our old friend, J. W. Jackson, jeweler, of St. Catharines, has sent us some of his Christmas advertisements, by which it would seem that he considers prose altogether too tame to portray the quality and beauty of his wares. Discanting on them he says:

Of all Watch Cases ever made,
The dust-proof "Boss" are far the best;
And this I say, in honest trade,
For twenty years they've stood the test.
I have a section that I show,
When seen you'll let all others rest,
And then your bottom dollar go,
That "Boss" Watch Cases are the best.
For all alike, both friends and foes,
Enough of bread and good warm clothes;
That undertakers may not thrive
No more than just to keep alive;
That poor men may find work to do
At wages that will keep them too;
That all will sign the people's roll
For Tilly to slack up on coal;
That each will do his best to make
Our land the one to take the cake;
That there may be some good in store
For each in Eighteen-Eighty-Four;
And when the year shall have an end
Man be to man a better friend;
That each may sport a new "Boss" Case
In Eighty-Four, the year of Grace.

What is termed by the London *Economist* "a blot on the parcels-post" is thus described by that journal. There is really a good deal of truth in the complaints we continue to hear, that the chief drawback to the use of the parcels-post for trade purposes is the impossibility of sending 1lb of goods for threepence, or 3 lbs. for the sixpence, and so on. To send 1 lb of tea or coffee involves as heavy a postage-charge as 2½ lbs., by reason of the necessary weight of the packages; and the suggestion that some such a scale as the following should be adopted is well worthy the attention of the Post-office authorities. It would greatly extend the business and utility of the Department:

Postage	Net Weight (Not Allowed).	Gross Weight (To Include Package).
3d	1 lb	1 lb 2 ozs.
6d	3 lbs	3 lbs 4 ozs.
9d	5 lbs	5 lbs 6 ozs.
1s	7 lbs	7 lbs 8 ozs.

Couldn't our Canadian postal authorities take a leaf from this? We think they could!

Says the *Monetary Times*:—An Industrial School, for the training of lads whose parents cannot or will not control them, and who are exposed to the evil surroundings which vagabondism or detention in goal implies, is the latest philanthropic proposal in our midst. The list of its governors shows it to be in good hands, and its appeal shows that need for such an institution exists. What was once quaintly said by an Illinois school superintendent, in speaking of the claims of a school system on society, applies here:—

"We must pay for refinement, intelligence and virtue, by training up our youth for good citizens. Each one of us must contribute to the support and honor of society—or to ignorance, immorality and crime. We must pay for the school-book—or the criminal code. Our young men will learn to drink knowledge—or to drink rum; to make laws—or to break them to hang upon the lips of ancient wisdom—or hang at the rope's end. We have our choice between gatherers of midnight lore and gatherers of midnight plunder. We must pay a little to mould our future citizens into good ones, or a great deal to control them when they become bad ones."

JEWELRY STOCK

FOR SALE.

Tenders will be received until noon on the 1st day of March at so much on the dollar of the invoice value for the stock in trade and fixtures of the late Robert Shaw, of Clifford, Ont.

The Stock List and Goods may be seen at the warehouse of McNaught & Lowe, 16 Wellington Street East, Toronto.

The highest or any tender not necessarily accepted.

Editorial.

A FEW PLAIN QUESTIONS.

We trust we shall not be deemed impertinent by our readers if we ask them a few pertinent questions about their business.

(1) Have you taken stock and found out exactly how your affairs stand; how much you are worth, and whether you are making or losing money? If not, the sooner you do so the better for yourself. Every merchant should balance his books once a year and find out exactly how he is prospering. Not only is it a satisfaction to know this, but the simple fact of his doing it puts a person in possession of a great deal of knowledge regarding his own business that he could otherwise hardly obtain. Thus for example, he finds out which goods are most saleable, and which stay on his hands, and which bear the largest margin of profit. He finds out too, who amongst his customers pay promptly, pay slowly, or do not pay at all. And right here let us say that the closer any merchant collects his accounts, without quarreling with his customers, the better for his trade and the more disposed they will be to continue trading with him. When a customer's account is square he comes in to see you with a quiet conscience and easy heart, and if he wants anything in your line he will probably buy it. If, on the contrary, he owes you money, he will keep clear of you for fear you will press him for his debt. Thus you not only remain out of your money, but lose the trade he ought to give you, but probably gives to some one else to whom he pays cash.

(2) Have you an adequate insurance on your store and stock? If not, find out how much insurance you should carry, and put your risk in some first class company, just as soon as you possibly can. This is a very important thing, and you cannot afford to procrastinate regarding it. Pick up any daily paper and you will find more than one record of losses by fire, and your turn may come when you not only least expect it, but are least prepared to stand it. If you are adequately insured you can rest easy, for if you had the misfortune to be burned out, you would know that your loss could be only nominal, and you would soon be in a position to start again.

These questions are very important to every merchant in Canada, whether he be rich or poor. They are not the outgrowth of idle fancy, but a necessity of any business that desires to be successful. If you can't answer them in the affirmative we would advise you to put yourself in a position to do so just as quickly as you possibly can.

NEWS.

There is an old saying that "if you want to learn the news you must go away from home." While not strictly true this is certainly the case in many instances, as the following, which we clip from an intelligent jewelers' journal published across the border, will show. The item reads as follows:

"The trade of New York importers with Canadian buyers is likely to receive a serious blow from the latest revision of the Canadian customs laws. The Parliament of Canada at its last session enacted that *ad valorem* duties shall be imposed upon the value of goods when sold for consumption in the country whence they were exported direct to Canada. This is nothing but an indirect and most reprehensible method of handicapping United States merchants in their competition with those of Europe for the Canadian trade. It adds to the confusion previously existing in our commercial relations with the Dominion the spice of malice prepense."

It is a strange fact, but nevertheless a true one, that our wideawake neighbors to the south of us always get beyond their depth whenever they attempt to touch on things outside of their own immediate sphere. Anyone who knows anything about Canadian Customs' laws knows full well that this country does not discriminate against any country. The Dominion of Canada has but one customs' law, and no matter whether an import comes from our sterling old father, John Bull, or our sharp brother Jonathan, the same rate of duty is levied upon it in either case. If the duty be *specific*, it is so levied all round; if an *ad valorem* one the same rule is followed. It is true that our customs' authorities will not allow European goods to be billed from New York on the bill heads of American firms, and that they justly demand that they be passed on the original invoices and through bills of lading. While all this is true the same rule is enforced in regard to English commission houses, who have no advantage in any respect over their New York competitors. The customs law to-day in this particular is the same as it has been for years, and the only difference is that, owing to the many frauds perpetrated by sharp Canadian importers who, with the help of unscrupulous New York commission men, systematically defrauded the revenue by means of false invoices, the government has been obliged to put the law more strictly in force. Of course to such a class of men the restriction is irksome, and they squeal because they cannot so easily as formerly cheat the Canadian government by collusion with importers on this side. To the honest commission merchant however, whether in New York or London, and we are glad to know there are many such, the enforcement of our customs law can make no appreciable difference. In fact we rather think they will hail it as a boon for it will serve to put them on more of an equality with their less scrupulous rivals, by forcing the latter to comply with the demands of the law instead of as formerly evading it. The statement that the passage or enforcement of such an act would handicap the New York merchant is the veriest bosh, unless their trade depends upon some evasion of the law to make it profitable. The fact is that this "foreign import" trade of which our contemporary speaks, does not amount to very much in any case. It may have been so years ago, but Canadian merchants are now strong and enterprising enough to import direct

from almost every country under the sun, and to pay as promptly and buy as close as their New York rivals can. This, we think, is the real cause why this foreign import trade has fallen off so much of late.

In reference to the confusion of commercial relations between Canada and the States, we would ask our contemporary to remember that anything of this kind arises entirely from their own selfishness. The history of the commercial relations between these two countries is one long record of a large country trying to come a grab game over a small one. Canadians, however, are an independent people, and the abrogation of the reciprocity treaty and other things of a similar character, and instead of bringing them to their knees and hastening annexation, as was intended, has had the opposite effect of making them more self-reliant, and crushing out whatever leaning there may formerly have been in that direction. Canada is now strong enough to stand upon her rights, and the honest exporters of the United States may rest easy in knowing that their trade with this country will not be interfered with in any way for the benefit of exporters in other foreign countries.

And as we are speaking of customs regulations we may here observe that as compared with those of the United States, the laws of Canada are simplicity itself. Customs entries here take only a few minutes to make, and if goods and invoices are "straight," the former are usually delivered in the merchant's warehouse within twenty-four hours. Of the U. S. regulations we need not speak at length, for time would fail us to tell of the delays and extortions that have to be borne before the goods are finally delivered to the importer; we have had experience of it, and we say without hesitation that we would rather make ten entries in Canada than one in the United States. The Canadian, customs laws are very simple and if American exporters would only remember to comply with them they would save themselves and their customers here a great deal of trouble. Many American importers seem to imagine that Canada, instead of being a foreign country is a part of the United States. They write you about some business and enclose an addressed envelope prepaid with an American stamp, forgetting that such a thing is of no value here. When shipping goods by express, many of them forget that invoices should be sent in duplicate by mail and simply enclose one bill inside the package, and unless the consignee gets a permit to examine the package he may remain in ignorance of whose goods they are until the consignor draws on him for the money. Then an explanation is sure to ensue. Again, customs regulations demand that all foreign invoices must have written across the bottom of each, the words "certified correct," and the signature of the consignors. This in most cases they fail to do, and the result is delay and consequent loss of trade. The sooner that our American cousins learn that Canada is an independent foreign country and its laws have got to be complied with, the better for both the volume and ease with which their trade with it will be done. When this lesson is once thoroughly learned we will have less of such charges as "malice prepense," and a kindlier era will dawn upon the commercial relations of these two English speaking countries.

AN IMPORTANT QUESTION.

The question before Parliament at the present moment of a loan to the Canadian Pacific Railway Company of $22,500,000.00 for the purpose of finishing the construction of their line, is one that will have a very strong bearing on the future of this country for a century to come. This is a very important question and should not be considered altogether from a dollar and cent point of view. We think it an imperative necessity that the eastern section of the road from Port Arthur to Callender should be pushed through with the least possible delay, and we should favor a liberal grant of money to help it through, provided that proper and sufficient security for its repayment were given by the company. We do not see, however, that the people of Canada should be forced to tax themselves for the purpose of enabling a lot of millionaires, who are already living in palaces and on the fat of the land, not only to become more wealthy, but to do so by buying up all the competing railroads they can secure, and thus enable themselves more easily and surely to bleed the public by whose mistaken generosity they have been enabled to attain the position of masters instead of servants of the public. Ever since the inception of their great monopoly have the C. P. R. Company been buying up rival charters and rival roads, and if their money had held out we should ere this have felt more keenly the grasp of their iron hand. As it is the people of the North-West have been well nigh goaded into open rebellion, and serious injury has been done to the trade between Manitoba and the older provinces. The present is a good time for the country to get a repeal of those obnoxious monopoly clauses in the original charter, and the Parliament of Canada will be derelict in its duty if it does not insist on their being cancelled before any further money is advanced. It seems to us that the sum asked for is excessively large and the security absurdly small. The more money the people furnish in this way the greater the risk of the road being thrown on their hands as soon as completed and the company have squeezed all the money they can out of the country.

The Grand Trunk Railway, by their unwise and threatening manifesto to the government, have not only added a new and bitter factor to the controversy, but furnished a very strong weapon to the Canada Pacific Company which will help them to get the proposed arrangement carried out in its entirety. The fact is that both the Grand Trunk and Canada Pacific Companies are soulless corporations, and each is trying to get the better of the other and fill its own coffers at the public expense. Their charges and counter charges against each other may serve to attract the public attention from the real question at issue until it is too late, but those who look beneath the surface can easily see that the motive underlying each is a purely selfish one. These companies to-day are deadly enemies, so far as the public can see it is war to the knife. To-morrow they may be the best of friends and form a coalition which would mean little short of ruin to the trade of this country. No companies could have been more antagonistic than the Grand Trunk and Great Western, but when it came to a question of profit and the English owners found they could extract more money out of the people of Ontario by being friends instead of enemies, they put their feelings into their pockets and to-day are as friendly to each other as they are antagonistic to the best interests of the Province which affords them a living. The same thing, only on a larger scale, might occur between the Grand Trunk and the Canada Pacific, and if it did come about it would simply mean

that the Dominion of Canada would be at the mercy of a corporation of soulless capitalists who would raise the price of freight and passenger transportation as high as they could possibly go without creating a rebellion. We have no doubt that the government party will give the C. P. R. company everything they ask, whether it be twenty or fifty millions of dollars, but if they do thus sacrifice our money they should at least do so on the distinct understanding that no purchase, amalgamation or working arrangement shall ever be possible between it and the Grand Trunk Company. While we think the government should not deny the C. P. R. company some measure of relief at this juncture, we think that it should be restricted to such an amount as would serve to complete the eastern section of the road without any delay. It seems to us that the British Columbia section can wait for a few years, and be completed as soon as the eastern section is in running order.

Looking at the question purely from a commercial standpoint we cannot refrain from expressing the opinion that the present bargain will be worse for the country than the original one. It means a large increase to our national debt with little or no security for its repayment; it means that the C. P. R. company run the country and not the government; it means that if the present amount is not sufficient for their purpose that they have only to demand more in order to get it. It means that a few millionaires are to be made doubly wealthy at the expense of the masses, as the present proposal is little short of direct confiscation. In conclusion we certainly think that if any merchant would manage his own private business in the same reckless manner in which the government has managed the Canada Pacific Railway business, his friends would within twenty-four hours have him examined by a medical commission to find out whether he was *compos mentis* or not.

Selected Matter.

CLEANING WATCHES FOR FIFTY CENTS.

Few things in connection with the repair of watches could be more absurd than the proposition to clean watches for fifty cents. Yet there is nothing that will make jewelers quake in their boots so readily as the mere mention of such a thing. The job, as any jeweler worthy of the name knows, is worth more money, and no one who desires "to be known by his works" will ever attempt to clean a watch for fifty cents.

An instance came under our notice recently where a nomadic jeweler, having found some one who was willing to trust him for one month's rent of a shop, opened up in opposition to the regular jewelers, and at once heralded his intention of cleaning watches for the ridiculous figure above indicated. Of course he was at once patronized by that class whom it generally takes a jeweler about two years to get rid of.

First, there was the man with an old Swiss watch that was past all repairs, yet the owner expressed his unalterable belief in the time-keeping qualities of his watch and his firm conviction that the entire trouble was caused by the jeweler stealing the jewels from it. Then there was the man who was in debt to the established jeweler for about five dollars' worth of repairs on a three-dollar watch. Of course the man whom the jeweler had refused credit was on hand with his old turnip. It is not long before the "smart Alex.," who knows just what is the matter with his watch and sets his own price on the job, shows up. The fellow who is always looking for a cheap thing sees an angel in the fifty-cent tramp, and takes several of his neighbors' watches along to be "fixed." Then there is the drunken loafer whom the jeweler was compelled to bounce out of the store, and, lastly, all the cranks and fools that jewelers are sure to offend in course of business.

When these worthies assemble in the tramp's shop, they proceed to tear out the legitimate jewelers in first-class style, and express their conviction that there is not one of the old jewelers that knows the first principles of watch-making, and wonder that the indignant public has not risen up in its wrath and expelled them from their midst. They hail with great joy this man who is to deliver them from the avaricious clutches of the old watchmakers, and prophesy great things for him. This of course swells the head of the tramp and leads him to the belief that he is going to have a roast in scooping the regular trade. The watches of all these people show up largely on the tramp's board, which so frightens the jeweler that, without stopping to consider, they at once reduce their own price to that of the tramp's, thus putting themselves on a level with the cheap man. The imprudence, not to say cowardice, of this step is evinced by the implied admission that they had been previously overcharging their patrons.

The result of the venture was, the cheap man, failing to get much money from this crowd, "folds his tent like the Arab, and silently steals away," not forgetting to carry off his customers' watches.

We have observed the fifty-cent system of watch-cleaning very closely, and saw that where the regular jewelers paid no attention to the claims or performances of these cheap craftsmen the latter soon petered out, generally leaving town between the setting and rising sun. A bona-fide jeweler can safely dispense with the patronage of the class we have enumerated, and treat with the contempt it deserves the proposition to clean a watch for less money than the job, when properly done, is really worth. To acquiesce in the price of the fifty-cent man is to confess previous extortion, besides making progress like the crab—backwards.—*The Keystone.*

BUSINESS LAW IN DAILY USE.

The following compilation of business law contains the essence of a large amount of legal verbiage and will be found useful to our readers.

If a note is lost or stolen, it does not release the maker; he must pay it, if the consideration for which it was given and the amount can be proven.

Notes bear interest only when so stated.

A note made on Sunday is void.

A note by a minor is void.

A note obtained by fraud, or from a person in a state of intoxication, cannot be collected.

"Value received" is usually written in a note, and should be, but is not necessary. If not written, it is presumed by the law, or may be supplied by proof.

The maker of an "Accommodation" bill or note (one for which he has received no consideration, having lent his name or credit for the accommodation of the holder) is not bound to the person accommodated, but is bound to all other parties, precisely as if there was a good consideration.

A note endorsed in blank (the name of the endorser only written) is transferable by delivery, the same as if made payable to bearer.

If the time of payment of a note is not inserted, it is held payable on demand.

The time of payment of a note must not depend upon a contingency. The promise must be absolute.

A bill may be written upon any paper, or substitute for it, either with ink or pencil.

The payee should be distinctly named in the note, unless it is payable to bearer.

An indorsee has a right of action against all whose names were on the bill when he received it.

If the letter containing a protest of non-payment be put into the post-office, any miscarriage does not affect the party giving notice.

Notice of protest may be sent either to the place of business or of residence of the party notified.

The holder of a note may give notice either to all the previous indorsers or only to one of them ; in case of the latter he must select the last indorser, and the last must give notice to the last before him, and so on. Each endorser must send notice the same day or the day following. Neither Sunday or legal holiday is to be counted in reckoning the time in which notice is to be given.

The loss of a bill or note is not sufficient excuse for not giving notice of protest.

If two or more persons as partners are jointly liable on a note or bill, due notice to one of them is sufficient.

If a note or bill is transferred as security, or even as payment of a pre-existing debt, the debt revives if the bill or note be dishonored.

An indorsement may be written on the face or back.

An indorser may prevent his own liability to be sued by writing " without recourse," or similar words.

The finder of negotiable paper, as of all other property, must make reasonable efforts to find the owner before he is entitled to appropriate it for his own purposes. If the finder conceal it, he is liable to the charge of larceny or theft.

Joint payees of a bill or note, who are not partners, must all join in an indorsement.

One may make a note payable to his own order. He must then write his name upon its back or across its face, the same as any other indorser.

After the death of the holder of a bill or note, his executor or administrator may transfer it by his indorsement.

The husband who acquires a right to a bill or note which was given to the wife either before or after marriage, may indorse it.

An agreement without consideration is void.

Contracts made on Sunday cannot be enforced.

A contract made with a minor is void.

A contract made with a lunatic is void.

Each individual in a partnership is responsible for the whole amount of the debts of the firm, except in cases of SPECIAL PARTNERSHIP.

The acts of one partner bind all the rest.

A verbal promise to pay, made without conditions, is generally held as sufficient to revive a claim otherwise shut out by the law of limitation.

An oral agreement must be proved by evidence. A written agreement proves itself. The law prefers written to oral evidence, because of its precision.

No evidence may be introduced to CONTRADICT OR VARY a written contract, but it may be received in order to explain it, when such contract is in need of explanation.

Checks or drafts must be presented for payment without unreasonable delay.

Checks or drafts should be presented during business hours ; but in this country, except in the case of banks, the time extends through the day and evening.

If the drawee of a check or draft has changed his residence, the holder must use due or reasonable diligence to find him.

If one who holds a check, as payee or otherwise, transfers it to another, he has a right to insist that the check be presented that day, or, at farthest, on the day following.

If a debtor owes several debts, and pay a sum of money to the creditor, he has the right to designate the particular debt to which the payment shall apply, and the creditor must so appropriate it.

If, when a debt is due, the debtor is out of the country, the "six years" do not begin to run until he returns. If he afterward leave the country, the time forward counts the same as if he remained in the country.

Except in case of absence from the country, the "six years" begin when the bill or account is DUE. In case of a note, they count from the "three days of grace." In case of a note on demand, they count from the time of the demand.

The Statute of Limitations does not avoid or cancel the debt, but only provides that no action in law may be maintained after a given time. The statute does not affect collateral security.

Ignorance of the law excuses no one.

The law compels no one to do impossibilities.

It is a fraud to conceal a fraud.

Signatures made with a lead pencil are good in law.

A receipt for money is not always conclusive.

No consideration is sufficient in law if it be ILLEGAL in its nature.

All claims which do not rest upon a SEAL OR JUDGMENT must be sued within six years from the time when they arise.

Part payment of a debt which has passed the time of statutory limitation revives the whole debt, and the claim holds good for another period of six years from the date of such partial payment.

Written instruments are to be construed and interpreted by the law according to the simple, customary, and natural meaning of the words used.

"Acceptance" applies to bills, and not to notes. It is an engagement on the part of the person on whom the bill is drawn to pay it according to its tenor. The usual way is to draw across the face of the bill the word "Accepted," and sign the name immediately below it.

THE PERILS OF HOME.

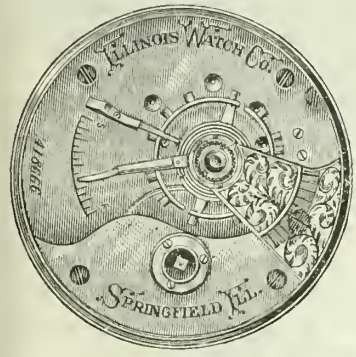
MARK TWAIN ON THE DANGERS OF TRAVELLING.

The man in the ticket office said :—

"Have an accident insurance ticket also ?"

"No," I said, after studying the matter over a little. "No, I believe not; I am going to be travelling by rail all day to-day. However, to-morrow I don't travel. Give me one for to-morrow."

The man looked puzzled. He said :



"But it is for accident insurance, and if you are going to travel by rail—"

"If I am going to travel by rail I

sha'n't need it. Lying at home in bed is the thing I am afraid of."

I have been been looking into this matter. Last year I travelled 20,000 miles, almost entirely by rail; the year before I travelled over 25,000 miles, half by sea and half by rail; and the year before that I travelled in the neighbourhood of 10,000 miles, exclusively by rail. I suppose if I put in all the little odd journeys here and there, I may say I have travelled 60,000 miles during the three years I have mentioned. And never an accident.

For a good while I said to myself every morning; now I have escaped thus far, and so the chances are just that much increased that I shall catch it this time. I will be shrewd, and buy an accident ticket." And to a dead moral certainty

I DREW A BLANK

and went to bed that night without a joint started or a bone splintered. I got tired of that sort of daily bother, and fell to buying accident tickets that were good for a month. I said to myself, "A man can't buy thirty blanks in one bundle." But I was mistaken. There was never a prize in the lot. I could read of railway accidents every day—the newspaper atmosphere was foggy with them, but somehow they never came my way. I found I had spent a good deal of money in the accident business, and had nothing to show for it. My suspicions were aroused, and I began to hunt for somebody that had won in this lottery. I found plenty of people who had invested, but not an individual who had ever had an accident or made a cent. I stopped buying accident tickets and went to ciphering. The result was astounding. The peril lay not in travelling, but in staying at home.

I HUNTED UP STATISTICS

and was amazed to find that after all the glaring newspaper headings concerning railroad disasters less than 300 people had really lost their lives by those disasters in the preceding twelve months. The Erie road was set down as the most murderous in the list. It had killed forty-six—or twenty-six, I do not exactly remember which; but I know the number was double that of any other road. But the fact straightway suggested itself that the Erie was an immensely long road, and did more business than any other line in the country; so the double number of killed ceased to be matter for surprise.

By further figuring, it appeared that between New York and Rochester the Erie ran eight passenger trains each way every day—sixteen altogether—and carried a daily average of 6,000 persons. This is about a million in six months, the population of New York city. Well, the Erie kills from thirteen to twenty-three persons out of its 1,000,000 in six months; and in the same time 13,000 out of New York's 1,000,000 die in their beds! My flesh crept; my hair stood on end. "This is appalling," I said, "The danger isn't in travelling by rail, but in trusting to those deadly beds. I will never sleep in a bed again."

I had figured on considerably less than one-half the length of the Erie road. It was plain that the entire road must transport at least 11,000 to 12,000 people every day. There are many short roads running out of Boston that do fully half as much; a great many such roads. There are many roads scattered about the Union that do

A PRODIGIOUS PASSENGER BUSINESS,

therefore it was fair to presume that an average of 2,500 passengers a day for each road in the country would be about correct. There are 846 railways in our country, and 846 times times 2,500 are 2,115,000. So the railways of America move more than 2,000,000 people every day—650,000,000 of people a year, without counting the Sundays. They do that, too—there is no question about it—though where they get the raw material is clear beyond the jurisdiction of my arithmetic; for I have hunted the census through and through, and I find that there are not that many people in the United States by a matter of 610,000,000 at the very least. They must use some of the same people over again, likely.

San Francisco is one-eighth as populous as New York; there are 60 deaths a week in the former and 500 a week in the latter—if they have luck. There are 3,120 deaths a year in San Francisco, and eight times as many in New York—say 25,000 or 26,000. The health of the two places is the same. So we will let it stand as a fair presumption that this will hold good all over the country, and that consequently 25,000 out of every million of people we have must die every year. That amounts to one-fortieth of our total population.

ONE MILLION OF US THEN, DIE ANNUALLY.

Out of this million ten or twelve thousand are stabbed, shot, drowned, hanged, poisoned or meet similarly violent death in some other popular way, such as perishing by kerosene, lamp and hoop-skirt conflagration, getting buried in coal mines, falling off housetops, breaking through church and lecture-room floors, taking patent medicines, or committing suicide in other forms. The Erie railway kills from twenty-three to forty-six; the other 845 railroads kill an average of one-third of a man each; and the rest of that 1,000,000, amounting in the aggregate to the appalling figure of 987,631 corpses, die naturally in their beds!

You will excuse me from taking any chances on those beds. The railroads are good enough for me.

And my advice to all people is, don't stay home any more than you can help; but when you have got to stay home a while buy a package of those insurance tickets and sit up nights. You cannot be too cautious.

[One can see now why I answered that ticket agent in the manner recorded at the top of this sketch.]

The moral of this composition is, that thoughtless people grumble more than is fair about railroad management. When we consider that every day and night of the year full 14,000 railway trains of various kinds, freighted with life and armed with death, go thundering over the land, the marvel is, not that they kill 300 human beings in a twelvemonth, but that they do not kill 300 times 300.

SPONTANEOUS COMBUSTION.

With all the facts to show the possibility of the spontaneous ignition of certain substances under certain circumstances, there is a constant demand for more information. So it is well enough to cite instances of fires caused by spontaneous combustion, even though it may be that "line upon line, precept upon precept" should be the rule.

A pile of cloth—cotton—left in a heap just as it came from the loom, and probably more or less saturated with oil, blazed up and fired a building in which there never was a fire or light before. This fire was probably caused by the piling of cotton cloth in heaps, the fibres of the cotton being saturated with oil—in this instance sperm oil, the only lubricating oil then in use.

WHOLESALE HOUSES.

and woollen waste took fire on a summer afternoon, and resulted in the destruction of several buildings. In this case the waste filled with oil, was packed closely in bins, or compressed into bags for convenience of stowing. Evidently compression, or weight, was an element in this case of spontaneous combustion.

A large establishment for the manufacture of machinery was burned by being fired from a heap of iron turnings thrown out from a convenient window, the greasy cotton cleaning waste being intermixed. It is hardly necessary, however, to have the element of greasy cotton waste in order to produce, or communicate, fire from a heap of iron turnings, chippings, and filings. The mass of disintegrated iron and its contained oil are enough to incite heat and combustion. And careful observers can see, in the dark, the blue luminous shivers of flames over a heap of iron drilling, chips, shavings and filings, adjacent to machine shops.

One of the finest blocks of buildings in an eastern city was destroyed, just before being ready for occupancy, by a fire started in an unused closet in which painters had thrown their overalls, these garments being presumably loaded with linseed oil and turpentine.

To these instances may be added some which were recently cited in *Chambers's Journal*. One of them dates back to 1780, when a Russian naval vessel took fire, and no cause except that of spontaneous combustion could be found or surmised. The fire was traced to a package of matting containing lampblack made from the smoke of fir and hemp oil varnish. A carefully observed experiment demonstrated the fact that a closely bound package of this mixture of lampblack and oil took fire within seventeen hours.

Wool-combings, packed in a warehouse in bins and trodden down hard by the workmen, set fire to the building. The wool was saturated with oil, or was at least oily, and the compression was probably one of the elements to spontaneous ignition

Oily hemp and flax in bales and heaps, took fire spontaneously in Plymouth dockyard and caused great destruction of property. In 1861 or 1862 there was a great fire in the Liverpool dock warehouses, caused, as far as could be ascertained, by the spontaneous ignition of wet cotton in bales.

The naval ships *Imogene* and *Talavera* were burned in Davenport dockyard by the spontaneous combustion of oakum and tow, that had been used as waste for wiping greasy tools and machinery, and thrown into a bin.

Experiments prove that cotton waste wet in boiled linseed oil, placed under a temperature of 170° F., took fire in one hour and a quarter. Raw linseed oil on cotton required four or five hours under similar preliminaries; olive oil, six hours; rape oil, ten hours; and castor oil, two days. As to animal oils, lard oil with the cotton produced ignition in four hours; seal oil in one hour and twenty minutes; and sperm oil—probably adulterated with petroleum—did not fire in two days. Is is generally conceded that the mineral oils, of whatever specific gravity or constituent characteristics, are not liable to aid in spontaneous combustion.

But there are other causes of spontaneous combustion not usually considered, and yet established as facts by experiments and observation. Grain, either in the kernel or the straw, if packed into the bins or piled into stacks while damp or only partially cured, will sometimes generate heat enough to cause combustion. Some of the supposed incendiary fires, by which barns have been burned, have been traced to this cause of spontaneous ignition, and in some other instances only that supposition was left as a reason for the fire. One case can be quoted as characteristic. It is taken from the *Annales d'-Hygiene:* A quantity of oats stored in a barn had been consumed by fire, and the proprietor suspected the act to be one of incendiarism. Several experts were consulted; and on enquiring into all the circumstances, they unanimously concluded that the fire was the result of spontaneous combustion caused by the fermentation of the grain stored in a damp state. Several things pointed unmistakably to this conclusion, such as the fact that the oats were proved to have been stored damp; that labourers had noticed the heat of the oats several days previous to the fire; that some of the sheaves that had been moved the day previous to the fire to be thrashed were charred and discolored; and above all, that the centre of a large pile of sheaves retained their natural color.—*Scientific American.*

THE TREATMENT OF THE MAINSPRING.

The observant horologist will concur with me in saying that there is no one part of a watch not requiring as much care and attention as another. Yet watchmakers may be found by the dozen who regard certain parts of the movement as something inferior, something secondary in importance; and in first line, the mainspring may be classed in that category; they maltreat it until one thinks he has to do with a layman who plays with it for the sake of entertainment. The mainspring, at all odds, demands the same care in its arrangement and treatment as the balance spring, if it is intended to fully and completely discharge its functions, and these are at least tantamount to those of the balance spring. By an execution, no matter how careful, the watch will only render indifferent services, if its motor power, the mainspring, has been neglected. I do not claim these preceding remarks as new or my property, but facts compelled me to reiterate them before proceeding with the statement of my few observations and researches in the premises. The breaking of the spring also is the consequence of such bad treatment.

The causes which favor the breaking of the spring have been treated heretofore in this journal, (*Allg. Journ.*), and it is unnecessary to reproduce them. I suppose them to be universally known. Many will have experienced that soon after having cleaned a watch, the spring will suddenly snap, although having done services for ten years or more; else, a new spring is inserted, and a few hours afterward, or at the first winding, even, it breaks. Such accidents are often calculated to bring discredit upon the watchmaker, because according to the views of the layman, it is incomprehensible that a spring, after ten years' service, should break after cleaning, or that a new spring should snap.

In both cases the repairer is blamed for the accidents. In the first case, we must suppose that the barrel was correct in its shape, having harbored the spring for ten years; in the second, that possible defects causing the breaking of the first spring, were remedied. Under these suppositions, the cause may be looked for in the careless treatment the spring received. I have often had occasion to witness how the spring, for purposes of

SOMETHING NEW IN GOLD CASES

We would call the attention of the Trade to our

10 Karat Gold Cases.

These goods are manufactured by the American Watch Co. of Waltham, Mass., and are made in every Style and Size to fit the Waltham Movements. The outside, or wearing surface, is 14 karat gold. The inside, or not exposed surface, is 8 karat gold, and when taken together the case will assay 10 karat. Thus possessing every quality of a much higher grade of case, and for Style, Finish and Durability are FAR SUPERIOR TO ANY OTHER THAT IS OFFERED TO THE TRADE AT THE SAME PRICE.

FOR SALE BY ALL LEADING JOBBERS IN CANADA.

cleaning, was seized with a rag, and then drawn out pitilessly and unmercifully. No other consequence can follow such a treatment than the breaking at the earliest possible occasion. Cleaning is best done in the following manner : Lay the spring into benzine. As soon as the adhering oil has become dissolved, it is taken out and seized with a soft linen rag, which imbibes the greatest part of the adhering benzine. Next cover the palm of the left hand with a dry corner of the rag, put the spring flat upon it, and with the index finger of the right hand, around which another part of the rag is wound, press gently upon it, and let it assume a conical shape ; by suitable motions of the finger while wiping, the spring will turn, and every part of its blade may easily and thoroughly be cleansed of all impurities. A spring treated in this manner will be freed of all matter, while at the same time its molecular arrangement is not violently interfered with, calculated to injure its elasticity. Another method for cleaning a spring consists in taking a winding key with wooden handle, wrap one or two turns of clean rag around it, and gently follow the different coils, while for the inner ones, use a brush.

After cleaning, we come to the winding in of the spring—a manipulation either not whatever, else only partly understood and observed, yet it is an operation of high importance ; if I had space and inclination, I could recount highly entertaining stories on this subject.

The winding in is either performed with the winder or hand, hooking the spring in the barrel with its outer end, and bending it in little by little ; else by putting together the barrel, hooking the spring with its inner end, and turning the arbor, whereby the spring coils around it. The latter two methods cannot be recommended ; the sideward flexion of the spring is so strong that its elasticity must suffer thereby.

The spring winder, consequently, is the sole remaining means. Reasonable caution, also, is necessary with it. The main requisite of a good winder is that its arbor, together with shoulder, run truly round and have no shake. The shoulder must correspond exactly to the size of the spring core, around which the spring is to be wound, and all other parts being suitably proportioned, and due care is observed, there is no obstacle in the way of locating the spring flat and firm upon the barrel bottom, without exposing it to injurious side flexion.—R. T., in *Allg. Journ. d. Uhrm.*

BUSINESS EVILS.

We are favored with an interesting letter from a firm of fancy goods dealers in Quebec, which deals very frankly with some of the evils that surround the business of an importer or wholesale dealer in Canada to-day. "You ask how we have found business," their letter runs : "Business has been fairly good with us ; but credits are too long ; the dating of goods ahead is an ulcer on the business system ; clerks and travelling salesmen are paid too much in proportion to the profits which they secure, as a rule, to those who employ them. They think too much of themselves, do these salesmen, and they are the makers of most of our bad debts. Let us have some articles in your paper on these matters, especially on the evils of too long credit."

There is "much in little" here. The above plain statements will be corroborated by wholesale dealers generally. Business *is* being done at too great expense, for too little profit and at entirely too long terms. Periodically, a particular trade becomes aroused to the need of change in some of these respects, holds a meeting or comes to an agreement to shorten credit or to cease dating ahead. Not long ago, for example, the leather and findings houses in Montreal agreed to limit credit to four months. We trust they will stick to the agreement. But it requires some firmness for houses to remain true to a compact such as this, when their weaker competitors sit up at nights or stay in-doors on Sundays, scheming how they can evade the spirit of their agreement without breaking the letter of it.

This, however, may be said with all truth, for their encouragement : Sensible and solvent retailers in Canada (who are becoming year by year, we believe, more numerous) perceive the dangers of long credit and the advantage of short terms. Many of these will, in spite of temptations to the contrary, remain constant to houses which, buying goods well and selling them honestly, yet persist in short terms of credit. Both retail and wholesale dealers benefit by them ; over-lapping of purchases is avoided ; too heavy stocks are escaped ; while the corrosion of interest and the heavy item of depreciation in value of merchandize are reduced to a minimum. Importing houses which adhere to short credit and command the custom of good retailers, have the satisfaction of making fewer bad debts, even if their profits are less ; and can outlive their most reckless competitors. The retail dealer, on his part, if he be content to stick to a house which does business on proper business principles, will soon realize that by adopting the policy of buying "little and often," and giving short notes or taking cash discount, he will live an easier and more prosperous business life than by over loading himself with the heavy lines of job lots which a "pushing young house" may get him to buy through extra time, renewals for half, "special discounts off list price," or the various inducements held out through facile travellers or more dignified but not less anxious principals.

Our importers, many of them, do not look far enough ahead. They are too apt, in aiming to secure a present advantage, to lose sight of the future effect of a policy of relaxing salutary rules. Forced sales mean, nine times in ten, difficult payments. A customer secured by a "cut," and retained by means of extra terms, is oftentimes a costly customer rather than a paying one. An evil of the times, and not a small one, is the tendency to give away the profits on merchandise in concessions of one kind and another to attract custom. No merchant, worthy of the name, will persist in selling goods without a profit. He wastes his time, his capital and his credit by so doing.—*Monetary Times.*

in each Pattern in Geneva, St. James, Countess, Windsor, Oval Thread, etc. Made under the supervision, and quality guaranteed and controlled by Wm. Rogers, formerly of Hartford and Meriden. (Wm. Rogers, Sr., died 1873.)

WM. ROGERS,

Wallingford, Conn.

No connection with any concern in Waterbury, Meriden or Hartford using name of Rogers in any form

FACTORIES: WALLINGFORD, CONN., U.S., AND MONTREAL, CANADA.

Walsh & Lefort, of Montreal, jobbers in jewelry and fancy goods, have assigned. Their liabilities are moderate in amount, and are principally due in Paris, and to their bankers.

Mr. D. Fenwick, watchmaker, for the past seven years an employee of Messrs. Fowler & Co., St. Catharines, Ont., opens out a watch-making and jewelry establishment at Niagara Falls, Ont., on 1st of this month.

Mr. Fred. Chinneck, the well-known Jeweler, of Napanee, has recently enlarged and refitted his establishment, and can now boast of having one of the handsomest and best appointed shops east of Toronto. "The Trader" wishes him continued prosperity.

Messrs. Park & Smith, Jewelers, of Wingham, have recently dissolved, J. R. Smith retiring. The business will in future be continued by Mr. H. Park, the practical partner of the late firm, under whose management we think it will not be allowed to deteriorate any. We wish him success.

The Illinois Watch Co. are making great improvements in their line of watches, and promise very soon to be a formidable rival to their older competitors. Their movements are well finished and their time-keeping qualities have been such as to make them favourites wherever they have been tried.

By a sad accident, Mr. J. P. Beall, of the Montreal house of Beall, Ross & Co., met his death on Monday last. Jumping from a train in motion at Whitby, he rebounded from the snow-drift and was struck by a projection of the car, sustaining injuries to the spine from which he died in a few hours.

John W. Fraser, Jeweler, of Milton, Ont., has made an assignment to David Watson Campbell, of the same town, for the benefit of his creditors, and is at the same time, we understand, trying to make a compromise. Fraser appears to have confessed judgment for a considerable amount to one of his principal creditors, which action, although it may give him the winning hand in the present deal, will permanently injure his credit. This is another illustration of the beauty of the present chaotic system of being without an Insolvent Act.

"The Trader" last week received a gilt edged invitation to attend the wedding of Mr. Moses Cochenthaler, Jeweler, of Montreal, to Miss Hattie Workman, of the same city. Stamps being scarce we were compelled to decline the invitation with thanks, but we sincerely wish Moses all the happiness incident to the occasion, just the same as if we had been able to put in an appearance.

A Lucky Escape.—Mr. E. Culverhouse's jewelry store was entered by burglars a few weeks ago. The safe door was blown out about two inches, not sufficiently, however, to allow the burglars to get any of the valuables out of the safe. We trust Mr. Culverhouse may always be as fortunate, for although the loss of a safe is bad enough, it is light compared to what would have happened had the burglars succeeded in getting it open,

The Dominion revenue for January shows a falling off of about half a million dollars from that of the corresponding month last year. The principal cause is the decrease in imports, and consequently in Customs receipts, which only amounted to $1,235,000, as against $1,611,000 in January, 1883. This is a good sign for the future, as the evil of over-importation is the principal cause of the present financial stringency.

What's in a Name.—J. D. Rutherford, jeweler, Colborne. Ont., had a set of jewelry stolen from him worth $38. It is said that a lady highly connected in the village, and a prominent member of the church, had been examining his stock, but suspicion did not attach to her. Others were suspected, but a chain of circumstantial evidence led to the certain conclusion that the lady in question was the guilty party. Mr. Rutherford refused to prosecute, preferring to believe it a case of kleptomania.

The Waltham Watch Co. have recently reduced the price of the watch movements of their manufacture, and the indications are that all the other companies will be compelled to follow suit in the near future. Of late years the watch manufacturers have been masters of the situation as the demand has been in excess of the supply Now, however, that dull times have come on, the demand has decreased so much that the supply is now in excess of the requirements of the country. As we pointed out last summer in an editorial article, this trade like all others, obeying the laws of supply and demand, was bound to reduce as soon as dullness in trade set in. We do not look upon this reduction as any aid to business however, for as a rule the country is most prosperous when goods are high and people have plenty of money to pay for them.

The Kleiser Case again.—After passing through the devious ways of litigation from the Police Court to the Common Pleas division, the Kleiser-Matheson case was decided at Osgoode Hall last month. Matheson, it will be remembered, was a devotee at the shrine of faro, and in an all night session he succeeded in getting ahead of his opponent, Mr. S. P. Kleiser, to the extent of $87. When cited before P. M. Denison, Matheson was mulcted in the sum of £50 for gratifying his sporting proclivities. The conviction was based on a statute passed when George III. was king. Mr. Bigelow, the defendant's counsel, held that this relic of antique legislation was *ultra vires*. The Court held differently, and Col. Denison did not concur in Mr. Bigelow's opinion that the Police Magistrate had no jurisdiction. The case was appealed and the other day Chief Justice Wilson and Justice Galt delivered judgment. Their Lordships held that while the statute was perfectly valid, it provided that £50 penalty should be recovered by civil process. The Magistrate had therefore no jurisdiction in the case and it was accordingly quashed.

Receiving Stolen Property.—William C. Fox, jeweler, King Street, Toronto, was arraigned at the Police Court on the 2nd Feby., on a charge of receiving stolen property. There were three informations against him, to all of which he pleaded not guilty, and elected to be tried summarily. The first charge entered into was that of receiving a seal cape, the property of W. A. Foster, knowing it to have been stolen. Mr. Foster testified to the theft of the article from his premises on the 22nd of last December, and Detectives Newhall and Hodgins testified to recovering the property in the prisoner's house, No. 193½ Yonge St. The defence was that it was sent there by prisoner's mother, who keeps a second-hand store on York street, without his knowledge. Fox's brother was put into the witness box. He swore that he placed the article in his brother's premises. He did not tell him that he had done so. His mother had sent him. Witness knew that the fur had been stolen and so did his mother when she bought it. The Magistrate inflicted a light penalty, only committing the prisoner to jail for twenty days. In the other two charges the prisoner withdrew his pleas of not guilty and similar sentences were passed on him, the terms to run concurrently.

A Daring Attempt at Burglary in Toronto.—Full information of the attempted burglary of Kent Bros'. jewelry establishment on Tuesday night, 31st January, discloses the fact that the attempted entrance was from the roof of the building. The thieves gained access to the roof by means of a ladder, taken from an adjoining yard, which they placed on the north side of the building. They first broke a pane of glass in the rear skylight over the upper show-room, but found their entrance barred by a stout grating which they could not displace. They then went forward to the ventilator over the front part of the building, and after inserting the jimmy which they had in their possession, forced the iron rivets of the fastenings and opened the door. Here again they were foiled, for directly under the doorway and over the mouth of the ventilator are powerful iron bars, so secured as to defy their efforts. About this time they must have received some cause of alarm, as the state of the surroundings as seen in the morning give evidence of a hurried departure. Leaving the door as they had forced it, they betook themselves to the rear of the roof and jumped from it to that of the adjoining building on the south side, from which they made their final descent. The ladder was found in the morning and returned to the owner. The building occupied by Kent Bros. is a new one, specially built for the purpose, and a more safely guarded establishment it would be difficult to imagine. The windows other than those facing Yonge street are all strongly barred with iron fastenings which are built in with the brickwork, and outside of this is an equally strong iron door.

WORKSHOP NOTES.

To Grind Glass.—A fine mat surface on glass may be produced by grinding the surface on a wooden wheel with wet silver sand.

Good Mucilage.—A tenacious mucilage for labels, suitable for bottles or glass, may be prepared by soaking glue in strong vinegar, then heat to boiling and add flour. This is very adhesive, and will not decompose when kept in wide-mouthed bottles.

MARK.

OBSERVE

this Trade Mark is stamped on all Knives, Forks, Spoons and other flat ware of our manufacture.

The A 1 Goods are Standard Heavy Plate, and XII signifies that in addition the articles have an extra quantity of Silver on all the parts most exposed to wear.

The Meriden Britannia Company have been awarded the highest premiums wherever exhibited, from the WORLD'S FAIR, 1863, to the PRESENT TIME, and the high reputation of our Goods throughout the world has induced other makers to imitate our Trade Marks and name as well as our designs, and as many of our patrons have, through a similarity of names, purchased inferior goods under the impression that they were our manufacture, we are compelled to ask especial attention to our Trade Marks.

THE FACT THAT OUR NAME AND TRADE MARKS ARE BEING SO CLOSELY IMITATED SHOULD BE A SUFFICIENT GUARANTEE TO THE PUBLIC THAT OUR WARES ARE THE BEST IN THE WORLD.

WE RE-PLATE OLD WORK AND MAKE IT EQUAL TO NEW.

CAUSE OF RUST.—The rusting of bright steel goods is due to the precipitation of moisture from the air. It may be obviated by keeping the air surrounding the goods dry. A saucer of powdered quicklime placed in an ordinary show case will usually suffice to prevent rusting of cutlery on exhibition therein.

ARTIFICIAL CORALS.—An admirably executed artificial coral has lately made its appearance in market, which cannot be distinguished from the genuine article, except when testing it with a file; they are made in Vienna and Paris, by mixing phosphate of alumina and phosphate of copper, and exposing the mixture to hydraulic pressure.

TO NICKELIZE IRON.—100 grams hyposulphate of nickel and ammonia and 50 g. salammoniac are dissolved in 4 quarts boiling water, and the bright iron pieces are boiled from one-quarter to one-half hour in it. The evaporating water is to be replaced, and if the articles are not yet sufficiently coated, the process is to be repeated.

RED STAIN FOR IVORY.—Dip the article first in the tin mordant used in dyeing, and then plunge into a hot decoction of Brazil wood—half a pound for a gallon of water—or cochineal, or steep in good carmine ink until sufficiently stained. For scarlet, use lac dye instead of the foregoing. Horn and bone may be treated in the same manner.

VARNISH FOR VIOLINS.—The famous Italian violin-makers used, it is said, the following sort of varnish on their instruments: Rectified alcohol, half a gallon; six ounces of gum sandarac, three ounces of gum mastic, and half a pint of turpentine varnish. The above ingredients are put into a tin can by the stove and frequently shaken until the whole is well dissolved. It is finally strained and kept for use. If upon application it is seen to be too thick, thin with an addition of more turpentine varnish.

THE name of aphthite, or unalterable, is given to a valuable alloy make at Marseilles, and which closely resembles gold in color and appearance. Its production is accomplished by placing in a crucible copper as pure as possible, platinum, tungstic acid in certain proportions, and when the metals are completely melted they are stirred and granulated by running them into water containing 500 grains of slacked lime and the same of carbonate of potash for every cubic metre of water. This mixture, dissolved in water, renders the alloy still purer. The granulated metal is collected, dried, remelted, and a definite proportion of fine gold added. For jewellery the material is almost unsurpassed.

OTHER NOTES.

DURING the six months in which the battle of Tel-el-Kebir was fought the receipts of the telegraph company which forwarded press dispatches to London was $290,000 more than in the half-year that followed. This fact is cited as an illustration of the extraordinary development of newspaper enterprise.

ONE of the three little machines which make most of the tiny screws used in American watches a man could carry under his arm without much difficulty. A wire fed through a tube into the machine is carried forward by revolving teeth. As it appears a knife cuts away the surplus metal to make the stem for the thread, just as the chisel operates at the lathe of the wood-turner. As this is finished a small tube in which the thread is formed advances and clasps the stem, forms the thread at lightning speed and falls back. As this is done two knives cut that portion of the wire off, and the completed screw falls down. The wire again advances, and the process is repeated. The marvel of the machine is best grasped when the size of the screw formed is understood. The largest are an eighth of an inch in length, and it would require 200 of them to weigh an ounce. The thread on the stem is so small that it is scarcely discernible to the naked eye.

"PUT IT ALONGSIDE THE THERMOMETER."—Brick Pomeroy, the well-known newspaper publisher, was troubled in his town with a business man named Jones, who would not advertise in his newspaper but patronized every Cheap John advertising scheme which was started. His card was in fine bold letters in the hotel register, and he had a space in the theatre programme and very laudatory descriptions of himself and his business in the various book advertising schemes which were issued in the town, and yet he did not seem to draw trade. Then the "thermometer in the post-office" man came along and roped in Jones for a large amount. One day Jones received a consignment of goods of extra value, which he knew would sell like hot cakes if he could only let the public know about them; so he made up his mind to beat a local notice out of Brick Pomeroy. Accordingly he called at the newspaper office and told Brick what a fine lot of goods he had and how cheap they were, saying. "The people ought to know about this, and you will be doing them a kindness by writing up a strong local on the subject." Brick said, "Certainly," and taking up his pen, dashed off a magnificnnt notice which quite tickled Mr. Jones. "Yes, yes, that's just it; that will fetch them; I will never forget your kindness." Then Brick Pomeroy, handing him the notice, said, "Yes, I think that's pretty good. Now go and stick it up alongside the thermometer in the post-office where you advertise.

JEWELRY STOCK
FOR SALE.

Tenders will be received until noon on the 1st day of April at so much on the dollar of the invoice value for the stock in trade and fixtures of the late Robert Shaw, of Clifford, Ont.

The Stock List and Goods may be seen at the warehouse of McNaught & Lowe, 16 Wellington Street East, Toronto.

Editorial.

A NEW IMITATION IVORY.

Every person in the jewelry or hardware trade knows by experience that Ivory is getting scarcer and higher in price every year, and it seems to be only a question of time when it will be beyond the reach of all except the favoured few who enjoy "a prodigality of wealth beyond the dreams of avarice."

We pointed out in one of our editorial articles about a year ago, that the great want in this line was some substitute for Ivory that would closely resemble it and still be low in price and impervious to the effects of heat or cold. The only substitutes at present in the market are hard rubber and celluloid, but while the former is first-class in every other respect its color (black) bars the way to its general adoption. The color of celluloid is fairly white, but it lacks the good qualities of the hard rubber inasmuch as it soon discolors and shows the slightest scratch. Could any person invent hard white rubber, they would not only have a magnificent substitute for Ivory but an invention that would, if properly handled, prove more of a bonanza than many a gold mine. We are glad to hear from our esteemed contemporary *The Ironmonger*, that English enterprise and invention have practically solved this difficulty and that to-day there is being manufactured in that country an imitation ivory that can scarcely be distinguished from the genuine article. Says the *Ironmonger* in an editorial article: "If, however, a sample of a new composition which has been submitted to us is all that it appears to be, we have no hesitation in saying that the Gordian knot has been cut, and that Ivory has for the first time been artificially imitated with success. This substance we have seen in the shape of a handle fitted to an ordinary table-knife, and, except by the closest examination, it would be impossible for an ordinary person to distinguish it from an ivory-handled knife of the best class. We have arrived at this conclusion after inspecting the knife both by daylight and by gas-light. Hitherto the so-called examples of imitation ivory have been, whatever their hue, damned at first sight by the dead opaqueness which is the characteristic of putty, and which, to everybody at all familiar with the semi-transparency of the surface of ivory, was alone sufficient to brand it as a failure. The new material under notice is innocent of this cardinal defect. It takes a beautiful polish, while directly underneath the glossy surface there is something of that partial transparency which is most pronounced in ivory of the rarest kind. This quality is by no means so conspicuous in the imitation as in the real thing. If a handle of Angola ivory is held to the light, the tang of the blade is plainly visible from bolster to point, and even when lying on the table the mark looms through the creamy hafting, like the central vein at the back of the hand. In this new substitute the tang cannot be discerned before the strongest light; and while this will always be a sufficient test of real ivory, this "short-coming" may be regarded as being an advantage."

The above reads well and it seems as if the new article will fill the bill in every respect. If it does it will be a good thing for the general public who want to put on a certain amount of style in the matter of white handled cutlery without paying the long price at present demanded for the real ivory. Of course this new substitute is yet in the experimental stage and we await further development with interest.

BILLS PAYABLE.

Elsewhere will be found a letter from an esteemed correspondent in another city, who complains and apparently with a good deal of cause, of the way in which some retail merchants look after, or rather neglect to look after, their paper when due. Nearly four years ago we took up this very same subject and we do not think that a repitition of the gist of the article would be out of place at the present time.

It is certainly an important subject and all the more important because that in these days of modern enterprise when merchants like every one else have to discount the future, a man's promise to pay, if put upon paper, possesses a certain intrinsic value, which business men are not slow to take advantage of. A merchant's promissory note like any other article of merchandise has a certain value, and this value depends entirely upon the confidence which the purchaser has in the ability of the maker to redeem it. The paper of a merchant who has capital enough to run his business, and the reputation of meeting his notes promptly as they mature, is always in demand, and as a result his credit stands him in good stead when he comes into the wholesale markets to purchase the goods necessary for him to carry on his business. A merchant's credit now-a-days depends almost entirely upon his method of meeting his payments, and no more certain commercial barometer could be desired than that furnished by his method of dealing with this matter.

Credit is a delicate plant, and one moreover that requires to be carefully watched and guarded in order to keep it healthy and flourishing. Many a dealer who is probably "good enough," for all he owes, has succeeded in almost ruining his own credit by sheer carelessness and neglect of ordinary business precautions. If he has a note maturing, it is not only possible, but extremely probable that he is entirely ignorant of its amount, and the day on which it is due. If he is aware of these facts he may probably put off hunting up funds to meet it, until it is too late—the result in either case is that he is forced to place himself under a compliment to the wholesale dealer to protect it for him or it is protested for the non-payment, and his credit irreparably injured. Now, no merchant fit to be in the business at all, would ever desire his

paper to be protested for non-payment if it could be avoided, and we are satisfied that many of our commercial delinquents err rather from want of knowledge than intent. To such we offer a few simple rules which will make such transactions much more satisfactory both to the wholesale dealer and themselves.

First, then, *every merchant should keep an accurate account of his bills payable.* For fifty cents a specially prepared book can be had which will show at a glance what you owe and when and where it becomes due. To be of any service at all this book should be accurately kept and ought to be a complete record of each note or draft, telling its date, amount, where payable and when due. *The proper time to enter these details is when you are signing a note or accepting the draft.* It should never be left over for a more convenient season, for such a time never comes, and further this is the only time when it can be accurately performed. It would be considered folly for a merchant to leave all his credit sales till the close of the day's business, and then attempt to enter them from memory, but such a thing would be no greater an indication of folly than for him to expect to make a record of his bills payable in a similar manner. The former would result in loss of money, and the latter in loss of reputation and business prestige, a thing no merchant who has any ambition would ever desire. Very few first-class wholesale houses now-a-days advise their customers of the maturity of their own notes, as such a notification would seem to imply that they regarded the makers as either incompetent or forgetful, and where such a course as we have pointed out above is pursued, it is entirely unnecessary, as the merchant himself has a complete and accurate record, which he should carefully examine day by day.

Second, *provision for the payment of any note or acceptance should never be left off until the last minute, but should be arranged one or two days before it is due.* If you can pay it in full so much the better for all concerned; it is but just to yourself and the wholesale dealer who endorses it, and it is better to know it before you are called upon for the money.

If, unfortunately as sometimes happens, you are unable after all your efforts to meet it in full, you should arrange with the wholesale dealer at least one day before it is due. Some people have a bad habit of leaving such things off until the last moment, and then when they find themselves stuck, telegraph to the wholesale dealer to recall the note. Such merchants seem to think that the wholesale dealer has nothing else to do, but to attend to their individual notes, while the fact is, he may have several other similar applications for favours on the same day. Such a practice cannot be too strongly condemned, as it is unjust to the wholesale dealer and unbusiness like in the extreme. If after your best efforts you feel satisfied that you cannot meet your obligation in full, you should at once communicate with the wholesale merchant and let him know the best you can do in the matter, next to payment in full. *Such a thing should always be done before but never after the note is due.* This is the most satisfactory method of settlement; and it is but just to the wholesale dealer who has the whole financial part of the business on his shoulders.

Bad as the merchant may be, who, while doing his utmost to raise the money, leaves it off till too late, and is then forced to apply to the wholesale dealer, he is a king compared to him whose ignorance keeps him unconscious of his obligation, or whose carelessness make him indifferent to it. In either case the result is the same and is discreditable to the individual. For the merchant who honestly tries his best to pay his bills as they mature, there is usually consideration and assistance, but for the other class who systematically ignore all such conventional usages there is rarely either the one or the other.

As we have endeavoured to show, it is just as easy, and certainly more business like and agreeable, to transact such business properly so as to afford general satisfaction instead of constant worry and annoyance, and we are satisfied that if some of the retail merchants who find these matters going wrong, were to practically adopt these simple suggestions, they would find such business simpler and much more satisfactory.

Selected Matter.

"SHOVING THE QUEER."

A BLYTH JEWELER ARRESTED FOR OFFERING BOGUS MONEY.

Hamilton Spectator.

On the morning of Tuesday, Jan. 29 last, a *Spectator* reporter and a friend dropped into Messrs. George Lee & Son's restaurant to get a glass of beer. The beer was drawn, and while they were drinking it Mr. Lee, sr., went into his office and brought out a plain envelope which bore the superscription, "Best Billiard Parlor, Hamilton, Ont." This Mr. Lee handed to the reporter, saying, "Here is something you might make an item of." The reporter took it and found inside the following circular:

Dear Sir:—My confidential agent gave me your name, he said you was a man of BUSINESS and in a position to handle our GOODS in safety. If we have made a mistake do us no harm and let the matter drop. Never try to injure a man who is willing to prove himself your friend. The articles we deal in are ONE'S and TWO'S of the Dominion of Canada, ONE'S and TWO'S United States Treasury notes, FIVES and TENS of the Bank of Montreal and Commerce. They are for every practical purpose as good as the genuine article, and there is not three experts in Canada who can detect them. The business is perfectly safe, but like all other paying speculations (not exactly legitimate.)

We will deliver the goods to you PERSONALLY, and see you safely out of town before asking you for one cent.

If you are willing to engage in the business write to me, and I will send to you full particulars as to price and how you can find me.

Yours confidentially,
W. A. GARLAND,
Blyth, P.O.

With it was the following note:

Dear Sir:—If you will paste up the enclosed circular in a conspicuous place, so that it will not get torn down you will hear from me again ere long.

Don't obliterate the address. In confidence,

W. A. GARLAND,
Blyth P.O., Ont.

Although it was no doubt particularly gratifying to Mr. Lee to have his billiard parlor recognized by the local postal people as the best in town, and although that fact would naturally put him in good humor, he could not reconcile the address with the opening words of the circular, "Dear Sir:—My confidential agent gave me your name, he said you was a man of BUSINESS," for billiard parlors, whether they are the best in town or not, are not commonly addressed as "dear sir," nor alluded to as men of business. Well, the reporter finished his glass of beer, put the circular in his pocket and went out. Shortly afterwards he sent the following telegram to the editor of the Blyth Review: "Got circular here offering 'queer' money,

ASK YOUR JOBBER

FOR QUIGLEY'S NEW PATENT

Invisible Joint Case,

THE FIRST

DUST PROOF HUNTING WATCH CASE

EVER MADE.

This Case is made in Key or Stem Wind,

HUNTING OR OPEN FACE

WEIGHTS IN SILVER, 3 oz., 4 oz. & 5 oz.

IN GOLD, ANY WEIGHT OR KARAT.

signed W. A. Garlaud, Blyth. Who is he? Wire answer 100 words and write immediately to *Spectator*, Hamilton." To this message no reply came up to the hour of going to press, and so a brief item was put in the paper to the effect that circulars were being sent out from a village in Ontario offering bogus mouey, and adding that the case was being worked up. Along in the afternoon, however, a telegram came from the Review man, saying that no such person was known there and that the name Garland must be an assumed one.

A letter was sent to constable James Davis, explaining the matter fully and asking his aid. Mr. Davis sent the reporter a lengthy reply, telling him of the person he had reason to suspect, and proffering his services and best help in any scheme got up to get on the rascal's tracks. The following letter was sent to Garland :

HAMILTON, Feb. 9, 1884.

W. A. Garland—Blyth—Dear Sir—I seen one of your circulars, and maybe you and me can do some business. Of course we must do it all on the quiet. I seen a bit in the paper here which I guess was about you, but that will put them off the track because they won't think I would go in right here. Of course I don't want much of the queer ones, but how much would you send me for $5.00. That's all I'd want to start on. But be sure and keep this quiet on the dead between you and me. When you write send to——here. Write to F. W. Johnson.

The letter was received by Mr. "Garland," and in a few days the following letter and circular, with a slip from a newspaper enclosed, reached this office. The letter runs :

Feb. 12, 1884

Friend No. 48 :—Your letter received all o.k. We send not less than One Thousand Dols. Price Oue Hundred Cash, or can give you ten thousand for $500. Bring all the cash you can, as our goods are right and we can guarantee you a safe and rapid Fortune. I enclose instructions how to find me. If you cannot come yourself, you might send a Friend that you can trust to do the Business for you. Would much prefer if you could make it convenient to come yourself. Iu case you canuot come and see me aud would like to handle our goods, if you enclose me Ten dollars as a guarantee of your good Faith, I will send you prepaid by Express, a tin sealed Package containiug $100 of our goods. This will convince you that the business is safe, and you can then come and see me. Enclose money in black bordered Envelope, and do not Register. It will reach me all right. Thanks for your information about newspaper article, but we are too old heads for papers to bother very much. Yours in all confidence, W. A. Garland, Blyth.

The circular enclosed ran as follows :

READ CAREFULLY.

In order to meet me, it will be necessary to follow these instructions to the very letter.

1st.—Write me at least two days before leaving home, and mention name of hotel you will stop at.

2nd.—Arrive in town in the evening if possible, register your name, and SEE that the number of your room is opposite your name. Don't neglect this, or I could not find you, as I will only know you by your doing as I tell you, and can see you in your room only.

3rd.—Have no conversation with anyone after arriving in town. Should you see anyoue you know, don't recognize them, as I do not wish you to speak to anyone, not even if they know your name. I will know by your letter when you will be here, and will be on the lookout for you. When I meet you in YOUR ROOM I will hand you your last letter, stating you were coming, and when you see your own writing you will know you are dealing with the right party; don't mention your business to anyone until you see your own letter. If you do this there can be no mistake, as our business is only known by you aud me.

4th.—I will call upon you between 7 and 10 o'clock in the evening. Should I not call the first evening you are here, don't be alarmed, but in the morning drop me a sealed note in the post office box saying you are in town at the Central hotel, as I might be seeing some other agent who is ahead of you. It is absolutely necessary for you to REMAIN IN YOUR ROOM BETWEEN THESE HOURS.

5th.—I am busily engaged on Saturdays and Sundays, and cannot meet my agents ou either of these days; when you come to see me be sure to reach town on other days ! !

6th.—Read this carefully and be sure and follow my instructions; if it was not absolutely necessary for you to do so, to ensure success, I would not be so particular.

7th.—Do not enquire for me at any address, as I get my letters through a friend, who kuows nothing whatever about my business.

8th.—You are at liberty to stop at any hotel you wish, only let me know which one you are at.

9.—Never sign your name to letters after I once have your proper address. Use No. 48. I will know who it is from.

Yours in confideuce,
W. A. GARLAND,
Blyth P.O.

The reporter hardly knew what to make of this communication. He was pretty well satisfied from the general tone of it, that the man had no bad money and that his sole idea was to work the $10 racket. When he got the money he would let the sender whistle for his tin sealed package, and as express instructions were given not to register the letter, even if the queer money did come for the $10 sent, he would be no nearer what he wauted than before. It was altogether probable, he thought, that if he went up to Blyth, "Garland" would fail to show up, and his time and money in going up would be spent on the finding of a fine, big mare's nest. But this was the only way he saw of getting at the man at all. There was just a chance that he might show up, and he thought it better to take that chance than give the thiug up altogether. If the letter had been registered it would have been a different thing. The fellow could have been got at then easily enough, but he was too cunning for that. Indeed, his letters and circulars show that he is a pretty sharp and tricky individual. In the meantime the reporter had written to his friend in Blyth, telling him about the latest circular, and the friend sent him a letter which made him decide on going up at once. Thursday evening a letter was posted to Mr. "Garland," stating a "Mr. T. A. Ryan" would reach Blyth Monday evening, and would be at the Central Hotel, as requested. "Mr. T. A. Ryan" was the official representative of the SPECTATOR. The letter was signed "48." Ou Monday the reporter left.

Special Telegram to the SPECTATOR.

BLYTH, FEB. 26.—The bait took. The reporter went to the Central Hotel, as requested, and was put in room 4. About 9.30 there was a knock at the door, and a small man, dark, good-looking face, long black moustache, and neatly-dressed, entered, locking the door and saying : "You are Mr. Forty-eight." "I believe so," said the reporter; "you are Mr. Garland ?" "Yes, here's your last letter." He then entered into conversation, and said the business was done 40 miles from here, and was run by five men ; that it was done by a patent photographic process. He produced a negative of a Molson bank bill for $10, and a marked copy of the *Globe* of Sept. 8, 1883, saying a process had been discovered for taking photographs in natural colors. The

The Derby Silver Co.,

M. W. BARTLETT, Manager.

colors are produced by the action of light alone in the camera, owing nothing to the artist's pencil. The photographs taken were true to nature, and the delicate tones and shades were clear to view. "Garland" said he had no money with him, as he was certain that busybodies were suspicious, but he arranged to have $10,000 worth in a day or two,for which the reporter was to whack up $600. "Garland" said he was not afraid of any trouble, because any person wanting to buy was as liable as he was, and he got his letters through a local business man, who forwarded them to him 40 miles away. He went down stairs. The reporter followed in a few minutes and described his visitor to the constable, who at once arrested Mr. "Garland," whose real name is O. G. Martin, and who for some years has carried on business here as jeweler, bookseller, etc. The photographic plate, paper, and the reporter's last letter, were found in his possession.

At a preliminary examination this morning before Magistrates P. Kelly and Wm. Drummond, the prisoner had nothing to say. The evidence of the reporter, the constable, and D. B. McKinnon, postmaster, was taken, and Martin was committed for trial. The postmaster testified that Martin had been in the habit of getting letters addressed to W. A. Garland. Martin does not bear a particularly good reputation locally, and many have thought sometime back that he was the "queer" person, for the matter has been an open secret around here for a long while. It is freely stated that others are mixed up with him. Neither counterfeit money nor circulars were found in his premises when the constable made search. He took his examination coolly, and didn't seem the slightest bit worried at the serious charge. He stated in the hotel room that he had been carrying this on for a year and a half. He said he got American greenbacks and photographed the faces of Canadian bills so that the difference was impossible to detect, unless a banker by chance struck two with similar numbers.

It is believed that Martin has no counterfeit money at all, and that his game all along has been nothing but shrewd playing on human gullability

Up to the last few months he has been poor; since then he has blossomed forth as a rosebud bursts and blooms under the loving rays of the June sun. He has furnished his house handsomely, got in a fine piano, and largely increased his stock. His living expenses generally became more expensive and people wondered where the money came from to keep this reckless grandeur going. He certainly didn't take it in his business, and no word had come of his having been left a fortune. Of late all sorts of suspicious rumors have been flying about, and last night and to-day the crash came and the "mystery" was revealed.

The post-office inspector came to the village some four months ago and spoke to the postmaster about the matter. At first he said that all the letters that came addressed to W. A. Garland were to be sent to Toronto, but afterwards said the Act gave him no power to interfere in the matter, and told the postmaster to continue giving Martin the letters.

He was taken to the Huron county jail, in Goderich, in the afternoon, by constable Davis, where he will await his trial at the next assize court, which commences April 1. He was committed for trial under 32 and 33 Vic., chap. 19, secs. 19, 20 and 21, which provides that any person who offers counterfeit money for sale, or has a "die" of any description in his possession is guilty of a felony.

* * * * *

O. G. Martin, alias W. A. Garland, of Blyth, who was detected in a counterfeit scheme by a reporter of the Hamilton *Spectator*, has been released on bail, bonds having been furnished by himself in $4,000, and by H. Wells, of Saltford, and Elijah Martin, of Goderich, for $2,000 each.

Correspondence.

Mr. Editor,—

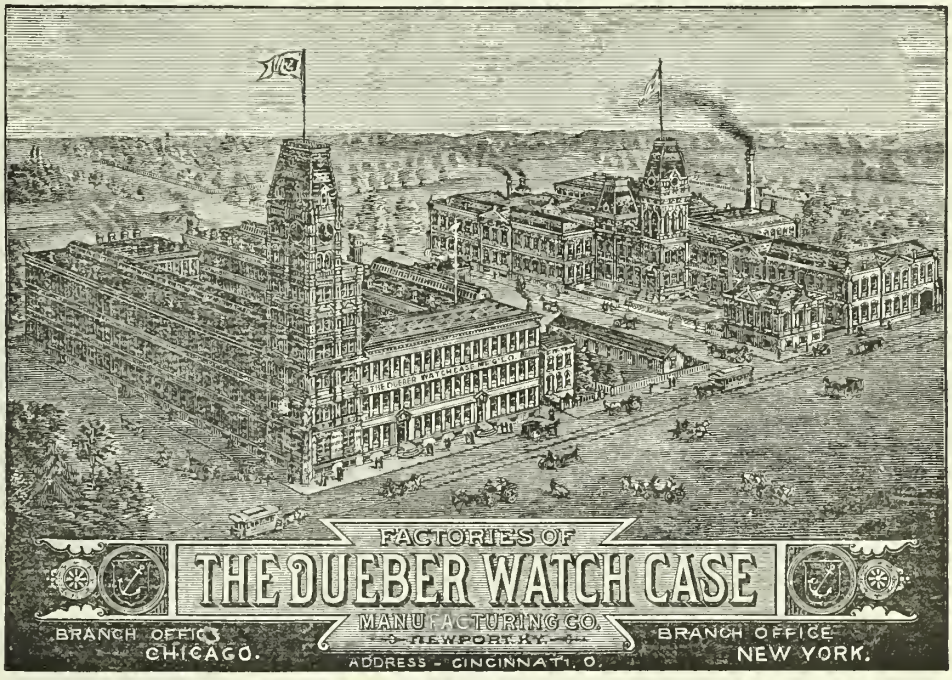
Sometimes I imagine that a great many of the retail jewelers of Canada do not understand the true nature of a note, or the use it is put to by the wholesale dealer. If they think it is taken merely as an acknowledgment of an account, and placed into the safe of the creditor till it becomes due, it perhaps would be just as well to enlighten them to the contrary. Wholesale dealers have their obligations to meet, and to enable them to do so, they transfer the notes of their customers to their banker, who converts them into cash, and places the amount, less the discount, to the credit of their account. This cash is checked out in payment of liabilities, or for the purchase of other goods, as the case may be. When these notes come due it is expected, and absolutely necessary, for the retailer to meet them on time, otherwise it is just the same as the wholesale dealer putting his hand in his pocket and lending the amount in cash to the former. After buying goods on three and four months' time, which is sufficient for the prudent and careful buyer to convert enough goods into cash to meet his payments, it is nothing but right and fair that provision, by an extra effort, if necessary, should be made to meet his obligations promptly, and save his creditor the inconvenience and embarrassment of having his note go to protest. Some dealers seem to take no notice of their notes coming due, and in about a week, after they receive word from the notary that their note has gone to protest, they coolly send a renewal, stating that it was inconvenient to meet the said note, and asking rather impertinently, with the air of assumed anger, "why their note was not taken care of," while others treat the whole matter with silent contempt; they seem to think, like Macawber, that when they gave their note of hand, they have performed their whole duty by their creditor. Now, Mr. Editor, the sooner the merchant finds out that this continued renewing business is only the beginning to an end, which will sooner or later wind up in bankruptcy, the sooner he will stop short, take stock, buy only what he really needs, and give less credit.

Yours, &c.,

A Jobber.

BUSINESS CHANGES FOR MARCH.

P. Patterson & Son, Hardware, Toronto, assigned in trust; C. Freeman, Hardware, St. Marys, Ont., sold out to Hamilton & Haight; John Edgar, Jeweler, Liverpool, N. S., burned out; Lane & Bass, Jewelers, Brockville, Ont., dissolved, Lane continues. Hannah & Knapp, Hardware, Shelburn, Ont., dissolved, Hannah continues the business; Wood Bros., Leather Cases, dissolved, W. F. Wood retires; Laing & Ruth, Hardware, and H. Tucker, Jeweler, Ridgetown, Ont., burned out.



THE LARGEST ESTABLISHMENT ON THE GLOBE FOR THE EXCLUSIVE MANUFACTURE OF

GOLD AND SILVER WATCH CASES

ARE THE FACTORIES OF

THE DUEBER WATCH CASE MANUFACTURING COMPANY,

NEW YORK OFFICE:
—20—
BRYANT BUILDING.

CHICAGO OFFICE:
—4—
TRIBUNE BUILDING.

CINCINNATI, OHIO, U. S. A.

More than Eight Hundred Thousand Gold and Silver Watch Cases, all stamped "Dueber," are now in the pockets of the people; and all having one in their possession can rest assured that they have the very Best Watch Case made. Quality exactly as represented, and workmanship superior to all others.

BUSINESS NOTES.

E. M. Blakely, jeweler, formerly of Picton, has moved to Trenton, where he proposes to push trade. The Trader wishes him success.

Decew's hardware store, in St. Thomas, was entered on the night of March 10th by burglars, who carried off a quantity of firearms, knives, &c.

The inscription "Thou shalt not steal" is conspicuously displayed in the window of a New York jeweler. A loaded revolver emphasizes the command.

Jewelry Store Burglarized.—John Cochcrane's jewelry shop, of Schomberg, was broken into on the 19th March, and about $600 worth of jewelry stolen. The thief effected an entrance by cutting an armhole through the back door just above the bolt.

We notice that Mr. T. J Wheeler, jeweler, of Georgetown, has lately fitted up his new store with all the latest modern improvements. Friend Wheeler don't propose to take a back seat, and Georgetown can now boast of as elegant a jewelry store as any town west of Toronto.

McIntyre & Davidson, jewelers, of Portage la Prairie, Man., are disposing of their branch business in Minnindosa, with a view of concentrating their business. This is a good chance for any enterprising man with a small capital.

The New York *Sun*, speaking of a long-drawn-out suit betwen two farmers, says: "When they began the case there were two well-off farmers and two poor lawyers. Now there are two poor farmers and two well-off lawyers."

Naturalization Papers. — Mr. Moses Schwartz, jeweler, of this city, swore allegiance to the Queen last month, took out naturalization papers, and became a British subject. Mr. Schwartz intends visiting his home in Russia, and for his own protection during his travels he became a Canadian citizen.

The sign originally adopted by the pawnbrokers was three pendent dices, gilded to represent gold coins. After a while the form was changed to three balls, that the objects might be equally conspicuous from whatever direction seen. These remain the emblems of the traffic to this day.

Failure of a Safe Manufacturer.—Godfroi Chapleau, safe manufacturer, has failed with liabilities of $40,000. At a meeting of his creditors the insolvent offered 35 cents on the dollar, which was declined. The embarrassments of Mr. Chapleau arises out of his investments in the Montreal abattoir enterprises, which turned out so badly.

The Result of a Similarity of Names.—Complaints reach us from several quarters of a person travelling for a small plate house in Toronto, who obtains orders from merchants by leading them to believe that he is the agent of the Meriden Britannia Co. Dealers should look out for such people, and make certain what Company they represent before they place any orders with them.

Saving His Capital.—"You're a goose!" angrily exclaimed an Austin man to his wife, who continually chided him about his excessive extravagance. "You do nothing but cackle, cackle, cackle all the time." "Yes, dear," she sweetly replied, "but you must not forget that the cackling of geese once saved the capitol of Rome, and if cackling can save your capital I'm going to keep it up." And she did.

Josh Billings forcibly observes that "before a man delibritly makes up his mind tew bee a raskal, he had better examine himself clussly in order tew ascertane whether he aint better konstructed fur a phool." If O. G. Martin, jeweler, of Blyth, had taken this into consideration before he went into his "queer money" speculation, he would have been better off today. Honesty is the best policy after all, as Mr. Martin's experience given in another column will show.

F. T. Bradley, Collector of Customs at Emerson, was arrested last month and brought to Winnepeg, charged with destroying the manifest of coal, the duty on which was many thousand dollars, and keeping the money. He was also charged with embezzling $4,000 of the Government's money. When brought to Winnipeg he was taken with convulsions and subsequently expired.

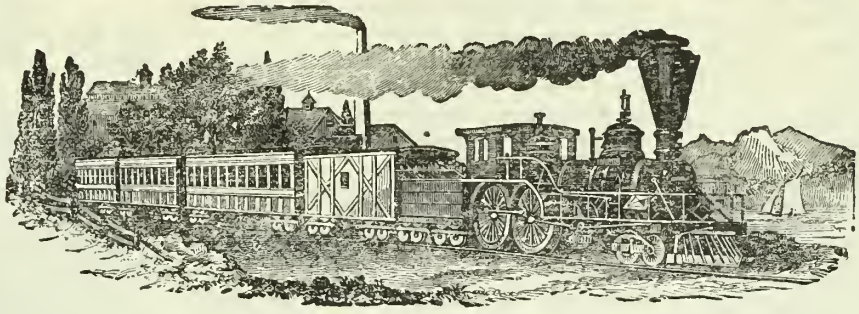
An investigation conducted by Inspector Mewburn, of Hamilton, shows Wm. Buchner, Collector of Customs at Fort Erie, to be out in his accounts $500. Buchner has always borne an excellent reputation until now. He once ran for the Ontario Legislature. He is about 35 years of age, with a wife and three children. He is supposed to have become embarrassed and borrowed the money to pay old debts. Buchner's bondsmen will be held responsible for the deficit.

The employes in J. & J. Taylor's safe works a few evenings since presented a beautiful marble clock, accompanied by a complimentary address, to Joseph Grove, for many years foreman and manager of the works, upon his retirement from his late position to open safe works for himself in London. Mr. Grove made a very appropriate acknowledgment of the presentation made him, and only hoped that his his new field in life might be productive of as much happiness as he had experienced in his late position.

The jewelry store of Abel Ashby, on Sandwich street, Windsor, was robbed last Wednesday afternoon of 24 watches, three sets of plated jewelry, two revolvers, a set of watchmaker's tools and a lot of assorted jewelry. The supposed thief is Randolph Malandur, who had charge of the store. Ashby did not discover his loss until several hours after Malandur had departed. He estimates his loss at about $212. Malandur has been in his employ but a short time. His home is in Montreal.

An official of the C. P. R. states that trains are now run east of Port Arthur as far as Nipegon, where they are stopped, as the bridge has not yet been built over the river there. Upwards of 10,000 men are at work on construction between Port Arthur and Michipicoten, to which point it is thought the road will be finished by this time next year. Work could be found for 500 additional men now, and in a few weeks for 2,000 more.

The latest "city of a day," Silver City, in the Rocky Mountains, is growing apace, Building operations are being rapidly pushed with a view to a rush of business in the spring. Four large mining companies are at work developing their locations, and have thus far met with unexpected success. Smelt works, shafts and outbuildings are being rapidly erected. Business men are arriving by every train. Property has risen and rents are high. Everything points, in fact, to the new city becoming a Canadian Leadville.



An Assignment.—The firm of Peter Paterson & Son, hardware merchants, has assigned in trust to M. & L. Samuel, Yonge street. It is claimed that the liabilities of the firm amount to only $5,000, exclusive of loans on real estate which are covered by mortgages. The assignment was precipitated, so it is said, to prevent the foreclosure by a loan company of real estate on King street, but there were other claims which would have rendered the action necessary in a short time The cause of the failure is alleged to be the limited capital on which it was attempted to carry on the business.

One effect of the cheapening of letter postage in the United States has been the reduction in the number of postal cards used, the falling off since July 1st being over three million and a half. The increase in stamps used during the same period has been 18 per cent., and of stamped envelopes 25 per cent. The loss on the reduction will probably be merely temporary. It is not to the credit of Canada that we still keep up the three-cent rate while our neighbors are enjoying the advantages of two-cent postage.

At El Paso, Mexican dollars are worth 85 cents in American coin. At Paso del Norte just across the river, American dollars are worth 85 cents on the dollar in Mexican coin. One morning a car-driver started from the American side with a Mexican dollar. On his arrival at the Mexican town he took a drink of chain lightning, which was fifteen cents, and received an American dollar in change for his Mexican. On his return to the American side he took a drink of equally bad liquor and received a Mexican dollar for his American, and so repeating the drinks at intervals during the day, and at night he closed up business with the Mexican dollar he started with in the morning in his pocket.

In London, although the jewelry trade is somewhat languid, the leading jewelers are taking the opportunity of refitting up their places and be ready for the rush when it does come. A. S. Murray leads the van in the way of improvements, his fixtures being extremely elaborate. Trebilcock is pushing things as usual and expects to be able to meet all the requirements his customers may make. Morphy has improved his stand, certainly the best in the city for his business, until it presents the appearance of Broadway enterprise that our cousins across the border are slow to give us Canucks credit for. And McCloghlon, we were almost forgetting him, has got his sextant, or quadrant, and all his other ancient paraphernalia burnished up, and in his window, ready for the opening of spring navigation or anything else that turns up. In spite of his wonderful bargains of goods below cost, a friend of ours managed, last week, to press his way into McGloghlon's store, and

found out that his extra cheap watch was just out, but that plenty more were *en route*.

An important judgment to commercial men was delivered in the Superior Court at Montreal last month by Mr. Justice Johnson. Some time ago James Murray, a dry goods merchant there, finding himself in financial difficulties, made an assignment of his estate to assignees for the benefit of his creditors. Subsequently a party to whom he was indebted to a small amount sued and got judgment. A seizure was then immediately placed on the assets in possession of the assignees, when the latter applied to the court to set it aside. The court had the case under deliberation for some time, but has at last decided that there is no law in that province to prevent a creditor getting his own. The seizure was upheld and the assignees condemned in costs. This decision will cause great confusion when an insolvency takes place, as it will devolve on every creditor to take care of his own interests. If the judgment is confirmed, then an insolvent law for the distribution of assets becomes an absolute necessity, or otherwise estates will be swallowed up in law costs or sheriff's fees.

Seizure of Smuggled Jewelry.—Messrs. O'Hara, pro-collector of Customs, and Mr. Sidmark, landing waiter, last month made a seizure of $1,500 worth of gold watches in Montreal, which had been smuggled across the border. The valuable consignment has been confiscated, but no prosecution, it is said, will be instituted. It would appear that notwithstanding the vigilance of the Customs officials for a considerable time past and the many attempts at smuggling that have been detected such fraudulent dealing cannot be suppressed. Heavy penalties on the offenders should be imposed as well as the confiscation of the goods. It is well known that a jewelry firm in that city in the course of some years made an immense fortune out of the most systematic smuggling, and that all the government could get out of them ultimately was $12,000 or $15,000 for their operations for twelve or fifteen months, only before they were defeated by Mr. O Hara, who has again signalized himself in this seizure.

WORKSHOP NOTES.

To drill holes in glass, take a good steel drill and wet with a saturated solution of camphor in oil of turpentine. It is said that holes may be rapidly drilled in this way through the thickest plate-glass.

White of Egg, heated to 212 degrees, and kept there a while, will become dry, shrunken and horny. If the heat is carried a little further, it becomes converted into a substance which is so hard and tough that a valuable cement is obtained by simply smearing the edges of the article to be cemented with white of egg, and heating it to a little above 212 degrees. You can test the heat by a touch of your finger if you think best.

To Temper Lamp Chimneys.—A Leipsic journal gives a method which, it asserts will prevent lamp chimneys from cracking. The treatment will not only render lamp chimneys, tumblers, and like articles more durable, but may be applied with advantage to crockery, stoneware, porcelain, etc. The chimneys, tumblers, etc., are put into a pot filled with cold water, to which some common salt has been added; the water is well boiled over a fire and then allowed to cool slowly. When the articles are taken out and washed they will be found to resist afterward any sudden changes of temperature.

OTHER NOTES.

At Krupp's celebrated foundry mountain guns are finished in two months after work on them is begun, while two years are required to manufacture a 16-inch gun of 35 calibres length. This apparently long time is made necessary by reason of the large surfaces that have to be worked over on a steel cannon of this description 55 feet long and weighing 121 tons.

The temple of Jerusalem, writes a Paris correspondent of the Boston *Pilot*, is to be rebuilt by the combined efforts and contributions of twelve American millionaires, two of whom have already gone to Palestine to study on the spot the most efficient means of putting into execution their gigantic and costly project.

Paris is regarded as the foremost in the absolute provision for manual training in connection with primary schools. Over a hundred schools in the French Capital are now provided with workshops. At present they turn out articles of wood from planing benches and lathes. It is proposed soon to add iron to the material to be operated upon. This manual training is an addition to the ordinary studies of a primary school; the boys appear to like it, and it gives a new form of activity to their minds and valuable exercises to their muscles.

At a recent meeting in Boston, Dr. Bowditch, of Harvard College, exhibited a series of magnified impressions made by the finger-tips belonging to different persons. It was shown that the finger-tips are as distinctive as the face, and that they change less than the face in a given period. Dr. Bowditch showed impressions made with his own fingers fifteen years ago, and they differed but little from those freshly made by him. It is suggested that if every family would preserve impressions of the finger-tips of its individuals, they would be valuable for purposes of identification in the event of a disappearance and a subsequent dispute as to identity.

What Will Burst a Gun.—Some strangely twisted pieces or gun barrels in a window on Chestnut street exhibit in most interesting fashion the vagaries of overtasked gun barrels. These specimens are part of some guns burst by Captain Heath, of Philadelphia, during some protracted experiments with various weapons. Five of the barrels were burst because a ball was "stuck" over the muzzle in each case, two gave way because about four inches of snow was put in the muzzle, two were burst by reason of having some wet sand at the muzzle. Sportsmen often scoop up a little mud or sand unconsciously, bang away at game, and are then astonished to find the gun with a ragged and shortened barrel.

Editorial.

THE CREDITORS' RELIEF ACT.

The late session of the Ontario Legislature, although more fruitful of political clap-trap than real legislation for the good of the Province, should receive credit for at least one good deed, viz.: the bill to put in force "The Creditors' Relief Act of 1880." Our readers will remember that when in 1870 "The Dominion Insolvent Act" was repealed, it at once became apparent that if nothing were done by the Provincial Legislature to prevent such abuses, that the fair name of Canadian merchants would be seriously damaged by the old abuse of preferential creditors and assignments. In order to prevent this as much as possible Mr. Mowat in 1880 introduced his Creditors' Relief Act above alluded to, which was intended as a check upon such practices, and was supposed to come in force as soon as proclaimed by the Lieut.-Governor of Ontario. Although there was much speculation at the time as to the power of the Ontario Legislature to pass any such measure, it is stated that it was informally agreed between the Ontario and Dominion Governments that the latter should legislate in such a manner as to remove any doubts upon the subject, and that on this being done the Lieut.-Governor's proclamation was to issue.

The Dominion Government however not being strong enough in the back to resist the clamor of the lower Canadian members for a continuance of the repeal of the Insolvent Act, nothing has been done in this direction by the Government themselves, although each session has furnished its quota of private insolvent bills, which have been quietly strangled along before the Usher of the Black Rod has had his final opportunity of posing before the members at three hundred dollars per bow.

In the meantime, as every reader of THE TRADER knows, fraudulent preferences have in many cases been the order of the day, and this state of things has done not a little to curtail trade at home and injure Canadian credit abroad. Indeed in the case of British creditors it is an open secret that quite an agitation has been raised in the mother country to discontinue credit sales in Canada altogether until English creditors were placed in as good a position as those in Canada.

"Urged by the necessity of the case the Ontario Parliament at its session just closed decided to wait no longer for Dominion legislation, but to put the Creditors' Relief Act at once into force. Accordingly the clause about the Lieutenant Governor's proclamation was repealed (Administration of Justice Act, 1884, sec. 2), and the Creditors' Relief Act thereupon came into force and is now the law of the land. It does not affect the rights of execution creditors under writs of execution delivered to the sheriff before the Act came into force on 25th March last.

The object of the Creditors' Relief Act is to abolish priority of and among execution creditors. It provides that a sheriff on executing a writ shall keep an account of money received and shall divide it rateably among all execution and other creditors whose writs, or certificates under the Act, are placed in his hands within one month from the date of the entry in his books. If a debtor permit an execution to remain unsatisfied till within two days of the time fixed by the Sheriff for the sale of his goods, other creditors may proceed in the following manner in respect of debts which are overdue:—

An affidavit of the debt is to be made by the creditor; a certificate is to be obtained from the Sheriff showing that such proceedings have been had against the debtor as bring him within the Act; a copy of the affidavit is to be served on the debtor; the affidavit and Sheriff's certificate are to be deposited with the County Court Clerk. Then if, within ten days after the service, the claim is not disputed, the County Court Clerk will deliver to the creditor a certificate of the claim; this certificate is to be delivered to the Sheriff, and, from the time of such delivery, the claimant is to be deemed an execution creditor, and entitled to share with other execution creditors. On receiving the certificate the Sheriff is to make further seizure sufficient, if possible to satisfy the new claim. The object of this procedure is to avoid the expense of unnecessary suits. In case of the debtor disputing the claim he is to file with the County Court Clerk an affidavit stating that he has a defence, and the question will be decided by the County Court Judge; or where there is a dispute as to material facts, or when the sum in controversy exceeds $400, the judge may send the matter to a superior court.

A Division Court judgment is to entitle a creditor to equal rank with a creditor holding a County Court judgment.

The judge is endowed with power to grant time to the debtor where this can be done without injustice to the creditor.

The procedure under the Act is exceedingly simple and inexpensive, and while affording creditors all the protection which it is in the power of the Legislature to grant, will not be oppressive towards any honest debtor.

It is but fair to add that the clause in the "Administration of Justice Act, 1884," which brings into force the Creditors' Relief Act, was passed with the unanimous consent of both sides of the House."

THE COMING METAL.

Although aluminum has long been known as one of the most useful of metals, the difficulty of obtaining it has hitherto proved an almost insuperable obstacle to its general use. It appears however, that scientific research has overcome this objection and aluminum can now be obtained in quantities sufficient for the present necessities of trade, and at prices far below its former value. If all, or even half is true, that is claimed for it, this metal which may almost prac-

tically be regarded as a new one, has a great future before it, and bids fair to rival iron in its wide range of adaptability. For many purposes it must certainly supersede all metals in present use, and if the price can be reduced low enough to bring it within the reach of the practical trades it will give iron and steel a hard race for supremacy. The manufacture and development of this metal is still in its infancy, and we await with a great deal of interest, its introduction on an extended scale into the manufactures of the world. Manufacturers have long been looking for some such metal, and if this fills the bill its success is assured from the start. In this connection we clip from our esteemed contemporary "The Watchmaker and Jeweler," of London, England, the following account of this metal, which may prove of interest to our readers :

"Aluminum, with one exception, is the most abundant metal known. The material, alumina or clay, from which it is produced is not confined to any locality or country. It is found everywhere. It is more than half a century since the eminent German chemist, the late Frederich Wohler, who for fifty years was Professor of Medicine and Director of the Chemical Institute at Gottingen, discovered aluminum and that it could be produced from common clay and from alum and still it is among the least familiar of metals. Its usual price is £4 per pound, and until the past year it has only been known as "aluminum gold." After many experiments extending over a series of years its manufacture was abandoned, except in one instance, to the French, who only produced it in inconsiderable quantities. After more than thirty years' labor and at a cost of more than £250,000, the eminent chemist and metallurgist, James Webster, has discovered a method of making aluminum by burning or roasting alum, instead of making it in the old and tedious way by precipitation. By the new process it takes only one twenty-fourth of the time required by the old method and costs less than one-tenth as much. Instead of producing the alumina powder by the old and slow method of precipitation, Mr. Webster burns the alum with pitch in a calcining or roasting furnace, prepared expressely for this purpose, the product being a grey ash or powder, in appearance much like the ashes or cinders from an engine furnace. This grey powder, according to all scientific authorities, is no more or less than burnt alum. By another process this ash is converted into another product, which contains from eighty-four to ninety-five per cent. of the alumina, having left behind it several bi-products, which nearly pay the cost of working. The alumina thus produced is better than by the old method of precipitation, in that it is much finer in texture and almost entirely free from silica. The discoverer has been producing 200 pounds of alumina per week for more than a year, the value of which is £4,000 or £208,000 per annum, the result of which has been that at the present time a manufactory which covers more than one-half an acre is kept busy night and day, with orders for more than fifteen months' work. The present output is twenty tons of aluminum metal per week. From the results already obtained by the aluminum bronze factory (near Birmingham) it is plainly evident that in a very short time this almost new and peculiar metal, which never oxydises or corrodes, and which never tarnishes under any circumstances, to which can be given the color of gold, silver, bronze, or purple, and which differs from all other metals in that it is never produced direct from ore, but only by a long and elaborate process, must become an important factor in the manufacture of jewellery ; and not only so, but that almost every article made from metal, from the screw-propeller or anchor of the largest steamship down to the tiniest teaspoon, must be manufactured from it, or its alloy or bronze.

The chief value of aluminum, at present, is in tempering or giving strength and a surface or body to alloys, bronzes or metals, so that they will not corrode. To copper, tin or zinc it gives such properties as can be obtained by no other means, softening their nature while increasing their real hardness and strength, and enabling them to resist all the tests applied to gold or silver, preserving them from corrosion and rendering them more ductile and refined, and giving them a surface and body that withstands the chemical action of the elements. As a result of this new process of making aluminum, all plated goods, nickel or silver, watch cases, cups, saucers, spoons, knives, forks, gun and pistol barrels, pistol handles, gun, harness, carriage and saddle ornaments made of brass, nickel, German silver, bronze or silver, must give way to those made of aluminum or bismuth bronze. Pianoforte wires made from it will vibrate ten seconds longer than the best now in use. The tensile strength of aluminum or bismuth bronze being the same, only in the latter 1-1800th part of bismuth is added, had been proved, by repeated tests, to bear a strain of forty-two tons to the square inch, or fourteen tons more than gun metal, and twelve tons more than the best Bessemer steel. Whenever and wherever there is need of a metal, and one is demanded that cannot crystallise or corrode under any circumstances, a metal that combines great strength and flexibility, it is plain that aluminum must be used. In the tests already made with propeller screws, blades, journal bearings and heavy artillery made from aluminum or bismuth bronze, as against those made from the best gun metal, the ship builders decided in favour of the former as the strength was so much greater and the weight so much less, being only one-fourth as great."

Selected Matter.

A STRANGE STORY.

"A more serious matter than that occurred to me," said a little man seated near the fire, and whose head was bald and his whiskers grey, though he was scarcely middle-aged.

It was in the snug commercial room of the "Seraph," at the little town of Evergiveany, on the borders of Wales, one November evening, about ten years ago. We were six in number. In the easy chair reclined little Larkey ; on the sofa sprawled Larkey's son, a big fellow six feet high, who had been a mate in the merchant service, and, tired of the sea life, had lately taken to helping his short parent on the road. Bould, in the tea trade, generally talkative and given to punning, was unusually silent, and sat quietly smoking, in which occupation we were all engaged except one, who appeared too fidgety to do anything in particular. This man, Baldwin, after displaying symptoms of restlessness for about half an hour, rang the bell for "Boots." On that functionary appearing, Baldwin said to him, "Has my portmanteau arrived?" "Can't come yet, sir," replied Boots ; "train not due for another twenty minutes. Let you know then, sir," and exit. Baldwin explained that, on changing trains at the Pwllypant Junction, he had left his portmanteau in the carriage for Drakesa, and he feared it might have been stolen, and should such prove to be the case the matter would be unpleasant, as there were fifty pounds of hard cash in that portmanteau. He had, however, wired to the junction, and hoped to see his property by the next train. This was what elicited the remark from the small man with the bald head, who, till that moment, had not uttered a word since he had lighted his pipe for the evening.

We all turned towards our new friend, who, after a short pause, said: "It's rather a long story. Would you like to hear it ?"

Our replies may be readily imagined, and the bald-headed man, after a few preliminary puffs of his pipe, began his tale as follows :

"It's some years since, when I travel-

THE BEST

The Dueber 14 Karat Gold Filled Watch Case.

This new and elegant Watch Case was first introduced to the trade March 1st, 1884, is made under J. C. Dueber's U. S. Patents, No. 290869 and 290870, dated December 25th, 1883, and is constructed throughout from 14 Karat solid gold bars rolled down over composition metal, except pendant bow joints, joint plugs and thumb pieces, which are solid gold. Contains more gold than any other filled case, and is finished and engraved with that degree of excellence which gives "The Dueber Cases" a world-wide reputation for superiority over every other watch case made.

For Sale by all reliable jobbers in watches throughout the Dominion. Send for price list. Purchase a sample lot and you will in future keep no other in your stock.

THE DUEBER WATCH CASE MANUFACTURING COMPANY, CINCINNATI, U.S.A.

led for Lever, Garnett & Co., the great watchmakers and jewelers, that the affair I have alluded to occurred. I did not take patterns or stock of jewelry, but represented the watch branch of the concern only, and carried with me on my journeys a stock of watches worth considerably more than a thousand pounds. These watches were arranged on trays in an oblong mahogany box, securely bound with brass and fitted with patent locks, and the box was of a size to go conveniently under a railway seat. It was my duty not to lose sight of this box when on the rail, and when at an hotel I always had it sent into my bedroom at night. On one occasion I was going to Ireland, and had taken the night express from Stafford, booking to Dublin, via Holyhead. I saw my box deposited under the seat of a second-class carriage, and had the compartment to myself till the train arrived at Chester. There another passenger entered, and seated himself in the further corner, on the opposite side to me. For a while I took no particular notice of the new-comer, but indulged in reverie while smoking this merschaum. [It was not so highly colored then as it is now, he added, parenthetically.] After some time I looked at my companion, and wondered who or what he could be. He was of angular and rather powerful build, and, being in ill-fitting, seedy black clothes, with a dirty white necktie and a shabby box hat, he had somewhat the appearance of a backsliding preacher or dissipated undertaker. But there were two little matters connected with this gentleman which I could not quite reconcile with either of these hypotheses. The first was, that, although his hair was rough and short behind, he had a long greasy lock twisted forward from each ear ; the other, that out of a bundle he had with him protruded the dirty ends of a pair of corduroy trousers.

"Being tired, I soon gave up thinking about the man, as I could make nothing of him, and went to sleep. I was awakened by the train stopping at the Holyhead station. My late travelling companion had departed, and as I knew that every compartment would be searched and all the luggage taken down to the Dublin steamer, I left my box under the seat, went to the refreshment rooms for a short time, after which I walked down the rails to the pier and on board the boat. There was the usual scene of confusion attendant on the departure of a Channel steamer at night—passengers wandering about, sailors bawling, hauling and calling, steam blowing off, and so on. The baggage had been deposited promiscuously on the deck, and some men with lanterns were engaged in sorting the packages and preparing to lower the larger ones into the hold. I did not see my box, but at first was not uneasy about it, believing it to be hidden somewhere among the rest ; till, as one package after another was shifted and it did not appear, some misgivings came over me. I asked the men as unconcernedly as I could if they had seen a box of the description I gave ; they had not, and then I became alarmed for its safety. My next step was to speak to the mate, who, on hearing of the valuable contents of the box, took a lantern and helped me in my search. We looked in every likely and unlikely place, but with no success. By this time the vessel was steaming along on her way to Dublin, and the captain had descended from the bridge that the mate might take his place as usual. On learning what was the matter the captain asked if there were any other passengers in the compartment in which I had travelled from Stafford. I then thought of, and described, the man who had got in at Chester. Thinking he had probably stolen the box, and was on board the boat, we looked about for him. He was not among the cabin passengers, and I accepted the captain's invitation to go 'for'ard,' where we scrutinized those in the forecabin ; but with no result, except that of making them wonder what on earth—or, rather, water—we were looking at.

"'I'm afraid it's a bad job, sir,' said the captain ; 'but your only chance is to make yourself comfortable and go back by the return boat to Holyhead, where you will be able to make enquiries about your box of the station master. You'll be there in the morning, and I wish you success. I'm just going to have a glass of grog, and then I shall turn in.'

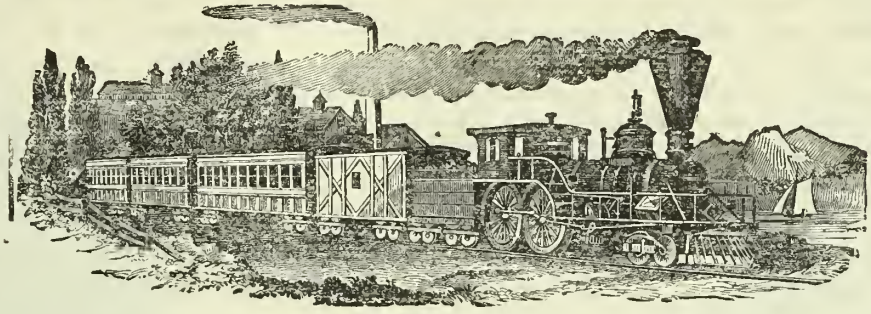
"Making myself comfortable was out of the question ; but I did return by the next boat. I met with every attention I could wish for from the officials at the Holyhead station. Every nook and corner was searched ; porters, engine cleaners, and all were had up and examined by the station master ; but with no result."

Here the speaker paused to refill his pipe.

"Ah !" said Baldwin, "of course you never heard more of the box or its contents."

"Hold on," said Larkey, junior ; "the yarn's not finished yet !"

"The rest may appear improbable," resumed he of the bald head ; "but is true, I assure you.



"As you may imagine, I was nearly distracted by anxiety and want of rest ; but it was of no use to wait about at Holyhead, so I determined on going up by the next train. The question was, where to go ? I could not bear the thought of presenting myself before my employers *minus* their property, which had been entrusted to me, without making some further effort. As it appeared utterly hopeless to recover the box and its contents, I took a ticket to Chester, having some vague notion that, as the suspected party had entered the carriage at Chester, I might find him there."

"Not likely," said Larkey, senior.

"You are quite right, but in these cases one catches at a straw.

"I had settled myself in an empty compartment, when, just as the train was moving off, a man got in, and, after taking off his hat, pulled out of his pocket a newspaper, and appeared to read. He was an ordinary-looking individual—might have been taken for a farmer, or, perhaps, a well-to-do tradesman. After scrutinizing him attentively for some time, I moved towards him, and said, 'Excuse me, you are a policeman, are you not ?' The man looked up from his paper, and gave me a searching glance, and said, quietly, 'Well, suppose I am ?' I told him about my loss. He appeared to pay very little attention to what I was saying, keeping the newspaper in his hand, and looking at it from time to time, except when I described the man who got in at Chester, about whom he questioned me rather closely. When I had finished he said, 'I *am* a detective ; but how do you know it ?' 'By your boots,' said I. 'You have the regulation police boots.' My new acquaintance said there was little chance of my ever seeing the watches again, though he would do what he could for me if I would strictly follow his instructions, which, of course, I was glad enough to do ; and they were as follows : 'At Chester there will be a delay of ten

minutes. Get a ticket for Stafford. Take no notice of me. If I brush past you, or even get into the same compartment as yourself, do not look at me. When you arrive at Stafford go to your hotel, say nothing about your loss to anyone till you see me. I shall be with you about four o'clock.' I went to Stafford, settled myself in the coffee-room of the hotel, and, though the people about wondered at my return, I kept my own counsel. I ordered dinner, as a matter of course, but nothing could I eat.

"Four o'clock came; five; six. My travelling friend did not appear. Could I be hoaxed? You may imagine the state of my mind and nervous system—describe them I cannot. Towards seven o'clock he walked in, as he said, 'just to show himself.' Could give me no hope. 'Keep yourself quiet,' said he; 'I'll see you again at nine,' and went away. 'Nine!' said I to myself, 'that will be ten or later.' However, at half-past eight in came the detective, and said, 'Come out quietly with me.' I went with him to the police station, where I was introduced to the superintendent, and shown into a dimly lighted room. The superintendent, pointing to something in the corner, said, 'Is that your box?' Yes; there it was. At first I was ready to dance for joy; but, in a moment, I thought, here is the box, but how about the contents? Where are the watches? The box was opened—every watch was there—but not only were the trays sadly battered about, nearly every watch-glass was broken, and the watches arranged—or, rather, disarranged—in a most remarkable manner. The first thing I did was to select a twenty guinea watch, and present it to the detective; my next to invite him and the superintendent to supper. The superintendent declined, but the detective came, and we kept it up rather late. I was not a very early riser on the following morning.

"'Well,' said I, 'how did it all come about?'

"'In this way. The detective and an assistant were on the track of two men suspected of robbing and attempting to murder a farmer in Yorkshire on his return from market. They had tracked the thieves to Holyhead, and then lost scent. My affair, through the fortunate circumstance of the detective getting into the same compartment as myself, put them on the right track, and hence the result. They were caught at Stafford. A struggle ensued, which accounted for the breakage of the watch glasses; and the fellows were tried and convicted subsequently for the other offence."

"How about Lever and Garnet?" said Bould.

"I went up the next day and reported the matter faithfully."

"Well?"

"They discharged me."

"Served you right," said Larkey, senior.

"Hard lines—very!" observed Baldwin in a sympathetic tone.

"But they reinstated me the next day, saying they hoped the affair would be a warning to me to be more careful in future."

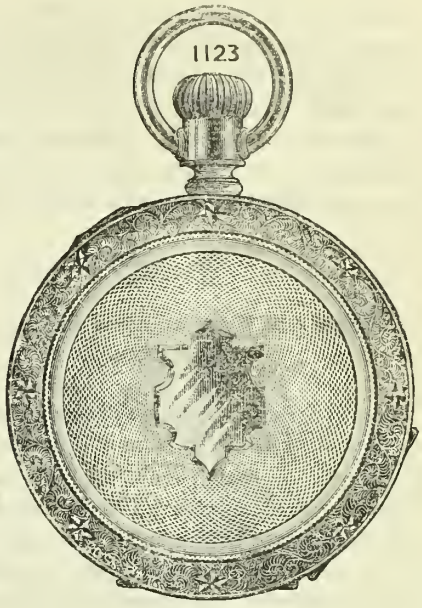
Here the door opened, and the Boots of the "Seraph" put in his head. "Mr. Baldwin, your portmanteau's come, sir, and quite safe." "That's a relief," said Baldwin. "Ring the waiter's bell."—*J. R.*, in *On the Road.*

ARTIFICIAL DIAMONDS.

New York *Post*:—While the attempts of chemists to manufacture genuine diamonds have always ended in failure (except, perhaps, in the production of carbon atoms too minute to have any commercial value), the many efforts to imitate the diamond have resulted in considerable success, and all previous imitations have been surpassed through a process lately introduced in France. Large quantities of the artificial gems thus made have recently been imported into this country, where they are sold in the trade under the name of "heliolas," a diminutive of the Greek word *helios*, the sun. They are manufactured from the colourless glass known as strass, which has long been extensively used as a basis for artificial jewels, but which in this case is subjected to a new treatment. After the application of great heat, this substance is plunged into cold water, and the consequent sudden chilling has a powerful contracting influence, so that the grain of the strass becomes exceedingly close and fine. Hence the glass is made very clear and transparent, and given a remarkably hard surface, which is susceptible of a high polish. Then it is cut and polished like a real diamond, the cutter using a leaden wheel, with oil and diamond dust; but, while the genuine stones are always cut singly, a number of the heliolas are fastened with wax in a row upon a stick and are all cut at the same time. For the original foil backing to give brilliancy to an artificial gem, a very small bit of foil is substituted, which is attached to the cutlet, or centre of the back. In this way the transparency of the stone is preserved, while the light is reflected into its heart.

When first made in Paris, about two years ago the heliolas were produced in comparatively small numbers, and, being sold by but few establishments, were introduced at first among the better class of people, for whom they were set in silver combs, tiaras, and other ornaments for the hair. Their brilliancy and close resemblance to genuine diamonds gradually caused a large demand for them, and the Paris trade in them became extensive about a year ago. Their importation to this country began some seven or eight months since, and is, rather singularly, controlled by a Maiden Lane firm of dealers in genuine diamonds. They are used for a variety of purposes. Besides being suited for stage jewels, they are largely taking the place of Rhine stones, in back combs, and they are set in rolled plate or low-carat gold for jewellery of every form. To a much greater extent than the uninitiated would imagine, they are worn by ladies who are the owners of real diamonds, but who have temporarily parted with the possession of their gems. When a speculator in Wall-street or elsewhere "comes to grief" of a serious character, it is not infrequently found advisable to pawn his wife's diamonds if they represent a considerable capital It is also considered advisable that their absence should not be remarked, and as temporary substitutes the heliolas are found very convenient and deceptive.

A jeweler of this city succeeded last season in greatly astonishing the guests of a summer hotel, where he was staying with his wife and several daughters. A ball being given at the resort, he borrowed from friends in the trade a large quantity of heliola jewelry, and the female members of the family appeared at the entertainment in such a blaze of gems that the admiration and envy excited were surpassed by the general amazement.



The heliolas are cut in both brilliant and rose forms, and are of all sizes, shapes, and colours. Generally they are pure white. The unset stones are graded in certain sizes, to conform to the caret sizes of genuine diamonds, and are sold, according to size, at from $20 to $50 per

gross. When set and worn, their resemblance to the real gems is such that they are likely to be mistaken for them by all but experts. The latter, however, cannot be deceived, as there is a peculiar light in the flash of the true diamond which even this imitation does not reproduce.

GERMAN WATCH AND CLOCK MAKERS.

The old church at Lubeck is considered to contain one of the most ingenious specimens of early clockwork that has been preserved. It represents the changes of the heavenly bodies until the year of 1875, and when it strikes twelve, a number of automaton figures are set in motion; the electors of Germany enter from a small side door, and perform the ceremony of inaugurating the Emperor, who is seated upon a throne in front. Another door is opened, and Christ appears, when, after receiving His benediction, the whole cavalcade disappears midst a flourish of trumpets by a choir of angels. On each side are bas-reliefs illustrative of passages in the life of our Saviour. In that of the Last Supper a mouse is seen peeping from beneath the white table cloth, and this animal represents the armorial bearings of the once puissant city of Lubeck.

The English and the Augsburgians became famous for their clocks and watches, and made many of the latter, as well as clocks, which showed the hours, phases of the moon, and the days of the month. At Augsburg were also constructed most of the clocks and watches with moving figures, such as a moon, a monkey blowing a trumpet, and similar toys moved by clockwork concealed within them. These toys were chiefly made and used for presents from the ambassadors of Christian countries to Oriental princes and barbarians. It is stated that a miniature silver army of cavalry and infantry was made at Nuremberg which moved their limbs, went through their exercises and fired, by clockwork within them. In the cities of Augsburg, Nuremburg and Ulm, clock and watchmakers were obliged to observe certain ordinances; and also, as a proof of their skill and ability for a masterpiece, to make a horizontal square or hexagonal table clock; masters' sons were free to choose which, and eight months' time was given them to complete the work. The artists of Augsburg and Nuremberg used to take their clocks and watches in great numbers to the fair at Leipzig, and thus they were spread abroad over Europe. Nicholas Rugendas was a celebrated clock-maker of Augsburg in the fifteenth century.—*Ext. of Correspond.*

Jean Mouchel was the proprietor, in 1819, of an estate in Normandy that had been in the possession of his family since 1715. A foundry was on the estate, and he was fortunate enough to discover the secret of an alloy that produced the finest brass yet known, which is still prized in the market, and called Mouchel brass after its inventor. The foundry and estate have descended to J. O. Mouchel, whose exhibit of brass at the Paris Electric Exposition did honor to his family name. One coil of copper wire was shown that only weighed four kilogrammes, and yet it was 60,000 meters in length. A German silver wire was also exhibited one millimeter in diameter and 10,000 meters in length. The Mouchel establishment furnishes platinum wire, when desired, only a fraction of a millimeter in diameter—a difficult job—besides every variety of metal in every conceivable shape.

The Besancon Chamber of Commerce in its annual report states that the total number of watches made in that town last year was only just short of 500,000, or nearly 50,000 more than in 1881, when the total was 448,680, the average for the preceding five years having been 440,000. The proportion of gold to silver watches throughout this period has been about one of the former of two of the latter, and taking the average value of the gold watches at £3 8s., and that of the silver watches at £1, the Chamber of Commerce estimates the total value of the goods manufactured last year as a trifle over £900,000. The number of watches imported from abroad is diminishing every year. In 1881 there were imported 32,156 gold and 60,554 silver watches, but last year the total had fallen to 28,218 gold and 48,704 silver watches, and nearly all of these came from Switzerland. In other words the total number of watches sold in France last year was 568,722, of which 86 per cent. was made at Besancon.

A VALUABLE CLOCK.

Some time ago a well-known native of Bombay offered to give a new clock and chimes to the University of Bombay, and deposited a large sum of money with the authorities to carry out his generous intention. The gift has been manufactured in London and is about to be shipped to Bombay. Doubtless it is such a timepiece as India never saw. The dials, of opal glass, are thirteen feet in diameter; it is fitted with an apparatus enabling it to telegraph its time daily to the observatory and to correct all the other clocks in the city, and connected with it is a chime of sixteen bells which can play automatically, sixteen tunes and 150 changes.

A NOVEL EXHIBITION.

A steamboat of 3,000 tons, named the "Viceroy," has been been equipped in London, for carrying a portable exposition, and is to receive a large variety of English exhibits. It will make the tour of the world, and stop in the principal ports of the different countries. The aim of this entirely novel enterprise is to bring before the eyes of foreign buyers the specialties of the manufactories of London, Birmingham, Manchester and other great centres of industry, and thus save to foreigners the trouble of a voyage to England. The cabins and all available space will be transformed into exhibition rooms.

Herr Charles Reuge, watchmaker, of St. Croix, has invented a pocket watch which is a master-piece of art. It shows hours, minutes and seconds, and contains miniature musical works with two tunes. It plays only every hour, but by pressing a little spring it can be made to play at will.

BUSINESS CHANGES FOR APRIL.

W. Sanderson, jeweler, Peterboro, Ont., stock damaged by fire; "Derby Silver Co.," Toronto, Ont., have closed their Canadian branch factory; John A. Moore, crockery, Winnipeg, Man., assigned in trust; Arthur Chown, hardware, Kingston, Ont., admitted A. F. & O. Chown as partners, style now A. Chown & Sons; Thompson Bros. & Forest, jewelers, Winnipeg, Man., dissolved, C. F. Forest continues alone; Pollock & Co., jewelers, Winnipeg, Man., stock in possession of the Customs authorities; John M. Campbell, hardware, Drummondville, Ont., sold out; G. M. Welton, hardware, Mount Forest, Ont., sold out to H. R. Welton.

BUSINESS NOTES.

Mr. Samuel Stern, the well known wholesale merchant and "clock king" of Canada, sailed for Europe on the 10th of last month, to purchase goods for his fall trade. We wish him a prosperous trip.

Michael Cronin, a watch-case manufacturer of Germantown, Pa., was arrested yesterday on a charge of obtaining $17,000 worth of gold bullion under false pretences from a firm in New York city.

Mr. Charles Segsworth, of the firm of John Segsworth & Co., Toronto, sailed for England *via* New York last week. The Trader wishes him a prosperous voyage, a pleasant trip, and a safe return.

Geo. A. Neveux's hardware store, Windsor, was entered by burglars on the morning of April 1st. The showcase, containing $75 worth of cutlery, was relieved of its contents, and between $5 and $10 were taken from the till.

The Waltham Watch Company, having got down to hard pan prices first, have been the first to reap the advantage of the change. They report trade good and demand for both home and export increasing.

John Segsworth & Co., the well-known wholesale jewelers, of Toronto, have purchased the warehouse next door to the Bank of British North America, on Wellington street east, where they propose eventually to remove. Wellington street should now be dubbed the Maiden Lane of Toronto.

S. T. Culp, jeweler, of Toronto, has not discovered perpetual motion, but he claims to have a machine that works on a two per cent. margin. Mr. Culp's invention is well adapted for revolving platforms in show windows and in this line at least there should be a fortune in it for him.

The Lancaster Watch Company after a good many relapses has finally ceased to exist. They had a good thing but did not know how to handle it, and its demise may be put down like lots of other failures, to incompetence and bad management.

The Customs authorities have seized the stock of Messrs Pollock & Co., jewelers, of Winnipeg, Man. The firm are charged by the department with smuggling goods, and a searching investigation of their affairs has been ordered. We have no doubt that the firm will be able to shew a clean record and free themselves from any taint of evading the law.

Says the Halifax *Recorder*:—A man giving his name and address—Thomas A. Gough, 90 Kempt road—writes to the *Recorder* saying: I have a clock that always has kept excellent till the "standard" came in vogue. On the day of the change I altered the clock to the new time. To my surprise it returned within ten minutes to the regular time. I have tried setting it to standard time on a dozen occasions, but always with the same result. I am willing to let anyone try it on this clock, as I am convinced it will not keep the standard time. Is this clock more intelligent than our wiseacres?

Two men were recently arrested in Windsor on suspicion of having attempted a burglary at Hall's jewelry store. The door was found forced nearly off its hinges. The burglars were frightened away and subsequently arrested. They claimed to be brothers, and gave the names of Edward and William Steentons. They were discovered hiding behind the building. After a struggle they were arrested by two officers. During the struggle one of them attempted to use a revolver, but was knocked down. They were taken to Sandwich, and will be held at the Assizes on a charge of attempted burglary.

Larceny from an Express Company.—About two weeks ago the officials of the American Express Company found that a gold and silver watch had been stolen from their office at the Union depot. The police were notified, and Detectives Hodgins and Burrows were detailed to work up the case. On Thursday last they found one of the watches and yesterday they found the other, and arrested Samuel Smith, a clerk in the employ of the company, on the charge of stealing the watches, and Thomas Naismith for receiving them, known them to have been stolen.

Medals.—At a meeting of the executive of the Toronto Industrial Exhibition Association, held on the 22nd inst., Messrs. P. W. Ellis & Co., of this city, were awarded the contract for making their gold, silver and bronze medals. This is highly gratifying, seeing that heretofore they have always had to have them made in England. We understand the above firm are now making medals a special branch of their business, and have at considerable expense purchased machinery for that purpose.

Billy Lawlor and Mark R. Lazier were taken to Kingston last month by Detective Flynn of Hamilton and Jailer Butler of Simcoe. Lawlor goes down for 10 years and Lazier for 3½ years. Both men are accomplished crooks. Lawlor was convicted as the principal in the recent big jewelry robbery at Simcoe, but none of his confederates were convicted. He has been engaged in many robberies throughout Ontario, but the police were until now unable to get him a long sentence. Lawlor is a clever cracksman, but he is nearly broken down in health and spirits and it will be a wonder if he lives his sentence out. Lazier is an imported confidence man. He fleeced several varnish houses in the United States and Canada. C. O. Ollcott, of New York, chairman of a committee of the varnish trade in the United States, issued a circular offering rewards for Lazier's conviction. Lazier lately arrived in Canada and commenced operations. He struck Simcoe, succeeded in obtaining $100 from two varnish dealers in that town by false pretences, was convicted and went to Kingston for the term indicated.

The jewelry store of J. M. Proctor, 272 Yonge street, was the scene of a most complete burglary on the 9th of April last. Some time during the night thieves effected an entrance through a back window, and after securing all the doors, carried off the entire contents of the safe, except the cash-box, which was so securely fixed in the upper part of the safe as to defy removal. So quietly was this effected, that the first intimation of the robbery was when Mr. Proctor tried ineffectually to enter the store in the morning. The police authorities were immediately notified, and Detective Reburn has the case in charge. Mr. Proctor gives the following list of the articles which he kept in the safe and which have all been stolen:—14 silver watches, double case, value $150; 48 gold rings, $200; 40 pairs gold earrings, $50; one gold necklace, $20; four gold-plated chains, $16; fifteen gold sleeve buttons, $50; 8 gold lockets, $60; 4 Lancaster watch movements, $24; 4 Elgin, Ill., do., $24; 2 Montauk, do., $6; a pair of gold bracelets, $60; total, $760. Mr. Proctor's stock-book and day-book, which were in the safe, were also stolen. So far none of the goods have been discovered.

"Hampden Watches" have ever had an enviable notoriety in the United States, where they have always commanded the very highest price in the market, and even then the demand has always exceeded the supply. The company has lately erected new buildings thereby more than doubling its productive capacity, and now proposes to keep pace with the demand for their goods whether for home trade or export. Their prices have also been reduced to keep pace with the times, and they now claim to furnish not only the best watch made in the United States, but the best value for the money. Mr. Rood, the general manager of the Hampden Company, is the right man in the right place, and while he is bound to keep his goods up to the highest standard of excellence attainable, he takes good care that they do not lag behind in the matter of price. Under such careful and energetic management we do not wonder that the company has achieved its present high standing and success or that it aspires to even greater things in the future.

We were pleased to receive a visit last week from Mr. Morrow, the general manager of the Illinois Watch Company, of Springfield, Ill., who visited Canada with a view to pushing the sale of the goods his company manufacture. The result of Mr. Morrow's visit has been a sweeping reduction in price in Illinois movements, and the planning of a vigorous missionary campaign amongst our retail jewelers. This reduction in price we predicted some time ago, and in making it the Illinois Company have shown themselves level headed business men, able and willing to discern the signs of the times.

WORKSHOP NOTES.

Old leather articles, such as leather bags, can be restored to their pristine freshness by an application of good blacking, a subsequent brushing, a very slight oiling, and an after dressing of gum tragacanth.

High chimneys for factories are now becoming unnecessary, by reason of the introduction of a new kind of oven. Any manufacturer, it is asserted, can place one of these ovens in his works, and obtain from every ton of slack he uses coke worth $2, tar and ammonia worth $1, and 14,000 feet of gas to generate steam. The coke, tar and ammonia will thus, it is claimed, considerably more than pay for slack, wear and tear, etc.

A small piece of resin dipped in the water which is placed in a vessel on a stove, says one who knows, will add a peculiar property to the

this Trade Mark is stamped on all Knives, Forks, Spoons and other flat ware of our manufacture.

The A 1 Goods are Standard Heavy Plate, and XII signifies that in addition the articles have an extra quantity of Silver on all the parts most exposed to wear.

The Meriden Britannia Company have been awarded the highest premiums wherever exhibited, from the WORLD'S FAIR, 1863, to the PRESENT TIME, and the high reputation of our Goods throughout the world has induced other makers to imitate our Trade Marks and name as well as our designs, and as many of our patrons have, through a similarity of names, purchased inferior goods under the impression that they were our manufacture, we are compelled to ask especial attention to our Trade Marks.

THE FACT THAT OUR NAME AND TRADE MARKS ARE BEING SO CLOSELY IMITATED SHOULD BE A SUFFICIENT GUARANTEE TO THE PUBLIC THAT OUR WARES ARE THE BEST IN THE WORLD.

WE RE-PLATE OLD WORK AND MAKE IT EQUAL TO NEW.

atmosphere of the room, which will give great relief to persons troubled with a cough. The heat of the water is sufficient to throw off the aroma of the resin, and gives the same relief that is afforded by a combustion of the resin. It is preferable to combustion, because the evaporation is more durable. The same resin may be used for weeks.

CINDERS IN THE EYE.—An exchange has the following; "A very simple and effective cure for cinders in the eye is within the reach of every one, and would prevent much suffering and expense were it generally known. It is simply one or two grains of flaxseed. These may be placed in the eye without injury or pain to that delicate organ, and shortly they begin to swell and dissolve a glutinous substance that covers the ball of the eye, enveloping any foreign substance that may be in it. The irritation of cutting the membrane is thus prevented, and the annoyance may soon be washed out. A dozen of these stowed away in the vest pocket may prove in an emergency worth their number in gold."

When an Armenian wishes to embellish a watchcase, he gets the precious stone set in gold or silver, with the lower part of the metal made flat or to correspond with that part to which it is to be fixed; it is then warmed gently and some glue applied, and the parts thus cemented never separate. This cement is thus made: Dissolve five or six bits of gum-mastic, each the size of a large pea, in as much alcohol as will suffice to render it liquid; in another vessel dissolve as much isinglass—previously a little softened in water, though none of this water may be used—in good brandy as will make a two-ounce phial of very strong glue, adding two small bits of gum-galbanum or ammoniacum, which must be ground until they are dissolved; then mix the whole with sufficient heat. Keep the glue in a phial closely stopped, and when it is to be used set the phial in boiling water. To avoid cracking the phial by exposure to such sudden heat, use a thin green glass phial, and hold it to the steam for a few seconds before immersing it in the hot water.

OTHER NOTES.

SINCE the barbed wire first made its appearance over 500 patents have been issued in the United States for the various improvements and alterations which have been made in its construction. There is more than $5,000,000 invested in real estate and machinery for its production, and it requires a working capital of $15,000,000 per annum to carry on its manufacture.

THE newest style of cheap advertising in London, that hotbed for such things, is this: A child of nine begins to cry terribly at the corner of a street till the crowd grows larger and larger. Nothing will he say till it becomes larger still, when at last he calls out quite loud so that all may hear that they may take him home to "19 Avenue road, at Smith, the boot-maker's, who has recently received a fresh importation of kid shoes from Paris."

DR. GIBBONS, in the *Pacific Medical and Surgical Journal*, cites a case of hypochondria in which a farmer imagined his nose to be a bundle of hay. He took great care not to go near a horse or cow lest his hay nose should be destroyed. Men are more likely than women, says the doctor, to have hypochondria, though women have hysteria oftener than men. The diseases are closely allied in their origin and nature.

CHEMISTS have just completed a series of experiments with zirconia as the base of carbon points in electric lights. The present base is petrolem coke. Zirconia is practically indestructible. The experiments are said to have been highly successful, and it is expected that with this material points may be made which will last a year.

THE standard of the Mahdi, captured at Tokar, has been presented to the Queen. It is about two and a half yards long and two yards wide, and is composed of red and yellow silk. On one side is an Arabic inscription, stating that it was presented by the Mahdi to the Governor of Tokar, and on the other a text from the Koran: "There is no god but God, and Mahomet is his prophet; every one professes the knowledge of God."

THE cutting of a diamond, believed to be the largest ever cut in the States, has just been completed in Boston, the process having occupied about three months. The stone was found in South Africa, and was imported by a New York firm. Its weight in the rough was nearly one hundred and twenty-five carats. The gem as perfected is very brilliant and beautiful, though it is not perfect in color, a marked yellowish tinge prevailing. As cut it weighs 77 carats. It is cut in a rounded cushion shape, with 56 facets, its size being nearly a full inch across and a little more than five-eighth of an inch in depth. The yellowish tinge disappears in artificial light. The value of the stone, which is about two-thirds as large as the Kohinoor diamond, cannot be stated, as diamonds of unusual size have no absolute value.

HOW BOYS' MARBLES ARE MADE.—Almost all the "marbles" with which boys everywhere amuse themselves in season and out of season on pavement and in shady spots, are made at Oberstein, Germany. There are large agate quarries and mills in that neighborhood, and the refuse is turned to good account in providing the small stone balls for experts to "knuckle-down" with. The stone is broken into small cubes by blows of a light hammer. These small blocks of stones are thrown by the shovelful into the hopper of a small mill, formed of a bedstone, having its surface grooved with concentric furrows; above this is the "runner," which is of some hard wood having a level face on its lower surface. The upper block is made to revolve rapidly, water being delivered upon the grooves of the bedstone where the marbles are being rounded. It takes about fifteen minutes to finish a bushel of good marbles, ready for the boys' knuckles, One mill will turn out 160,000 marbles per week. The very hardest "crackers," as the boys call them, are made by a slower process, somewhat analogous, however, to the other.

Editorial.

THE OUTLOOK.

The recent returns furnished by the Ontario Bureau of Statistics of the crop reports for the Province of Ontario are very reassuring, and indicate a decided change for the better so far as this fall's trade is concerned. With very few exceptions this report goes to show that the crop of this Province is fully up to the average, and if nothing occurs between now and harvest to damage it, there will be a very decided revival in all branches of business. Trade of all kinds has been very dull for the past four or five months, and this depression must mainly be ascribed to the short crop of last year. Canada, like every other new country having few or no manufactures, depends mainly for her prosperity upon her agricultural products. Last year our crop was about twenty-five million dollars short of the average, which simply means that our national purchasing power has to be curtailed by that amount; hence our present depression.

In addition to the prospect of a good crop, a very reassuring thing is the immense falling off of our imports of manufactured goods. We are informed upon good authority that the shrinkage on our imports of dry goods during the past month alone for the whole Dominion will aggregate fully one million dollars less than for the same month last year. This is a hopeful sign as well as a healthy one. If our importers only buy for the real wants of the country there will be less revenue, it is true, but less slaughtering of goods, more careful credits and a very much healthier commercial pulse, than when with immense over-importations our wholesale men are forced to sacrifice goods on any terms in order to raise paper to meet their foreign obligations.

So far in spite of the recent developments on Wall Street, money is plentiful and only waits legitimate channels in order to put it into circulation. The financial crashes of Wall Street are simply indications that in the game that the stock gamblers there have been playing, some of them have come out second best, that is all. As far as legitimate trade is concerned it is just as sound financially as it was before the burst, and will only be indirectly affected by it. If people will gamble, and it don't matter a particle whether they gamble with stocks or cards, it is bound to end disastrously for some of them. If they lose they are not deserving of sympathy.

On the whole we think that the business outlook is good. The commercial barometer at present indicates fair weather and has an upward tendency. Canada is in a position to stand a prosperous harvest this year as well as she ever could, and if it should providentially turn out as well as it now indicates, our citizens, whether merchants, agriculturists or mechanics, will be greatly benefitted by it.

THE PROPOSED JEWELERS' LEAGUE.

We learn from several sources that it is proposed to organize a "Jewelers' League" in Ontario, apparently as a panacea for the present depression in the jewelry business, and any others that it may fall heir to in the future. Before entering into the subject of this proposed League, we may say very briefly, that although we are opposed to this League as now proposed, we are thoroughly in accord with the idea of a Jewelers' League if properly organized and managed. In an editorial article in our issue of January, 1882, after pointing out the advantages of such an organization, we said: "It is for the Retail Jewelers of this Province to determine whether such an association will be of any practical advantage to them in conducting their business. If, as many of the foremost amongst them say, it would be, then the more quickly they set about its organization the sooner they will enjoy its benefits. It seems to us that the time is now ripe for such a development, and it only wants a few well known men to put their shoulders to the wheel, to make the project go." Although we offered space in our columns to ventilate the scheme, nothing came of it, which proves conclusively to our minds that the time was not fully ripe for the organization of such a League. Whether the time is any more propitious now we very much doubt, as so far there seems to have been no indications put forth upon the subject from disinterested parties whose expressions of opinion would carry some weight with them.

So far as this proposed League is concerned we object to it for two reasons: *first*, because its aims are illogical and not practical enough to be successful; and *second*, because we have no faith in its promoters.

As regards its aims, from what we can learn they are thoroughly Utopian, and in this common sense dollar and cent age, could never be enforced. What these aims are exactly we do not know, probably neither does its projector, but the following extract from one of his letters may serve to throw some little light upon this rather hazy question:

From those who have answered so far I find that all are suffering from some source. I trust the day is not far distant when we shall be able to remedy many things, get incorporated, prevent those who are not watchmakers from calling themselves such or dealing in time-pieces without the sanction of the Union.

With some of the above we thoroughly agree. We know for a fact that many, in fact nearly all our Canadian jewelers, are suffering from some source. This source, however, is we think an ordinary business depression caused by the poor crop of last year. The jewelry trade, being one which deals principally in luxuries, is from its very nature the first to feel the effects of such depression and the last to recover from it. The jewelers of the United States who have enjoyed

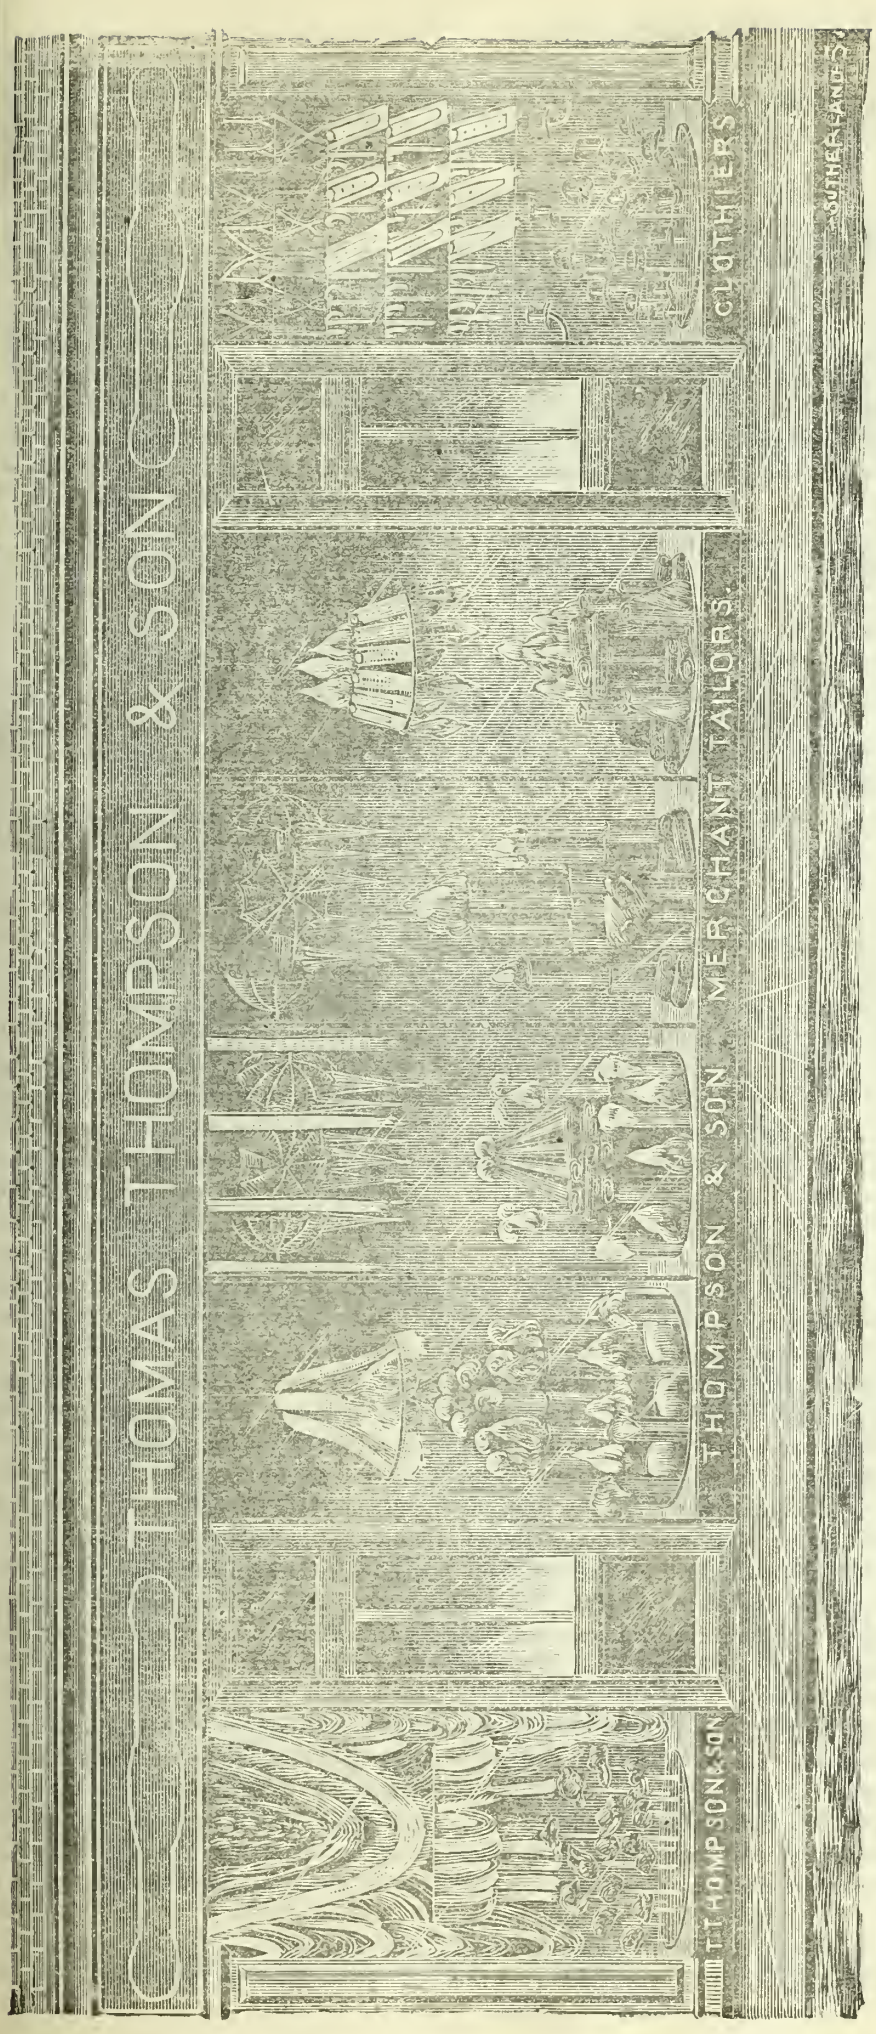
all the protection and advantages that can possibly be derived from a League are similarly depressed, so we may naturally infer that this new panacea is not an infallible remedy for all the ills of the jewelry trade. The fact is that most business troubles arise from violations of ordinary business laws; too many in the business, ignorance of the trade and want of proper management, extravagance in buying and in giving credit, these and kindred abuses are what are really eating the life out of the jewelry business in Canada. This being the case it follows that no amount of legislation that could be secured nowadays would remedy the existing state of things with some people. If the promoter of this League can get Parliament to legislate brains into people's heads, give them a thorough knowledge of the trade, furnish them with capital adequate to their wants, and force them to do business only upon business principles, then and then only will the jewelry millenium have arrived for a certain class of jewelers who are always in hot water under our present matter of fact conditions.

The proposition to allow such a League to license only those who pass an examination by its board is about as rich a thing as any man outside of an asylum ever proposed. Who would compose the board of examiners, what should their qualifications be, by whom should they be appointed, what would be the nature of these examinations, theoretical or mechanical or both? These and fifty other questions stare one in the face at the first blush, and no doubt as many more and equally hard to settle would crop up before such a board could ever be got at work. In the meantime, what would be done with the jewelers who are not practical mechanics, but only possessed of the commonplace qualifications of having capital and brains enough to run a business successfully. Should they be kicked out of the trade neck and crop, or would the proposed Jewelers' Guild be pleased to grant them a special dispensation which would enable them to carry on their trade? No doubt these gentlemen, and their name in Canada is legion, for they are many, will find their heart in their throat when they hear of this proposed move, and the chance that, like Othello, their occupation of which they have all along been honorable exponents may soon be a thing of the past.

This proposition to place watchmakers and jewelers upon exactly the same platform as doctors and druggists is absurd in the utmost degree. The Medical and Pharmaceutical Associations are empowered by statute to enforce rigid examinations in order to protect the public against the blunders of quacks or incompetent persons in matters where an error may be fatal to the life of the person employing them. In both cases it is protection for the public that is sought for, and not protection for the doctors and druggists. As far as the public and the jewelry trade are concerned the former require no protection whatever. Even if a jeweler is dishonest and sells 10 karat gold for 18 karat, takes wheels out of watches, as they are said to do when repairing them, so that they never go properly afterward, or even if he commits all the crimes in the jewelers' decalogue, what is the consequence? Simply that a customer once cheated is not likely to be caught again by the same person, and as a result the dishonest jeweler soon finds himself without any customers to operate upon. He may lighten their pockets once, but he rarely gets a second chance to do so, and in any event he does himself more harm than them. If jewelers get legislation of this kind then grocers will soon be wanting a similar act to cure their business ills; then the tailor and shoemaker will follow suit, and no one can predict where the end will be. These are some of the reasons why we object to the aims of this proposed League.

We object to this new departure in the second place because we have no faith in its promoter. We do not know exactly who its promoters are, or whether it has more than one. So far as we can learn Mr. R. Knox, of Mount Forest, is at present the sole proprietor of this wonderful patent nostrum that is going to "remedy many things" in the jewelry business. Now we do not wish to say one hard or unkind word about either Mr. Knox or his ability to run such an institution, but we may be permitted to state our deliberate conviction that Mr. Knox is not a suitable person to inaugurate such an enterprise. The originator of such a League should at least be a person of some standing in the trade, one whose business record is without blemish and who not only possesses brains enough to run such an organization, but also the confidence of the majority of the trade.

In our opinion, and we say it with all respect for the gentleman in question, Mr. R. Knox does not come up to this standard, and is not a proper person either to inaugurate such an enterprise or carry it on to a successful issue. We understand that Mr. Knox is asking those favorable to his scheme to send him $3.00 each in order to pay the preliminary expenses of printing and postage, from which it would seem that his new League are going to deal largely in printer's ink. Our advice to these gentlemen is to keep their money in their own pockets until a common sense League is formed with men at the head of it in whom they have entire confidence.



In our next issue we may have something more to say about what a jewelers' League should try to accomplish for our Canadian trade. At present we leave this matter in its present shape in the confident hope that the trade of this Province will not allow themselves to be led away on some wild goose chase after impossible and nonsensical legislation. If, however, we have misjudged Mr. Knox and his League, we shall be glad to be set right, and promise to give his version an equal publicity with our own views on this subject.

Correspondence.

To the Editor of THE TRADER.

Dear Sir,—It appears the watchmakers are beginning to awake to the necessity of forming a union. All other trades have their unions. Watchmakers seem to be the only trade without one, and there is no trade in Canada that has more need of one, as it will have a tendency to help both the boss and the journeyman. If, as I suggested in my letter in your December number, an Act could be got compelling all who deal in clocks or watches to pay a license, and those who undertake to repair pass an examination as to their proficiency, it would be a means of protecting the owners of watches as well as the trade.

It does seem strange that the trade have not been more alive to their own interests, as in your number of last August appears a letter from a Hamilton jeweler, which you endorse in your editorial of the same date. I made bold to address you in your issue of December, which you kindly inserted, and have been waiting to see correspondence from others of the craft, but none appear to trouble themselves to write, although

TO THE PUBLIC.

Thanking those who have bought my PATENT MOTOR for the many words of encouragement both verbally and by letters, I have printed below a letter signed by Thos. Thompson & Son, Toronto, and show wood cut of their immense establishment.

To any who may want Motors, I have to say that we only sell to one establishment of a kind in a block, and in a town of less than two thousand inhabitants on the same terms. Price, $10 per foot in diameter, that price of motor is to be wound up once a day, three seconds of time in twenty-four hours keeps from twenty-five to six hundred pounds moving at rate required by the owner, as it is entirely regulated by the weight. Two pounds weight will move one hundred pounds nicely, if required to move faster put on more weight. Mention THE TRADER in your letter.

Hoping to hear from you.

I remain, yours truly,

S. T. CULP.

Toronto, May 26, 1884.

S. T. CULP, ESQ.,

Toronto.

Dear Sir,

We take much pleasure in stating that the Motors with which you supplied us are giving every satisfaction.

When nicely trimmed with goods the window display is most attractive. And as they are so easily managed, we find it to be no trouble to take them out of the window when we wish and replace them again—thus continually making a change.

Yours truly,

(Signed) THOS. THOMPSON & SON.

there is a move made. I received a price list of trade work from a gentleman named Knox; in it he asks the question: "Are you in favor of union?"

My reply was in the affirmative. He sent me a post card, stating that the sum of three dollars was required to enrol my name as a member—a sum, in my opinion, which every one in the trade should contribute in order to bring about the needed reforms.

In our village even the dry goods men are selling jewelry, and no men squeal more if they think we buy our dry goods in Toronto.

Hoping you will excuse my troubling you, I remain,

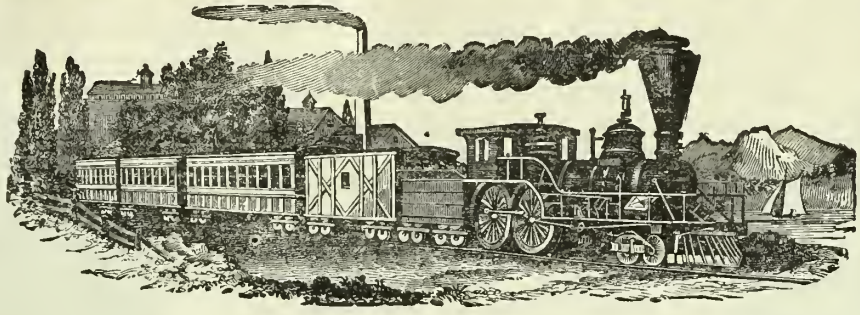
Yours truly,

THE MAN WITH A GRIEVANCE.

May 20, 1884.

Selected Matter.

ARISTARCHIUS PLUMBAGO AND HIS BICYCLE WATCH COMPANY.



In my last communication to the *Jewelers' Circular*, injustice was done me through the instrumentality of the red-haired son of Erin whom I had employed in a menial capacity at my embryonic factory at Stoneville. I had commenced writing an account of the invasion and siege I was undergoing at the hands of the flop-over button brigade when I became mentally prostrated from their importunities and the large quantities of cod-liver oil I had consumed by way of stimulating my nervous energies. Three bottles of this invigorating beverage had I secured for my personal delectation, and to which I had frequent recourse during my interviews with the flop-over button men, and was finally in a most unaccountable manner reduced to a condition of insensibility. It subsequently transpired that the office boy used the cod-liver oil to grease his hair with, and had filled the empty bottles with a vile decoction of bad whiskey, and this I drank in my bewilderment with the result mentioned. To add to his infamous conduct, that office boy sent off my unfinished letter to *The Circular*, first adding a postcript stating that I had been conveyed to the lunatic asylum. While this might naturally happen to a man who had been besieged by the flop-over button brigade, yet it was not the result in my case. When I fell upon the floor in a state of insensibility a policeman rushed in, hastily placed me in a hand cart and trundled me off to the police court. Here he made the unfounded charge of habitual drunkenness against me, and the magistrate forthwith committed me to an inebriate asylum until such times as my habits should be reformed. Think what an outrage this was! A free and enlightened American citizen, of good moral character, of rare intellect, refined, cultivated, with occasional gleams of transcendent genius, industrious, frugal and abstemious, committed to an inebriate asylum as an habitual drunkard through the devilish machinations of a snub-nose, freckled, Irish office boy with a red head. It was infamous—an act of injustice and persecution for which I should demand redress from the national government were it not for the fact that in the seclusion thus involuntarily forced upon me, I was enabled to mature and put in form some of those grand ideas that have tortured my gigantic intellect for many years, and of which some faint glimmerings have been conveyed to an impatient public in my letters to *The Circular*.

At the asylum I found many congenial spirits—men of almost infinite intelligence—whose brains teemed with rare and philanthropic ideas, to give practical shape to which would be to enfranchise the human race, and lift it to a higher plane of intellectuality and spiritual happiness. Daily intercourse with these incarcerated geniuses gave me renewed hope and courage, and enabled me to give shape and form to many of my own benevolent and industrial plans. These poor imprisoned geniuses were, like myself, confined through a mistake; the world said we were habitual drunkards and must be restrained of our liberties; as a matter of fact we were philosophers, whose ideas were many years in advance of our time; what was regarded by the worldly as beastly intoxication was simply spiritual exaltation; conduct that was deemed evidence of drunkenness was simply the eccentricity of genius manifesting itself in ways incomprehensible to ordinary men. The world did not appreciate us and so placed us under restraint. In the asylum we were treated—Oh! the humiliation of it!—as common drunkards, and efforts were made for our reclamation. Of course, I needed no efforts of this kind, for my habits, with occasional lapses, had always been temperate. Nevertheless, I accepted the treatment in a spirit of investigation and was amply rewarded. I was benefitted by it physically, and also ascertained precisely how much spiritual comfort I can imbibe with safety. There is no danger of my ever becoming a drunkard for the treatment at the asylum demonstrated the precise amonnt of cheering beverage I can carry without befogging my intellect or entangling my organs of locomotion. Therefore, I am safe for the future, and if in the past there have been those who distrusted my capacity, they need have no doubts of me hereafter, for I have ascertained to a finger how much I can take without disturbing my equilibrium. Out of evil good sometimes comes, and out of the malicious proclivities of that son of Erin with Skaneateles hued hair, has come to me this knowledge of my capacity, and beyond this limit Aristarchius Plumbago will never pass.

So much in explanation of the past and my long silence; now for the future. I have been released from the asylum as cured; my friends need have no further apprehensions for my future, but may entrust me with their funds with all the confidence of olden times. I now have a practical proposition to submit to them. In *The Circular* of last month there appeared a notice of a new watch movement which you termed the bicycle movement, said to have been invented by some German. You also appeal to me to come to the front and become sponsor for the commercial fortunes of this new discovery. You are in error in attributing this invention to a German—I, Aristarchius Plumbago, am the designer of this movement that is to revolutionize the watch industry of the world. In this colossal brain was the revolution hatched. I had intended to keep the matter secret for a time, but the ubiquitous press has discovered it; but why you should give credit to a German I do not understand. Probably this was intended as another slap at Chicago, of which wonderfully enterprising city I am now a resident. It is a habit you Eastern men have fallen into of belittling and discrediting everything that originates in Chicago, and I suppose this was another illustration of your petty jealousy; you had rather credit an unknown German with this magnificent invention than give it to a resident of Chicago to whom it rightfully belongs.

But this bicycle movement is, as you

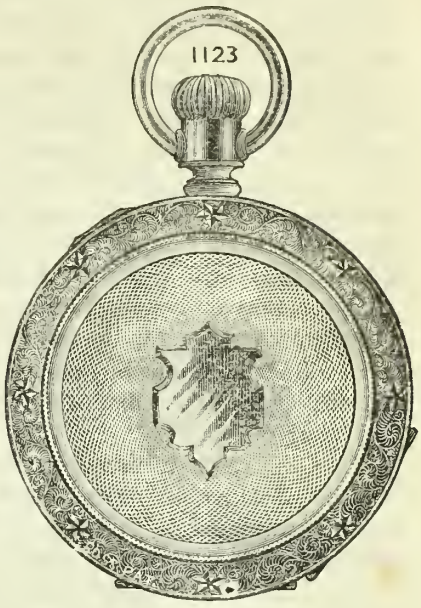
justly said, destined to revolutionize the watch making industry of the world. It has but two wheels, a large and small one, so that the term "bicycle" that you applied to it in evident derision is entirely appropriate. With these two wheels, simple as they may seem and impossible as it may appear, this movement accomplishes everything that has ever been accomplished by the most complicated and costly movement. It is a perfect timekeeper, marks the hours, minutes, seconds and eighths, is an accurate stop watch, has a calendar that records the months and days of the year, chimes the hours and quarters, indicates the changes in the moon, records the fluctuations of stock in Wall Street, is a burglar alarm and a fire extinguisher, and, in short, can be applied to almost any useful and necessary purpose. It is an axiom that almost anything can be done by machinery; how to simplify the machinery has been the problem that scientists have puzzled over since the world was formed. The bicycle watch movement cuts the Gordion knot and supplies the long-lost and eagerly sought for missing link that connects mechanical ideas with accomplished results. And this is the fruit of my intellect wrought out in the solitude of an inebriate asylum with kindly suggestions from my fellow philosophers in confinement.

Having perfected the bicycle movement, the next question that presented itself was how to manufacture them and introduce them to the public. This problem I have also solved. During my involuntary retirement from the gaze of the world, I had an opportunity to study and appreciate the fertility of resources possessed by those whom an unfeeling public place under restraint. I perused the statistics of the State prisons, the lunatic and inebriate asylums, the workhouses and all those public institutions misnamed charitable, and I soon became convinced that there is more genius, talent, mechanical skill and general ability, to say nothing of good morals and personal piety, confined within the walls of these retreats than there are outside of them—in short, that the better part of our population is, owing to peculiarities of genius or temperament, restrained of its liberty—that it is to be found, in fact, among prisoners; those who are classified as convicts or as unfortunate incompetents. So I have resolved that the bicycle watch movement shall be made by what is commonly called convict labour. Look at the convicts in our State prisons—who so competent to work in brass as the men who are provided with such an unlimited quantity of it? If you want an escapement, convicts are constantly devising them; they have known all about piuious from the time of their first arrest; while as for cases, they are all hard cases. From every point of view, convict labor is the best that can be found for the production of watch movements and cases. Then, too, as soon as the bicycle movement is introduced, all the skilled workmen now employed in the various watch factories will be thrown out of employment, and will naturally drift into the workhouses and prisons, so that our labour resources will constantly increase. It will be a simple matter to contract with the different states and municipalities for all the restrained labour we may desire, and this, too, at such low rates as will effectually preclude the possibility of competition. We see daily illustrations of the great wealth accumulated by those contractors who employ convict labour in the manufacture of articles in the sale of which there is great competition; how much more readily wealth can be rolled up when such labour is employed in the production of such an article as the bicycle watch movement, a monopoly, against which there can be no competition.



This is a brief outline of my present scheme. I have the movement that is to drive all others from the field; I have shown where the mechanical labour for its production is to be obtained; the commercial part of the undertaking, selling the goods and handling the funds, I reserve for myself. This is right, of course; being the inventor I should have the manipulation of all money derived from it; stockholders will receive their dividends after the inventor has been properly and satisfactorily compensated. What I now want is a small sum of money to enable me to make contracts for convict labour, buy material and maintain myself in a becoming manner while doing so. I have, therefore, organized a stock company with a capital of $250,000, one half to be paid in at once, the remainder to be subject to the call of the president of the company, to which office I have elected myself. Now here is something for the trade to take hold of; a real, genuine, bona-fide enterprise which they must either control or be ruined by it. When the bicycle watch is once on the market their will be no sale for any others; dealers must have them; it is better for them, therefore, to buy the stock and share the profits of the manufacture than attempt to buck against the inevitable. Shares will be issued of $100—I make them small so as to interest the trade in general—and every dealer buying one or more shares will have special privileges, such privileges to be governed by the amount of stock he buys. If he buys one share and pays $50 cash, he will have the privilege of buying as many watches complete as he may want at the regular price to retail dealers; if he takes $500 worth of stock he will be regarded as a jobber, and can have the bicycle watches ten per cent. less than the retail dealer; if he takes $1,000 of stock he can have the goods at twenty per cent. off price to retailers. All the stock is for sale; I do not care to retain any for myself, but desire to see the trade reap the benefit of my invention. By the constitution and by-laws of the company the president is made general manager, treasurer and secretary, and these officers constitute the board of directors. The board of directors has elected the perpetual president, so that it is not necessary for me to hold any stock. Shares are now ready to be delivered, and dealers should not miss this opportunity to obtain control of an enterprise that must inevitably revolutionize the watch making industry of the world. I have not yet fixed upon the price to be charged for the bicycle movement, but it will be so low that it will astonish the manufacturers of even the cheapest watches now known. With the bicycle movement made by convict cheap labor, no limit can be placed upon the wealth that may be accumulated by the stockholders in this company. As soon as I have got this company well established, I shall go to Europe for the purpose of introducing the bicycle movement there. In every country of Europe I shall organize a company and utilize convict labour. Here is a new field for the exercise of my genius that has never been carefully worked according to my plan. I only await the sale of a few shares of stock for cash to commence operations. I propose to personally visit retail dealers and verbally demonstrate the advantages they will derive from taking stock in the company. I want every dealer in the

WHOLESALE HOUSES

country to become interested; if $250,000 of stock is not enough to go around it can easily be increased at any time; it only involves the cost of paper and printing. I am particularly in need of a small amount of funds just at present, and, therefore, make this liberal offer; who-first sends in $100 for stock in the bicycle watch movement company, shall receive 500 extra shares as a gratuity. This is an opportunity no one should miss while but one person can reap the benefit of it. Who will be the fortunate person to send in the first $100? Inquiringly and bicycularly yours,

ARISTARCHIUS PLUMBAGO.

P. S.—I forgot to mention that the bicycle movement is particularly well adapted to running a sewing machine, or to act as governor for a steam engine; it will also do the washing and ironing for a small family, or may be adjusted to rock a cradle or brush flies from the dinner table. It is an exceedingly handy thing to have in the house, besides being the most accurate timekeeper known.

ARISTARCHIUS P.

BUSINESS CHANGES FOR MAY.

J. C. Bolster, jeweler, Sarnia, Ont., going out of business; Gordon & Ellis, hardware, Simcoe, Ont., dissolved, F. Gordon continues; Davis & Petley, jewelers, Lindsay, Ont., dissolved, S. J. Petley continues; A. V. Galbraith, jewelry, Shelbourne, Ont., burned out; R. C. Bothwell, jewelry and fancy goods, Toronto, assigned in trust; Jackson & Halliday, hardware, Brussels, Ont., dissolved, W. Jackson continues; H. Benham, jeweler, Toronto, admitted J. H. Gregor as a partner, style, Benham & Gregor; W. R. Anderson & Co., hardware, Collingwood, Ont., burned out; McKee & Davidson, hardware, Peterboro', Ont., dissolved, R. B. McKee continues.

BUSINESS NOTES.

MR. H. SMITH, of the firm of Smith & Fudger, sailed for Europe last week. THE TRADER wishes him a pleasant voyage and safe return.

S. T. CULP is so busy selling his patent moter now-a-days that he has no time to eat, and very little for sleep. He is making it go, and will probably make half a million dollars out of it before he gets through. This patent motor business is a long way ahead of jewelry these dull times.

WE had a visit last week from Mr. Fogg, the genial representative of the Boss and Keystone Case Company. He says their business, in spite of the dull times, is flourishing, and they are as busy as they care to be. This is one of the beauties of making a good article that people have confidence in.

A HAMILTON commerical traveler left $100 under his pillow at the Walker house, Toronto, a few days ago. The honest chambermaid placed it in safe hands, and when he rushed in some hours later with every hair on end and found his money safe, his feelings so overcame him that he forgot himself and gave the girl a dollar.

MR. JOHN W. CAMPBELL, formerly with McNaught & Lowe, has gone back on the jewelry business and bought an interest in the Culp motor, which he proposes to run in Rochester, Buffalo, Cleveland, and several other places. We rather think John W. has struck ile this time, and wish him success in his new venture.

ON the morning of May 3rd, as the night express was crossing to Point Edward, Detective Collier, of the Canadian Custom-house, discovered three large trunks filled with gold watches, jewelery, silks, and cashmeres. Twenty-five yards of fine silk were also found concealed in the lining of an old overcoat. The trunk belonged to two strangers, who, upon being detected, jumped from the train and escaped in the darkness.

OBSERVE the progress of liberal ideas in commerce! A clothing dealer in St. Louis having lately offered to give a stem winding watch to every buyer of a suit of clothes, his next-door neighbor, who is a jeweler, has revenged himself by offering to give a suit of clothes to every purchaser of a stem-winding watch. And still we wonder at crime.

THE watch business seems to be booming if one might judge from the number of new price lists of these goods that are being sent out to the trade. McNaught & Lowe have just issued a very concise and handy list of Hampden movements and silver and gold cases which will be found specially useful for pocket reference. P. W. Ellis & Co. are just out with their new catalogue of Waltham and Elgin watches and cases, which is very neatly done up in book form, and certainly a credit to the compilers.

MESSRS. John Kerry, president, Thos. White, M. P., and J. B. Rolland, members of the Montreal Board of Trade, with members of the Commercial Travellers' Association of that city, went last month to Quebec as a deputation to solicit the Government to repeal the law that imposes an annual license fee of sixty dollars on all travellers from outside doing business in the capital. This has been a standing grievance for a long time, and in these modern days should be swept away. A great many expensive law suits have arisen out of the impost.

NOT before it was time a new express company has been started in connection with the Canadian Pacific Railway and Vickers' express for the purpose of forwarding parcels to any part of the North-West. This new Company proposes to take packages via Owen Sound and Port Arthur, and require no invoice or bonding charges as under the old system. To any person who has had experience of the delay, impertinence and expense of shipping by the American Express Company, this new departure will be hailed with the utmost satisfaction, and THE TRADER for one wishes the new express company a long and prosperous career.

WE are sorry to learn that Mr. W. H. Davy, jeweler of Chatham, Ont., was badly injured by the falling of a grand stand at the athletic sports, held at that city on the Queen's Birthday. Mr. Davy, we understand, had his wrist broken, and having had a personal experience of the same thing the editor of THE TRADER is in a position to sympathise with him. We wish him a speedy recovery, that is of course unless he has an accident policy that will bring him in fifty dollars a week, in which case we would advise him to let it heal as slowly as possible.

THERE are many gentlemen in New York who thought they "knew it all" a month ago and believed themselves solid capitalists. To-day they sing sadly with Hans Breitmann :—

O vot is all dis eartly bliss,
And vot is man's sooccess?
And vot is various oder dings,
And what is habbiness?

We make deposits in a pank,
Straightway the pank is preak,
We fall and smash our outsides in
Vere we a den sdrike make.

Dull and all as Canadian jewelery business is, it is ahead of Wall street brokering in panic times.

ONE Saturday night last month, a Windsor policeman saw two strangers loitering about Lowe & Co.'s jewelry store, occasionally peering into the windows. The pair separated, and one of them went up the street, broke into Craig's blacksmith shop, and stole a hammer and other tools. When they met again they were seized by officers and taken to the lock-up, where a lot of burglars' tools, consisting of drills, files, punches, gunpowder and fuse were found upon them. Seven fine steel saws were extracted from the undershirt of one of the men. They gave their names as John Harrison and John McCarney, of Toronto. They were committed to Sandwich jail for examination. On the way to the lock-up Harrison threw a revolver into the ditch.

WE have just received from the publisher, Mr. A. Fischer, of London, England, a copy of his new trade directory of watch and clock makers and jewelers and silversmiths of Great Britain and her colonies. This work, which is neatly bound in crimson cloth, a kind of jewelry Dun Wiman without the financial or credit ratings, is a most complete thing of its kind, and strongly verifies the truth of the old saying: "There's life in the old land yet." Like any other directory which treats of England, London occupies the lion's share, the names alone of that city's dealers in jewelry occupying no less a space than 32 pages. Birmingham follows next in order with 7 pages; hardly a fair method of comparison, as the jewelry trade of Birmingham probably aggregates as much as that of the world's capital. This book is the first of the kind that we have ever seen issued of Canadian jewelers, and speaks volumes for the enterprise of the publisher. The only pity is that Mr. Fischer did not get his information up to a later date, instead of being put off with three year old lists. So far as we know this fault is only in connection with Canada, and we trust he will remedy it in future editions.

WORKSHOP NOTES.

CLEANING SILVER.—To produce a frosted surface upon polished silver use cyanide of potassium with a brush; the silver should not be handled during the process, but held between pieces of boxwood or lancewood. The proportion should be one ounce of cyanide of potassium to one pint of water. But be cautious, since the stuff is very poisonous.

TRANSPARENT CEMENT.—A good transparent cement for fastening watch glasses, etc., in bezels or settings is made by dissolving 7 parts of clear gum arabic and 3 parts crystalized sugar in distilled water; the bottle containing the mixture should be placed in a utensil of hot water until the mixture assumes the consistency of syrup. and then left well corked for use.

REDUCING DIAMETER OF A WATCH GLASS.—The diameter of a watch glass can be reduced by centering in a lathe, chucking it between two pieces of cork, or a pair of cork arbors, and applying a moistened piece of glass to the edge, or an emery stick. When the desired diameter is attained, polish the edge with pumice stone, followed by putty powder applied on a wet cork.

CLEANING BRONZE.—A very good recipe for cleaning bronze, steel, brass,etc., and one I have used with great success in cleaning gas holders, troughs, etc., is as follows: Take 1 ounce of oxalic acid, 6 ounces rotten stone, ½ ounce gum arabic in powder, 1 ounce sweet oil, and a sufficient quantity of water to make a paste. Apply a small portion to the article and polish with a flannel or a piece of soft leather.

ELECTRO BRASS PLATING.—Mr. J. J. Heoz uses the following bath, which differs materially from former formulæ; 84 grains sodium bicarbonate, 54 grains ammonium chloride, and 13 grains potassium cyanide are dissolved in 2 liters of water. To render the bath active the sides of the bath are covered with a sheet of brass, which serves as anode, while another piece of brass hangs in the bath and forms the cathode. The current is allowed to pass through the bath for 1 hour, after which it is ready for use. It is better to use cast brass.

TO STRAIGHTEN A STEEL ROD.—When the rod is short use a large pair of sliding tongs or a hand vice, the jaws of which have been softened in order to make a groove in each parallel to the edge. Placing the rod in the cylindrical recess thus formed between the jaws, fix one side of the hand vise in a bench vise, holding a spirit lamp near the jaws, and as the steel changes its color, tighten the slide or screw of the former. When the metal assumes a blue color, and the jaws are as tight as possible, remove the lamp, allowing the whole to cool slowly or by applying water. The jaws should be formed so as to bend the rod rather more than is ultimately required, because steel, on being released is apt to partially recover its initial curvature. When the rod is long, grip its two ends in the frame of a fret-saw, which should be somewhat strong. Then hold a lamp under the rod, at the same time stretching the steel more and more, and allow the steel to remain stretched until quite cold. If it has been sufficiently stretched the metal will be rendered perfectly straight.

OTHER NOTES.

AN engraver in Versailles, whose name is not given, is said to affirm that he has discovered a method for taking photographs in colours, being able thus to reproduce the colours of the individual or landscape photographed.

A MILWAUKEE man has been digging for diamonds in the gravel strata near Waukesha, Wis. He found what is spoken of as a "splendid specimen" last week, and another not so perfect in crystallization. He is also reported to have found good specimens of other stones. Make way for the diamond boom.

The finest rubies are found in Java, Siam, and Peru; others are found in India, Ceylon, Australia, Borneo, and Sumatra. The Burmese mines have long been famous; the working of them is a royal monopoly, and the King has among other titles that of Lord of the Rubies. The Brazilian ruby is declared to be a pink topaz, inferior to the true ruby, yellow in its natural state, and coloured artificially.
